Ocular Symptoms in Fracture of Skull.—Larsen reports 17 cases of fracture of the skull examined from three months to three years after the trauma because of which ocular changes originated or are thought to have originated. The changes after theca fractures (except fractures of the frontal bone) were anomalies of refraction not previously recognized. In cases with fracture of the base of the skull, when there had been lesion of the optic nerve, which is frequent, there was apparently a characteristic field of vision in addition to the known changes of the pupil in atrophy of the optic nerve: (1) limitation of the upper field of vision, (2) limitation of the temporal field of vision and (3) central scotoma. The lower and nasal fields of vision were only slightly decreased. While the narrowing of the outer borders of the field of vision apparently occur directly after the lesion, some time seems to elapse before central scotoma appears, so that it is probably to be regarded as a result of the reparatory processes (yielding pressure on the optic nerve by the fibrous tissue, which, instead of callus, binds the cranial bones). The author says that the diagnosis of fracture of the base of the skull can probably be made on the basis of this complex alone—central scotoma accompanied by severe upper and temporal defects in the field of vision.

Finska Läkaresällskapetets Handlingar

- *Bone Marrow Picture in Acute Infections. J. Forssell.—p. 2339.

Bone Marrow in Acute Infections.—Forssell refers to his earlier work on morphologic changes in the bone marrow in acute anemias due to hemorrhage and now reports on the results of his examinations in eleven cases of acute infection of the genital tract of brief duration, without noteworthy anemia. No shifting beyond the normal could be established in the granulocyte picture of the bone marrow in any of these cases, which, he asserts, confirms his conclusions that acute hemorrhages and not infections cause a shifting to the left in the granulocyte picture in the bone marrow and a neutrophilia of the bone marrow. The erythrocyte leukocyte quotient was greatly decreased by the infection, pointing to stimulation of leukocyte proliferation. No changes could be demonstrated in the size of the red blood corpuscles and none in the hemoglobin concentration of the cells. The number of eosinophil cells was reduced not only in the blood but in the bone marrow. In a case in which there was grave infection of longer duration the neutrophil cells with segmented nuclei almost disappeared from the bone marrow, while the number of myelocytes and promyelocytes increased.

Hygiea

- *Subdural Hematoma. E. Ask-Upmark.—p. 2357.

Subdural Hematoma.—Ask-Upmark discusses the occurrence, pathologic anatomy, pathophysiology, clinical symptomatology and therapy of subdural hematomas on the basis of personal observations in about 40 cases. In these expansive intracranial processes, he says, the separate symptoms are often less characteristic than the general course, which is marked by (1) a history of trauma, (2) a relatively long free period and (3) intermittent periodicity in the symptoms. In the more acute cases, treated not long after the trauma, there is less danger of overlooking the trauma than in the more chronic cases, which appear for treatment in divisions of internal medicine, neurology and psychiatry. In the acute cases the free interval is shorter or may be absent. In the classic cases of chronic subdural hematomas the interval between the trauma and the onset of symptoms may be from weeks to months and years, sometimes several years, and the symptomatology is perhaps more shifting and bizarre than in any other neurologic disorder. There may be symptoms of increased intracranial pressure, in most cases more or less conspicuous mental symptoms, neurologic symptoms mainly of motor kind, and not seldom bradycardia, believed to depend on increased intracranial pressure but occasionally registered when the intracranial pressure is not increased. Examination of the cerebrospinal fluid is best made by suboccipital puncture. If this is not possible, lumbar puncture may be considered; but the diagnostic value of examination of the cerebrospinal fluid is limited by it and in suspected expansive intracranial processes lumbar puncture is as a rule contraindicated. Roentgen examination of the cranium is of value only in exceptional cases. Encephalography or ventriculography affords valuable information. Arteriography gives an especially clear picture; but the method requires a considerable intervention, and simpler means generally suffice for diagnosis and treatment. Operation consists in removal of the hematoma through a transtemporal trepanation opening, which can often be small. Preoperatively, rest and quiet are needed, as there is often psychic or motor agitation, abundant administration of fluids is called for and a timely blood transfusion is often important. Exsiccation and overheating dispose to general hyperthermia. Tachycardia is a noticeable feature in neurogenic hyperthermia and it seems to the author logical to try treatment with ergotamine tartrate (gynergen) or a prostigmine preparation for it. As a rule the postoperative course is uneventful. If this is not the case, the possibility of a subdural hematoma on the other side is to be considered.

CORRECTION

Estrogen and Calcium in Menopause.—In the abstract "Estrogen and Calcium in Menopause" (THE JOURNAL, April 19, p. 1878) the dose of calcium lactate should have read 0.25 Gm. instead of 0.00025 Gm., and the dose of sodium bromide 0.05 Gm. instead of 0.000005 Gm.

Book Notices

The Parasites of Man in Temperate Climates. By Thomas W. M. Cameron, Professor of Parasitology, McGill University, Montreal. Cloth. Price, \$3. Pp. 182, with illustrations. Toronto: University of Toronto Press; London: Oxford University Press, 1940.

This book is based on the course in parasitology given in the medical school of McGill University. Its contents are deliberately restricted to the needs of the practitioner in the English speaking temperate and subtropical areas with no attempt to supply the larger needs of the parasitologist or laboratory worker. There are four main sections of the book dealing with protozoa, helminths, leeches and arthropods. The section on the last group contains not only insects of medical importance but also venomous arthropods. Detailed descriptions are limited to those parasites which occur in North America and Great Britain. In each of these species a brief summary account is given of the morphology and life cycle of the parasite, various pathologic aspects of the infection, diagnosis, methods of spread and treatment. Some readers will undoubtedly feel that the discussion of some aspects of the subject should have been more adequately treated. Within the aims and physical limits of space set by the author, however, he has done remarkably well. The book is well written and illustrated and is accurate in subject matter.

America Organizes Medicine. By Michael M. Davis, Chairman, Committee on Research in Medical Economics. Cloth. Price, \$3. Pp. 335. New York & London: Harper & Brothers, 1941.

Before offering adverse criticisms it should be said that this book contains so much valuable material on medical economics as to entitle it to careful reading by every one interested in this subject. So far as the book has a central theme it seems to be that medicine is moving toward more and more organization. Developments are presented with more emphasis laid on the activities of medical societies and consumer organizations than on compulsory sickness insurance. However, the strong bias against organized medicine and in favor of what might be called the social service point of view is dominant. The statements of the Committee on the Costs of Medical Care and the Interdepartmental Committee and the National Health Conference are accepted as authoritative.

The subject of the quality of care as a test of the value of any method of supplying medical care is carefully avoided. By implication, at least, the test of morbidity and mortality rates is discarded, although this is the only test properly applied to all phases of medical care. Instead it is urged that some sort of "realistic standards" be established, which appears to mean those of the number of visits, days of care, and so on, all of which have been tested and found practically useless in systems of compulsory sickness insurance. The study by Miss Swackhamer on free choice is quoted without including her comment that the study was in a "slum" district with a large percentage of immigrants, which is in no sense typical. The dictators' argument that people given free choice do not always choose wisely is used; there is no mention of the potential value of such choice in controlling standards.

Some of the references to the American Medical Association contain unpardonable misstatements. For example, page 164: "Its Council on Medical Education and Hospitals inspects institutions of 75 beds and over (and some smaller ones)." The fact is that a large majority of the hospitals inspected and registered have less than seventy-five beds. The average for 1,633 "proprietary" hospitals registered in 1940 is less than fifty beds. He finds a nonexistent conflict between "state and local medical societies" and the "national body," disregarding the fact that the "national body" has no existence aside from the "state and local medical societies." The comments, page 176, on the attitude of the American Medical Association toward British health insurance are extremely misleading. The statement frequently repeated that criticism of methods of organizing medical care are always from the economic point of view is wholly false. An examination of the official statements and actions of the A. M. A. shows that criticisms are directed to effects on the quality of the medical service and never on the economic phases.

Tratado de diagnóstico quirúrgico. Por Adolfo Recceus E. Paper. Pp. 877, with 1,095 illustrations. Santiago, Chile: Central de Publicaciones, 1940.

This book is based on the author's wide experience in the surgical wards of the hospitals of Valparaiso, especially during the last twelve years. Although the clinical diagnosis should prevail over the roentgen, the proper knowledge of roentgenology is paramount for the exact interpretation of the roentgenograms. The majority of roentgenograms in the book are of patients observed by the author. The book is divided into eight chapters, on surgical diseases of (1) the cranium and cranial cavity, (2) the face and mouth, (3) the neck, (4) the thorax, (5) the abdomen, (6) the urogenital organs, (7) the spine, bone marrow and pelvis and (8) the extremities. The fields covered in the different chapters include: 1. Cranial trauma with or without cerebral complications, cranial trauma in the newborn, congenital and other tumors, hydrocephalus, malformations, tumors, epilepsy, exophthalmos, pathology of the cerebral nerves, craniocerebral topography, osteitis and inflammation of the brain and meninges. 2. Congenital malformations, inflammation, tumors, neuralgia, cysts, pathology and fractures of the maxilla and diseases of the salivary glands. 3. Congenital malformations, torticollis, cervical ribs, inflammation, tumors and pathology of the regional lymph nodes and thyroids. 4. Pathology of the wall of the mamma, surgical diseases of the pleura, lungs and mediastinum, inflammation and hydatid cyst of the lung, tumors of the lung and mediastinum and diseases of the heart, pericardium, esophagus and diaphragm. 5. Trauma, surgical diseases, hernia, pathology of the peritoneum, surgical pathology of the stomach and duodenum, peptic and duodenal ulcer, tumors, congenital diseases of the intestine, acute and chronic appendicitis, intestinal tuberculosis, intestinal complications of typhoid demanding surgical interventions, diverticula, tumors and intestinal occlusion, and surgical diseases of the liver, biliary tract, pancreas, spleen and anorectal region. 6. For the urogenital structures, surgical diseases of the kidneys and ureters, and pathology of the adrenals, bladder, prostate, urethra, scrotum, testicle, epididymis, vas deferens and penis. 7. For the spine, bone marrow and pelvis, malformation of and trauma on spine, trauma on bone marrow, Pott's disease, spondylosis, spondylitis, tumors, acquired deformities, topographic diagnosis of medullary lesions, compression of the bone marrow by tumors and diseases of the pelvis. 8. For the limbs, congenital and acquired malformations, luxations and fractures, diseases of the soft parts, lesions of the nerves of the limbs, of the bones, of the soft parts and joints, diseases of the bones and joints, dystrophy of the bones, inflammation, chronic and infectious diseases of the joints, local necrosis and other local diseases, and free bodies in joints.

Basic Principles of Healthful Housing. Second edition. Paper. Price, 25 cents. Pp. 32. American Public Health Association, Committee on the Hygiene of Housing, C.-E. A. Winslow, Chairman. New Haven Conn., 1939.

This is a report from the Committee on the Hygiene of Housing of the American Public Health Association and has been endorsed by the Association's Committee on Research and Standards so that it may be released for further study. It contains chapters on physiologic needs which can be met by proper housing, such as temperature, pure air, proper lighting, protection against noise, and adequate space for exercise. It then lists fundamental psychologic needs, such as privacy, opportunities for normal family and community life, facilities for performances of household tasks, the maintenance of friendliness, the achievement of esthetic satisfactions, and conformance with social standards of the community. Protection against contagion includes the provision of safe water available to the dwelling and protection against pollution within the dwelling, proper toilet facilities, the avoidance of insanitary conditions in the vicinity, the exclusion of vermin and all further necessities. There must also be provision for keeping milk and food undecomposed. Sleeping rooms must provide sufficient space to minimize the danger of contact infection. Accident safeguards enumerated include proper planning, use of appropriate materials, fire-proofing, fire-escape facilities, protection against electrical shocks and burns and against gas poisonings, and protection against falls, mechanical injuries and neighborhood

automobile traffic. Each is made the subject of a "principle," of which there are thirty. Each principle is elucidated by one or more paragraphs sufficiently detailed to make clear what is intended. The pamphlet is enclosed in attractive covers with plastic ring binding. It should be useful to any one interested in housing, from the prospective owner to the official charged with community housing standards and their enforcement.

Memoria y cuenta del Ministerio de sanidad y asistencia social, Estados Unidos de Venezuela (contiene las actuaciones correspondientes al año civil de 1939). Paper. Pp. 404, with illustrations. Caracas, 1940.

The author of this book is the minister of public health and hygiene of Venezuela. The book is a report of work carried on by the various branches of the ministry in the course of 1939. It contains several chapters on the organization and functions of the body of sanitation, and hygiene and its various branches, especially for the welfare of mothers and their children, hygiene of crèches, reformatories for delinquent youths, vacationing centers for children, care of school children, social work, prevention and therapy of tuberculosis, venereal diseases, malaria, yellow fever and other diseases, propaganda, services rendered to the people by means of legal and medical consultations, vigilance of medical professions and of pharmacies, work carried on by the Instituto Nacional de Higiene and other sanitary centers, care of centers for preventing delinquency in youth, sanatoriums, hospitals and leprosaries and public dining or sleeping rooms for needy children. The problems of sanitation of the soil and housing also are discussed. The book contains illustrations, epidemiologic graphic drawings, statistics, lists of the Venezuelan physicians and other professionals who were registered in the course of 1939 and a detailed report of the income and expenses of the General Department of Public Health and its branches during the year. In his preface the author calls for cooperation of the federal and municipal authorities and civilians of Venezuela in order to carry on collective efforts. Actually Venezuelan sanitation and hygiene are constantly progressing.

Macleod's Physiology in Modern Medicine. Edited by Philip Bard, Professor of Physiology, Johns Hopkins University School of Medicine, Baltimore. With the collaboration of Henry C. Bazett, Professor of Physiology, University of Pennsylvania, et al. Ninth edition. Cloth. Price, \$10. Pp. 1,256, with 387 illustrations. St. Louis: C. V. Mosby Company, 1941.

When it first appeared in 1918, the book by Macleod was recognized at once as a distinguished contribution. Now after twenty-three years the ninth edition becomes available as a massive work, entirely rewritten by a group of authors, many of them specialists in certain major fields of physiology. In addition to the contributors who developed the eighth edition, there are Howard J. Curtis, who has rewritten the chapters on electrical excitation and conduction of the nerve impulse, and Dr. Walter S. Root, who has contributed a chapter on the urinary bladder. Originally developed as a reflection of the physiology of the University of Toronto, the book now emanates primarily from Johns Hopkins University, where its distinguished editor is professor of physiology. It is a comprehensive, reliable textbook, which has been kept quite up to date. The scope of the numerous additions becomes apparent in the bibliography and becomes even more clearly apparent in the extent to which various portions of the type have been worn by repeated printing.

Las perturbaciones hepáticas en los enfermos de tirotoxicosis. Por el Dr. Adolfo Marcos Rey. Tesis de doctorado, Universidad nacional de Buenos Aires, Facultad de ciencias médicas, Escuela de medicina. Núm. 5208. Paper. Pp. 89, with 23 illustrations. Buenos Aires: Sebastián de Amorrotu e Hijos, 1940.

The author selected the subject of disturbances of the liver in thyrotoxicosis for his doctoral thesis. The book is divided into five chapters, on relations between disturbances of the liver and thyrotoxicosis, functions of the liver, variations of liver glycogen and anatomopathologic changes in thyrotoxicosis and influence of pathologic changes of liver on morbidity and postoperative mortality in thyrotoxicosis. The book is an exposition of the development and present knowledge of the subject as seen from a review of the literature and from clinical and micropathologic observations, which were carried on by the author in the Surgical Clinic of Buenos Aires.

Following are the conclusions: The liver is either fundamentally or clinically involved in thyrotoxicosis and the glycogen of the liver is diminished. The functions of the liver improve or become normal and the clinical symptoms improve or disappear when improvement or cure is attained by surgical operation in cases of thyrotoxicosis. A plausible cause of the liver involvement is a lability of the structure from thyroid hormone or its derivative toxic substances. The pathologic alterations of the liver in thyrotoxicosis are important factors which have an influence on the morbidity and postoperative mortality of thyrotoxicosis.

El hemoneumotorax espontaneo. Por el Dr. Jorge M. Remolar. Tesis de doctorado, Universidad nacional de Buenos Aires, Facultad de ciencias médicas, Escuela de medicina. Acta No. 5324. Paper. Pp. 159, with 33 illustrations. Buenos Aires: Aniceto Lopez, 1940.

The author of this book selected the subject of Spontaneous Hemopneumothorax, in which he has a large experience, for his doctoral thesis. In an introductory chapter he discusses spontaneous hemopneumothorax, the importance of the various forms of the condition and the relation between spontaneous pneumothorax and spontaneous hemopneumothorax. A review of the literature, especially Argentine literature, on the subject is covered in chapters 2 and 3, which include a clinical and roentgen study of cases observed and treated by the author. The symptoms, clinical forms, differential diagnosis, course, prognosis and therapy of spontaneous hemopneumothorax are discussed in chapters 4, 5, 7 and 8. In chapter 6 the author deals with the history, pathologic anatomy and roentgen aspects of subpleural blebs, the pathogenic role of subpleural blebs, the importance of pleuroscopy and pleurophotography in spontaneous hemopneumothorax and the histology of the conditions. The book contains many roentgenograms, photomicrographs and neat illustrations in color.

An Introduction to Dermatology. By Richard L. Sutton, M.D., Sc.D., LL.D., and Richard L. Sutton Jr., A.M., M.D., LL.R.C.P., Assistant Professor of Dermatology, University of Kansas School of Medicine, Kansas City. Fourth edition. Cloth. Price, \$9. Pp. 904, with 723 illustrations. St. Louis: C. V. Mosby Company, 1941.

The first edition of this book appeared in 1932. The present edition has been condensed from the tenth edition of the well known book on "Diseases of the Skin" by the same authors. The literature has been brought quite up to date, the number of illustrations has been more than trebled, and all of the type has been reset. The reputé of the authors in their chosen field makes it possible for them to secure contributions of much new material from other distinguished dermatologists. As a textbook for students, this volume is to be especially recommended because of its intensely practical character, the succinct manner of presentation of the material and the excellence of the illustrations, both in form and in printing.

State Board Questions and Answers for Nurses. Essay and Objective Types. Compiled from Actual Examination Questions Given Throughout the Country by State Examining Boards. Nineteenth edition, 1941 revision. Cloth. Price, \$3.50. Pp. 1,084. Philadelphia, Montreal & London: J. B. Lippincott Company, 1941.

This book contains answers to hundreds of questions which were asked by nurses' examining boards throughout the country last year. The editorial board which answers these questions comprises eleven nurses or instructors in high positions in well known institutions. The questions are classified under the various subjects in which nurses are examined, such as anatomy and physiology, hygiene, pharmacology, nutrition, medical nursing, surgical nursing, obstetric nursing and the nursing of children. While the book is obviously intended to help nurses who expect to take these state board examinations, it will also serve as a guide for a thorough review and as an encyclopedia of modern knowledge on nursing.

The Notifiable Diseases: Prevalence in States 1939. Federal Security Agency, United States Public Health Service. Division of Sanitary Reports and Statistics. Supplement No. 163 to the Public Health Reports. Paper. Price, 5 cents. Pp. 14. Washington, D. C.: Supt. of Doc., Government Printing Office, 1941.

This leaflet consists of tabulations indicating the spread of the communicable diseases in 1939 according to states. It is a useful reference for those to whom disease statistics are useful or significant.

Queries and Minor Notes

2639

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

MASKS FOR PROTECTION AGAINST FORMAL-
DEHYDE GAS

To the Editor:—Will you kindly give a formula for the material used to adsorb formaldehyde in the canister of a gas mask? Could dry antiformin serve this purpose?

ANSWER.—Formaldehyde gas may be adsorbed to a large degree by the special activated charcoal in the canister of the gas mask. Through various heating and steaming processes, the charcoal grains are changed so that fine, capillary-like tubes are obtained and adsorption is greatly increased. Although in the literature there has been mention of such simple filters, in industry some firms using formaldehyde prefer masks with a closed system with oxygen or with an intake tube extending out into noncontaminated air. It is rather rare, however, to obtain a toxic concentration of formaldehyde under ordinary practical conditions, in spite of the fact that there may be a danger of sodium formate being produced and then carbon monoxide being split off from the formate. Unless this mask has particular facilities for protection against carbon monoxide, the simple antiformin canister should not be used. Theoretically, the danger of the production of the carbon monoxide from formaldehyde is possible with any type of oxidizing agent.

Amour F. Liber, M.D., New York.

ASYMPTOMATIC NEUROSYPHILIS

To the Editor:—In September 1939 during a routine examination on a white woman aged 24 it was found that she had a 4 plus Kahn reaction. General physical examination revealed no abnormalities. The Wassermann test on 1 cc. of spinal fluid resulted in a 4 plus reaction. The gum mastic test gave negative results. A diagnosis of latent syphilis, probably early, with early involvement of the central nervous system, probably of a meningovascular type, was made. For the next eight months the patient was treated with alternate courses of a bismuth compound and mapharsen, receiving ten injections of the bismuth compound, 2 grains (0.12 Gm.) at each dose, and twenty-four injections of mapharsen, 0.04 Gm. per dose. At this time both Kahn and Wassermann reactions of the blood were 4 plus. The spinal fluid showed a cell count of 4 and no globulin and gave a negative reaction to gum mastic. The Wassermann reaction was negative with 0.2 cc. of fluid, 3 plus with 0.5 cc. of fluid and 4 plus with 1 cc. At that time, May 1940, the administration of tryparsamide was begun, and the patient received a total of twenty-nine injections of 2 Gm. each. In December 1940 both the Kahn and Wassermann reactions of the blood were still 4 plus. The spinal fluid showed a normal cell count and no globulin and gave a negative reaction to gum mastic. The Wassermann reaction was negative with 0.2 and 0.5 cc. of fluid but 2 plus with 1 cc. of fluid. In January 1941 the administration of a bismuth compound was begun again, it being impossible to continue with tryparsamide because of a gastric reaction. I should like your suggestions as to future procedure after a few weeks of therapy with the bismuth compound. I feel her another course of tryparsamide. Assuming that she received tryparsamide for another six months and at the end of that time the spinal fluid was normal but the blood still positive for syphilis, what would you suggest for further therapy then? I would also appreciate a comment as to the relative merits of fever therapy and tryparsamide at the present time.

M.D., Tennessee.

ANSWER.—If the September 1939 physical examination of the patient was completely normal from the neurologic standpoint, the correct diagnosis is asymptomatic neurosyphilis. In planning treatment for such a patient, it is desirable to have some idea as to the probable duration of the infection, a point concerning which no information is supplied. While it may be impossible to date the infection on the basis of a history of lesions of early syphilis, nevertheless collateral evidence, such as the duration of marriage, if any, or the length of time over which potentially infectious exposure may have occurred, would be of value. If the duration of infection was less than two years at the time of the discovery of the positive serologic reaction of the blood, it would have been desirable to intensify the arsenical phase of treatment by larger and probably more frequent doses of mapharsen. If, on the other hand, the infection was probably older than two years, the treatment so far given seems adequate.

The procedure suggested for the immediate future, namely the trial of tryparsamide after completion of the present course of

the bismuth compound, is satisfactory. It may well be that in view of the occurrence of gastrointestinal reactions during the last course of tryparsamide the patient has become permanently intolerant to this drug, though this cannot be determined without further trial. If tryparsamide is tolerated and if the patient of average weight (132 pounds, or 60 Kg.) it is suggested that the dose of tryparsamide be raised from the 2 Gm. level previously employed to the average therapeutic dose of 3 Gm. If, on the contrary, tryparsamide is not tolerated, fever therapy, preferably with induced malaria, would be desirable.

Assuming that tryparsamide can be given and that after twenty-six consecutive weekly injections the spinal fluid is normal but the serologic reaction of the blood still positive, it is suggested that for an ensuing six months treatment be continued as originally begun, with alternating courses of a trivalent arsenical in a maximum tolerated dosage (e.g. mapharsen 60 mg. instead of 40, arsphenamine 0.3 to 0.4 Gm.) and of bismuth subsalicylate in oil, each 0.2 Gm. At the end of this time the spinal fluid should be reexamined. If it is still normal, regardless of the serologic reaction of the blood, the patient may be placed on probation. There should then ensue an indefinite period of observation, during the first three to five years of which examination of the spinal fluid should be repeated at six month intervals and the blood test repeated by a satisfactory quantitative technic. From the serologic standpoint treatment need not be resumed unless there is evidence of a return of abnormalities of the spinal fluid or of a high titer serologic relapse in the blood. In addition the patient should undergo periodic physical examination with special emphasis on her neurologic status, at least at yearly intervals.

There is little satisfactory information as to the relative merits of fever therapy and tryparsamide in the treatment of neurosyphilis. The only recent papers on this particular point are by Solomon and Epstein (*Arch. Neurol. & Psychiat.* 33:1008 [May], 1216 [June] 1935). These authors conclude that in their hands the results of tryparsamide therapy are approximately as good as those obtained from malaria. Other workers in the field, however, without having presented evidence to document at any rate fever therapy is superior to tryparsamide. Finally, it should perhaps be said that in a patient with neurosyphilis of any category who cannot tolerate tryparsamide or in whom, in spite of the use of this drug in adequate amounts, abnormalities of the spinal fluid persist, fever therapy should be employed.

UTEROTUBAL INSUFFLATION AND AIR EMBOLISM

To the Editor:—Would you discuss the use of carbon dioxide or air in uterotubal insufflation. The argument, as I understand it, centers primarily around the danger of producing embolism with the use of air and secondarily around the question of the comparative degree of irritant action of the two gases. Is the danger of embolism only theoretical or have there been definite cases reported in which embolism occurred? What is the actual risk as compared to theoretical risk?

Ralph E. White, M.D., Santa Ana, Calif.

ANSWER.—The actual risk of embolism during the performance of uterotubal insufflation is practically nil, regardless of whether carbon dioxide or air is used. One case of presumable air embolism was reported by Rubin (Cumulative Supplement and Composite Index of Gynecological and Obstetrical Monographs, New York, D. Appleton & Co., 1928, p. 49). The patient had had an amputation of the cervix performed some years before. The uterus contained several fibroid tumors, one, the largest, being the size of a large apple. The tubes had been converted into large hydrosalpinges. The physician, not experienced with the test, first dilated forcibly the cervical canal, insufflated the uterus with gas and then curetted. This is the order of the operation as stated by the physician in question. The patient became cyanotic, and her respirations became embarrassed; anesthesia was not discontinued, but the operator "quickly finished" the curettage. She ceased to breathe under the anesthetic and was not resuscitated. At necropsy air was found in the pelvic veins, including those of the broad ligament, the inferior vena cava and the cavity of the heart. The tubes were occluded at the fimbriated ends. The one tube was distended with blood and air.

In this unfortunate case it may be that the injury to the cervix occasioned by forcible dilation of a stenosed cervical canal may have presented the avenue of entrance into the cervical veins and thence into the broad ligament. Some of the gas held under pressure within the uterine cavity may have entered the general circulation after the endometrium was curetted, a fact demonstrated by Sampson with his bismuth experiments and in Rubin's work. Too much stress cannot be laid on this point of the

necessity of slow, careful insufflation with gas. It is striking that in the hands of the men who have employed transuterine insufflation according to all the rules of technic and indications no such accident has occurred nor anything approaching a calamity, and the number of insufflations may now be reckoned in the thousands. Rubin has demonstrated that as much as 300 cc. of gas can be introduced into the venous system without causing any harm provided the rate of injection is slow, similar to that prescribed for transuterine insufflation.

As emphasized by Rubin, carbon dioxide has proved to be the most readily absorbed of all the available gases, but air is also satisfactory for testing tubal patency. However, regardless of which gas is injected into the uterine cavity, a pressure gage should always be used. A manometer will not only prevent the use of excessive pressure but present additional evidence of the patency or nonpatency of the tubes by the rise and fall of the pressure reading. In order to avoid any complications, uterotubal insufflation should never be performed in the presence of uterine or cervical bleeding, fever, pelvic tenderness, pelvic tumors, vaginal purulent discharge and serious cardiac or respiratory disease.

TREATMENT FOR CYANIDE POISONING

To the Editor:—A treatment for poisoning with cyanide using sodium nitrite and sodium thiosulfate has been recommended: 0.3 Gm. of sodium nitrite in 10 cc. of water given intravenously and followed by 25 to 50 cc. of a 50 per cent solution of sodium thiosulfate given intravenously. What is the status of this treatment? How should the solutions be prepared to have them sterile? Can the drug be added to boiling sterile salt solution and boiled, as is done with sulfanilamide powder? Or, again, can the powdered drug be put up in papers and autoclaved?

Gail K. Ridelsperger, M.D., Warren, Pa.

ANSWER:—Experimental work on dogs (Chen, K. J.; Rose, C. L., and Clowes, G. H. A.: Comparative Values of Several Antidotes in Cyanide Poisoning, *Am. J. M. Sc.* 188:767 [Dec.] 1934) indicates that successive injections of sodium nitrite and sodium thiosulfate give the best antidotal action to poisoning with cyanide. In dogs, this combination of drugs was found, to detoxify 20 minimum lethal doses of sodium cyanide, which was almost three times the sum of their individual values and was ten times as effective as methylene blue. As a result, the authors cited reviewed the findings of other investigators and suggested a treatment for poisoning with cyanide. Essentially it consisted in the immediate administration by inhalation of amyl nitrite for fifteen to thirty seconds, which is repeated every two or three minutes until the solutions are injected; intravenous injection of sodium nitrite (6 to 10 mg. per kilogram of body weight) at the rate of 2.5 to 5 cc. a minute, followed with sodium thiosulfate (0.5 Gm. per kilogram of body weight) at the same rate, gastric lavage if the poison has been taken by mouth, and continuous observation of the patient for at least twenty-four to forty-eight hours. Persistence of signs of poisoning or their reappearance one hour after the initial dose is an indication for repeating the dose of sodium nitrite and sodium thiosulfate, although Chen, Rose and Clowes advocate a second injection at the end of two hours for prophylaxis even if symptoms are not present. Subsequent doses should be one half of the original dose. The two drugs must not be mixed together before injection. These investigators also advise the maintenance in large hospitals of an emergency kit consisting of pearls of amyl nitrite, ampules of sodium nitrite (0.3 Gm. in 10 cc. of water), ampules of sodium thiosulfate (25 Gm. in 50 cc. of water), two sterile syringes (10 cc. and 50 cc.), a file and a stomach tube. Whereas Chen and his co-workers injected sodium cyanide subcutaneously for experimental purposes, Etteldorf (The Treatment of Gaseous Hydrocyanic Acid Poisoning by Sodium Thiosulfate and Sodium Nitrite Combination, *J. Pharmacol. & Exper. Therap.* 66:125 [May] 1939) allowed dogs to inhale the vapors from hydrocyanic acid and found that previous intravenous administration of sodium thiosulfate and sodium protected the animals against concentrations which were four to six times as great as that necessary to produce convulsions in control animals. Again, Etteldorf reported that administration of the drugs immediately after exposure to hydrocyanic gas either results in recovery or hastens it except in those cases in which convulsive concentrations of the poison had been reached. When this occurred, the treatment appeared to be valueless. Cushny, Edmunds and Gunn (Pharmacology and Therapeutics, Philadelphia, Lea & Febiger, 1940) suggest the intravenous injection of 6 to 10 mg. per kilogram of body weight of sodium nitrite in 3 per cent solution, followed by 0.5 Gm. per kilogram of body weight of sodium thiosulfate in 50 per cent solution. They also point out the value of the inhalation of amyl nitrite as a preliminary adjuvant to this treatment. Sodium thiosulfate is marketed by a number of pharmaceutic

houses. Some of these preparations have been accepted by the Council on Pharmacy and Chemistry for inclusion in New and Nonofficial Remedies and are prepared as 10 per cent solutions (1 Gm. in 10 cc. of solution). However, if it is desired to prepare the solutions as needed, the drug may be dry heated and added to freshly autoclaved distilled water, or it may be added to distilled water and the resultant solution autoclaved. If it is desired to fill a number of ampules for future use, the solution should be prepared and the ampules filled and heated to 100 C. for thirty minutes. A general discussion on the preparation of ampule solutions is contained in the National Formulary. The solution of sodium nitrite may also be prepared as needed by sterilizing the powder with dry heat and adding to autoclaved distilled water. Solutions that deteriorate when heated may be passed through a sterile clay filter candle such as is used in the Berkefeld or Chamberland type of filter, but this process does not assure positive sterility.

NO TEST FOR MARIHUANA SMOKER

To the Editor:—Is there any method of determining whether a person is under the influence of, or has smoked, marihuana recently that would be acceptable in court? If there is a test on body fluids how should the sample be taken and preserved and where is the nearest laboratory that would test it?

M.D., Montana.

ANSWER:—Although there are a number of methods for identifying cannabis (marihuana) and its derivatives (Walton, R. P.: Marihuana, Philadelphia, J. B. Lippincott Company, 1938, chapter 10, pp. 164-166) there is no dependable test for determining the presence of this drug in the blood or other body fluids. In *Queries and Minor Notes* (Mescaline, Marihuana and Cocaine, *THE JOURNAL*, Jan. 13, 1940, p. 182), in answer to a similar inquiry as to whether satisfactory laboratory tests were in existence for determining the presence of cannabis in the blood and other body fluids, it was stated "There is at present no dependable specific test which will identify cannabis or the resinous active ingredient, cannabinal. It is doubtful whether sufficient material could be extracted from the blood with chloroform for purification and examination." Until a generally accepted and dependable test for determining the presence of cannabis or its derivatives is developed, a court of law would not be disposed to admit in evidence the results of a test or an analysis of the blood or other body fluids for the purpose of determining whether or not a person had smoked, or otherwise consumed, cannabis and whether or not he was under the influence of that drug at a particular time.

CAVIAR AS POSSIBLE SOURCE OF FOOD POISONING

To the Editor:—In the case of caviar being suspected as the cause of food poisoning, what would be the significance of the following laboratory report based on an examination of a sample of this caviar?

Microscopic examination: Gram-positive cocci present.

Culture: *B. subtilis* present.

M. B. Jarman, M.D., Hot Springs, Va.

ANSWER:—The presence of *B. subtilis* in the suspected food would indicate that it was a possible air-borne contaminant. As far as is known, this organism has not been involved in food poisoning. The most important gram-positive cocci responsible for food poisoning are certain strains of staphylococci which grow well on ordinary mediums. Therefore this laboratory report would be without value in incriminating the caviar as the cause of food poisoning.

BOWING OF LEGS IN INFANCY

To the Editor:—In *The Journal* for March 1, 1941, page 906, the answer given to the question on bowing of the legs in infancy seems to me to be inadequate. By far the majority of cases are caused by congenital variations in the anatomy of the feet which affect weight bearing so as to cause pronation. Specifically, the most common of these faults is congenital shortness of the tendon of the heel. Shortness of the first metatarsal bone resulting in pronation is also a contributing factor in many cases, and in an appreciable number the presence of an accessory scaphoid bone with the accompanying weakness of the foot and severe pronation is a positive factor. Anything which causes pronation in the foot may cause bowing of the legs, since the development of the legs and the growth of the epiphyses are dependent on function in weight bearing, and any condition which results in a shift of the normal weight-bearing line will result in a corresponding deformity of the legs. It is also interesting to note that bowing, torsion of the tibia, and knock knee may all be present at the same time in the same child. Dr. Guy Caldwell has recently shown that overweight is a definite factor in the production of deformities of the legs in children. No treatment is necessary if normal anatomy is present in the feet and if the child is not overweight. If anatomic abnormalities or overweight are present, the shoes should be so altered as to restore normal weight-bearing stress, or the deformity resulting from abnormal weight bearing cannot be expected to correct itself.

SULFADIAZINE

THERAPEUTIC EVALUATION AND TOXIC EFFECTS ON FOUR HUNDRED AND FORTY-SIX PATIENTS

MAXWELL FINLAND, M.D.
ELIAS STRAUSS, M.D.
AND
OSLER L. PETERSON, M.D.
BOSTON

Sulfadiazine (2-sulfanilamidopyrimidine), the pyrimidine analogue of sulfapyridine and sulfathiazole, is one of a group of heterocyclic derivatives of sulfanilamide synthesized by Roblin and his co-workers.¹ Laboratory studies on animals indicated that this drug has less toxicity than sulfapyridine and sulfathiazole and is highly effective against experimental infections with common pathogens.² Preliminary observations in this clinic³ and in a number of others in which sulfadiazine was made available⁴ indicated that this drug was worthy of extensive trial in the therapy of human bacterial infections. This paper deals mainly with a report of the clinical use of sulfadiazine in 446 adult patients treated at the Boston City Hospital prior to March 1, 1941. The results of laboratory studies will be reviewed briefly.

ANIMAL EXPERIMENTS

Feinstone and his associates² have shown that sulfadiazine is considerably less toxic than sulfapyridine or sulfathiazole both in acute experiments on mice and after prolonged administration in monkeys. In these animals and in rabbits absorption of sulfadiazine after oral administration was rapid, there was little acetylation and the levels of the free drug reached were higher and were maintained longer than after similar doses of sulfapyridine or sulfathiazole. Because of these observations, comparisons of efficacy were difficult to evaluate. When identical doses were used in mice,

From the Thorndike Memorial Laboratory, Second and Fourth Medical Services (Harvard), Boston City Hospital, and the Department of Medicine, Harvard Medical School.

This study was carried out with the technical assistance of Mildred W. Barnes and Clare Wilcox, who also assisted in collecting the data. The chemical determinations were made by Elizabeth Shaler Smith and Alice N. Ballou. The visiting and house staffs of the medical services cooperated in this work. The sulfadiazine and specific serums used in this study were supplied by the Lederle Laboratories, Inc.

however, sulfadiazine was found to be considerably more effective than the other drugs in the therapy of experimental infections with pneumococcus, hemolytic streptococcus and Friedländer's bacillus type B and about as effective as sulfathiazole against the staphylococcus. Long⁵ has also found sulfadiazine to be effective in mice against infections with these organisms and, in addition, against *Escherichia coli*, *Clostridium welchii* and *Clostridium septicum* infections.

ABSORPTION, EXCRETION AND DISTRIBUTION IN MAN⁶

In human subjects the maximum blood levels after oral administration of sulfadiazine are uniformly higher and are more sustained than after corresponding doses of the other sulfonamides now in common use. Little of the drug appears in the blood in the conjugated form. Excretion of the drug is somewhat delayed; it is recovered almost entirely in the urine, and about one third of the excreted drug is recovered as the acetylated compound. The appearance of the drug in the cerebrospinal fluid even after intravenous administration of the sodium salt is somewhat delayed, but the drug soon reaches and maintains a level about two thirds of that found in the blood. In other exudates, the concentrations more nearly approximate those of the blood. Neither sulfadiazine nor its sodium salt is absorbed to any significant degree from the rectum.

The drug is distributed in the various organs of the body in about the same manner as is sulfathiazole. In the kidney, however, the concentration of sulfadiazine usually is the same as in the blood. In this respect it resembles sulfanilamide and is in contrast to sulfapyridine and sulfathiazole, which are found in the kidney in considerably higher concentrations than in the blood.⁷ The solubility of the acetyl sulfadiazine in urine is much higher than that of acetyl derivatives of sulfapyridine and sulfathiazole.² The latter condition is of interest in view of the fact that many patients with impaired renal function excrete the free and conjugated sulfadiazine more readily than is usually the case with sulfapyridine or sulfathiazole. This will appear from the data to be presented and was also mentioned by Long.⁵

IN VITRO STUDIES

It is now recognized that body fluids as well as the usual laboratory mediums contain substances which inhibit sulfonamide action. Different mediums vary con-

siderably in the degree to which they inhibit the antibacterial action of any given drug.⁸ Our studies indicate that, in addition, a given medium may inhibit the activity of different drugs to varying degrees. It is usually not possible to determine to what extent variations in the action of different sulfonamides on any given organism are due to differential inhibition by the mediums or to intrinsic differences in the activity of the drugs, or to both these factors. In certain synthetic mediums of known composition, sulfonamide action is frequently enhanced one hundred fold or more over its effectiveness in the common infusion broths.

Previous experiments with pneumococci have indicated that the blood broth medium used in this laboratory could be used for comparative studies with sulfapyridine and sulfathiazole.⁹ In this medium sulfadiazine is much less bacteriostatic than sulfapyridine or sulfa-

what less bacteriostatic than sulfathiazole but considerably more effective than sulfapyridine. In a completely synthetic medium¹² or in a simple medium¹³ sulfadiazine was highly bacteriostatic against stock laboratory strains of Friedländer's bacillus types A and B, Flexner dysentery bacillus, *Salmonella suipestifer*, *Salmonella enteritidis*, *Salmonella paratyphosus* A and B, *Salmonella aertrycke* and *Escherichia coli communis*. In most of the experiments sulfadiazine had about the same effect as sulfathiazole and in the others it was somewhat less effective in the same concentrations. In urine, also, sulfadiazine is as effective against these organisms as sulfathiazole. As with other sulfonamides,¹⁴ the bacteriostatic and bactericidal action of sulfadiazine is inhibited by para-aminobenzoic acid.

CLINICAL RESULTS

The laboratory evidence that sulfadiazine has a wide range of effectiveness, the relatively high concentrations of this drug that are so readily maintained in animals and in human beings and its low toxicity which became apparent from the first clinical trials led us to attempt an evaluation of its therapeutic effect in all cases of bacterial infections in which sulfonamides might prove useful. Sulfadiazine was therefore used as the only sulfonamide drug in five of the medical wards beginning November 1 and in three additional wards beginning January 1. Other sulfonamide drugs were used in these wards only while the supply of sulfadiazine was exhausted and in some patients when it became apparent that the response to sulfadiazine was not adequate. As the study progressed, it became necessary, because of the limited supply of the drug available, to exclude from sulfadiazine therapy patients with mild infections when it was felt that an etiologic bacterial incitant would not be identified. The present report includes 446 consecutive patients in whom treatment with sulfadiazine was begun before March 1. Three hundred and sixteen of these patients were treated for pneumonia. The results of treatment in this group will be analyzed in some detail. The remaining patients were treated for a large variety of infections. The clinical results in this group will be summarized briefly and the toxic effects in both groups will be noted.

RESULTS IN PNEUMONIA

In general, the results of sulfadiazine treatment in pneumonia (tables 1 to 4) compared favorably in every way with those obtained during the previous year with sulfapyridine and sulfathiazole,¹⁵ and the cases were quite comparable as judged by the incidence of various factors which are known to influence the prognosis. Some of the pneumonias occurred as a complication of clinical influenza which occurred in epidemic form during part of this study. In a number of these cases, which will be described in detail elsewhere, the staphylococcus appeared to be the inciting agent in the pulmonary process. Others in which there were pulmonary lesions in which significant pathogens were not obtained on culture are included under the "primary" pneumonias of undetermined etiology.

TABLE 1.—Etiologic Factors and Mortality in Pneumonia Treated with Sulfadiazine

Etiologic Classification	Number of Patients *	Died *	Per Cent Died
A. Pneumococcal pneumonia.....	178 (33)	19 (8)	10.7

thiazole. Similar results with pneumococci were noted by Osgood and Bullowa in cultures taken from bone marrow.¹⁰ In pneumococcal tests carried out in defibrinated human blood with a technic previously described,¹¹ however, sulfadiazine was found to be about as effective as sulfathiazole. In all other mediums tested sulfadiazine was less effective against pneumococci than were sulfathiazole and sulfapyridine except in a liver infusion medium,⁸ which presumably contains the least inhibitor for all three drugs and in which all these drugs were about equally effective. In this medium a pneumococcus made fast to sulfapyridine and sulfathiazole⁹ was also found to be fast to sulfadiazine.

Against *Staphylococcus aureus*, when a simple liver infusion medium was used,⁸ sulfadiazine was some-

Pneumococcic Pneumonias.—There were 19 deaths among the 178 patients with pneumococcic pneumonia treated with sulfadiazine, a mortality of 10.7 per cent. During the previous season¹⁵ there were 112 deaths among 687 patients treated with sulfapyridine or sulfathiazole with or without specific serums, a mortality of 16.3 per cent. Among the sulfadiazine treated patients 33, or 19 per cent, had positive blood cultures before treatment and 8 of these bacteremic patients died (26 per cent). More than one lobe was involved in 62, or 35 per cent, of the 178 patients; 59 per cent were over 40 years of age and 26 per cent were more than 60. The incidence of these important prognostic factors in the present series is similar to that found in the pneumococcic pneumonias during the previous year, but the mortality was slightly lower in each of the corresponding groups of sulfadiazine treated patients.

Specific antipneumococcus serums were given to supplement the chemotherapy to 16 of these patients, of whom 6 died. Ten of the recipients of serum, including 5 who died, had positive blood cultures before therapy was started.

Complications in the patients with pneumococcic pneumonias were relatively few. A sterile pleural effusion was demonstrated in 10 patients, conjunctivitis in 1, suppurative otitis media in 4, empyema in 2 and both empyema and fibrinous pericarditis in 1. The latter patient required rib resection for the empyema, while all the others recovered completely without surgical intervention.

Of the fatalities 8 patients were moribund at the time of admission and only 1 of these lived for more than twenty-four hours after the first dose of sulfadiazine. Only 2 other patients may be said to have died of the pneumococcic infection: One was a woman aged 40 who died of vegetative pneumococcic (type VII) endocarditis and old rheumatic heart disease; the other was an alcoholic patient aged 27 with severe leukopenia (1,400 per cu. mm.) and involvement of the entire right lung who had a persistent type VII pneumococcic bacteremia during four days of sulfadiazine therapy. He was then given serum and died the following day. Autopsy revealed abscess formation in the consolidated lung; the cardiac blood was sterile. The 9 other fatalities were of aged patients who died of various untoward events not directly related to the pneumococcic infection and after the latter had apparently been overcome.

The specific antibody response of a number of the patients who recovered was studied and was found to be similar to that of patients who recovered following sulfapyridine therapy.¹⁶

Other Specific Pneumonias.—The 35 pneumonia patients with pathogenic organisms other than pneumococci were, for the most part, severely ill at the time of admission to the hospital. Most of the cases in which the staphylococcus was predominant occurred as a complication of epidemic influenza. Recovery following chemotherapy in some of these cases was prompt and complete. In others, in spite of continued therapy, there was prolonged illness with clinical and roentgen evidence of abscess formation and localized pleural effusion. All except 1 patient recovered completely before discharge from the hospital.

Six of the deaths occurred among the patients with staphylococcic pneumonias. Three of these were of

patients with the fulminating type of rapidly spreading pneumonia complicating influenza, and death occurred within forty-eight hours of admission to the hospital. Culture of the blood of one of these patients taken before treatment yielded hemolytic streptococci but a culture of the sputum showed a predominance of staphylococci. Death occurred after thirty-six hours. At autopsy there was diffuse hemorrhagic pneumonia with ulcerative bronchitis and multiple abscesses. The contents of the abscesses yielded an abundant growth of staphylococci, but the cardiac blood was sterile. The other three deaths were of patients aged 64, 76 and 81 who died fourteen, sixteen and eight days, respectively, after chemotherapy was started. All were severely ill and showed temporary improvement under therapy. One of these patients died of pulmonary infarcts from thrombophlebitis. One of the others had multiple staphylococcic abscesses in the lung at necropsy.

Fluid was obtained by thoracentesis on 6 of the patients with staphylococcic pneumonia who recovered. The original pleural fluid and subsequent ones of 2 were all sterile. Of the remaining 4, all of whom had pleural exudates which were infected with staphylococci, 2 recovered completely under sulfadiazine therapy and repeated aspirations, while the others underwent surgical drainage by rib resection.

The 4 patients with primary streptococcic pneumonia were all severely ill and 2 had positive blood cultures at the time sulfadiazine treatment was begun. All these patients recovered completely. Two of them, including one with bacteremia, had empyema which cleared up completely with chemotherapy and repeated thoracentesis and did not require surgical intervention.

Two patients with pneumonia of type A Friedländer's bacillus were treated with sulfadiazine. One was a man aged 51 who had a negative blood culture and an atypical pneumonia involving the entire left lung at the time of admission. Chemotherapy was started before the end of the first day and the patient was afebrile and relieved of acute symptoms after sixteen hours. The other patient was a man aged 46 who had been ill six days, had a positive blood culture and a leukocyte count of 2,500 per cubic millimeter at the time sulfadiazine therapy was started. He died twenty-six hours later in spite of intensive therapy, including intravenous sodium sulfadiazine and specific rabbit antiserum.

Non-Pneumococcic Pneumonias.—The mortality in all the 138 cases of pneumonia treated with sulfadiazine in which pneumococci were not obtained (including those in which specific bacteria were involved) was 21 per cent, as compared with 23 per cent in the corresponding group of 95 treated with sulfathiazole during the previous year.¹⁵ In both groups the mortality was higher in the atypical pneumonias (bronchopneumonia) and in those secondary to other serious illness than it was in the lobar pneumonias and in the primary pneumonias, respectively.

Effect of Age on Mortality (table 2).—This was most striking in the pneumococcic pneumonias (group A) and in the pneumonias classified as "primary" in which a definite etiologic agent was not identified (group C). Among the latter there were no deaths among 30 patients under 50 years of age, while less than 3 per cent of the 104 patients with pneumococcic pneumonia in this age group died. Among the specific non-pneumococcic pneumonias (group B) and the "sec-

ondary" pneumonias (group D) the mortality of patients over 50 was about twice as high as that of those under 50 years of age.

Dosage of Sulfadiazine Used in the Pneumonias (table 3).—Most of the patients received an initial dose of 2 or 4 Gm. and then 1 Gm. every four hours

until the drug was discontinued—usually three to five days after the fever had entirely subsided. In some of the wards the dosage was reduced to 1 Gm. every six hours after the patient became afebrile. Some of the patients with the severest attacks received an initial dose of 5 Gm. of sodium sulfadiazine either in 100 cc. or more of saline solution intravenously or in a liter of physiologic solution of sodium chloride subcutaneously (as recommended by Taplin¹⁷). About three fourths of the patients who recovered were treated for six days or less and received less than 40 Gm. of the drug. The average dose among the patients with pneumococcal pneumonias who recovered was 38 Gm. The bacteremic patients received an average of 8 Gm. more than those with negative blood cultures. There was a general tendency, especially in the earlier part of this study, to continue the chemotherapy longer than was indicated. This was definitely attributable to the low toxicity of the drug. It was also noted during the previous year that sulfathiazole treated patients were given the drug an average of one day longer than those who received sulfapyridine. With the latter, nausea and vomiting were more frequent and more severe.

Sulfathiazole was used instead of sulfadiazine during part of the course in 28 cases of pneumonia. In more than half of these cases the sulfathiazole was used for one or two days to maintain treatment after essential recovery had taken place under sulfadiazine, while the supply of the latter was exhausted. Larger amounts were used mainly in the treatment of febrile complications. In 9 cases of pneumococcal pneumonia an average of 23 Gm. of sulfathiazole was used in addition to 31 Gm. of sulfadiazine. Four patients with staphylococcal pneumonias, including the 2 who had a rib resection for empyema, received an average of 75 Gm. of sulfathiazole in addition to 54 Gm. of sulfadiazine.

Duration of Acute Illness (table 4).—Among the 159 patients with pneumococcal pneumonia who recovered following sulfadiazine therapy alone or supplemented

with serum (group A), 75 per cent were essentially afebrile and recovered within thirty-six hours after the first dose of the drug. During the previous season¹⁵ about 68 per cent of the patients with corresponding conditions had a similar response to either sulfapyridine or sulfathiazole. Recovery in a large proportion of the patients with specific non-pneumococcal pneumonias (group B) was delayed owing to the presence of febrile complications, as already noted. In about one third of all the fatal cases death occurred within thirty-six hours after treatment was started. In most of the others there was obvious and sometimes striking improvement following sulfadiazine treatment at first, and death occurred several days later as a result of complicating conditions.

RESULTS IN INFECTIONS OTHER THAN PNEUMONIA

Sulfadiazine was used in the treatment of 130 patients with a variety of infections. The diseases treated are listed in table 5 with the average total amount of drug used and an estimation of the curative effect of the drug in each condition. It is possible here to mention only briefly a few of the salient features concerning each of the groups of cases:

Acute Infections of the Upper Respiratory Tract.—The 40 patients included in this group all appeared acutely ill when chemotherapy was started. Many of them had scattered musical and crepitant rales throughout the lungs and were suspected of having pneumonia, but roentgenograms showed no evidence of pulmonary consolidation. Eighteen of the patients were admitted to the hospital during an epidemic of influenza and had characteristic symptoms of this disease with moderate or severe tracheobronchitis. All these patients recovered rapidly and completely soon after sulfadiazine treatment was started, but it is not possible in most instances to evaluate the role of the drug in the recovery or in the prevention of complications. The 4 patients with sinusitis all had severe symptoms and high fever, and 1 had a positive blood culture for *Staphylococcus aureus* before therapy. All were noticeably improved and essentially afebrile within fifteen to thirty-six hours after the first dose of sulfadiazine. In 1 of the 2 cases of otitis media, hemolytic streptococci and staphylococci

were cultured from the purulent exudate, which cleared completely in two days. In the other the purulent discharge, from which *Staphylococcus aureus* was cultured, continued for several days in spite of full doses of sulfadiazine and finally cleared. In the latter case a course of sulfathiazole therapy had previously been given without benefit.

Erysipelas and Scarlet Fever.—The results of therapy in 8 patients with facial erysipelas were uniformly good.

17. Taplin, G. V.; Jacox, R. F., and Howland, J. W.: The Use of Sodium Sulfapyridine by Hypodermoclysis, J. A. M. A. 114:1733 (May 4) 1940.

Four patients had severe attacks of the disease with extensive involvement, edema, high fever and toxemia. All improved definitely within twelve to thirty-six hours after the first dose of sulfadiazine. The other 4 had milder attacks which cleared promptly under treatment. Cultures of the blood of all were negative. One Negro

A, B, C and D refer to groups of patients listed in table 1.

patient with severe scarlet fever and leukopenia (1,700 per cubic millimeter), who failed to improve after four days of sulfathiazole treatment, continued to have fever for several days after he was changed to sulfadiazine and then recovered completely.

Infections of the Urinary Tract.—There was a striking difference in response between the patients with acute and those with chronic infections of the urinary tract. Among the 17 patients with acute involvement the urinary abnormalities and symptoms cleared completely and cultures became sterile fairly promptly following sulfadiazine treatment. Colon bacillus, alone or with other organisms, was cultured from the urine of most of these patients before treatment, and subsequent urines were sterile. The 12 patients with chronic infections included 3 with Friedländer's bacillus as the predominant organism in the urine (2 of these patients had previously had a nephrectomy), 2 with Flexner dysentery bacilluria and others with a variety of organisms including colon bacilli in cultures of the urine. Only 2 of these 12 patients recovered completely, and both of these had colon bacilli predominantly. Seven others were definitely improved but either had a relapse or continued to have residual symptoms. The patient with Proteus bacillus infection died within thirty-six hours. One other patient died with a complicating diabetic acidosis.

Most of the patients in this group received 6 Gm. daily, but some were given 1 Gm. every six hours during part or all of the course of treatment. Eight of the patients with chronic attacks who failed to show a complete recovery under sulfadiazine had a similar or longer course of sulfathiazole therapy given either before or after the sulfadiazine but with similar lack of success in every instance.

Three of the patients in this group showed abnormal retention of the drug with blood levels above 20 mg. per hundred cubic centimeters (free and acetylated). In none of them was more than one third of the circulating drug found in the conjugated (acetylated) form. One of these 3 patients had a rise in blood nonprotein nitrogen from 54 to 75 mg. per hundred cubic centimeters during the sulfadiazine therapy, but this dropped slowly to 32 mg. per hundred cubic centimeters within a few days. The patient's urine and symptoms, however, improved steadily during chemotherapy.

Gonococcic Arthritis With or Without Urthritis.—The results among patients with these disorders also varied with the chronicity of the disease. Four of the patients had symptoms for less than ten days before sulfadiazine therapy was started, and their disease was classed as acute. All these patients improved rapidly under the treatment. In 1 of them the symptoms recurred one week after discharge from the hospital and shortly after a prostatic massage. Five patients had symptoms for three weeks to several months before admission to the hospital. One of them made a good recovery; the other 4 either failed to improve or improved slowly and then had a relapse of symptoms. Each of these 4 patients also received, either before or after the sulfadiazine, a course of sulfapyridine or sulfathiazole averaging 61 Gm. These drugs likewise failed to bring about a cure.

Meningococcic Infections.—Sulfadiazine was used in the treatment of 2 patients with endemic meningococcic meningitis and 1 with meningococcemia and arthritis (without meningitis). One of the meningitis patients was moribund on admission to the hospital and died within twelve hours. The other 2 patients recovered promptly and completely. During the course of the present study, Dingle and Thomas of this laboratory had an opportunity to treat 11 consecutive cases of epidemic type I meningococcic meningitis in Halifax, N. S. They observed an excellent therapeutic response

to sulfadiazine in every instance. The details in all 14 cases are reported separately.¹⁸

Pneumococcic Meningitis.—The 4 patients with this disease who were treated with sulfadiazine all had massive infection and bacteremia on admission. One of them died four hours after receiving the first dose of the drug. Two others died after two days of treat-

ment with the drug and with intravenous specific serum. In the fourth patient the meningitis occurred as a complication of a fractured skull with extensive brain injury. The blood and spinal fluid were rapidly sterilized following treatment with the drug supplemented with intravenous serum, but the patient died during a

Seven cases are listed twice.

relapse of the infection five weeks later. Three of these patients received one or more doses of sodium sulfadiazine parenterally.

Subacute Bacterial Endocarditis.—The results of therapy with sulfadiazine in 5 cases of this disease were uniformly poor. Negative blood cultures were obtained after treatment in only 1 of these cases. In the others the bacteremia persisted in spite of continued therapy. One of the latter patients is still under treatment and the other 4 have died. The organism was *Streptococcus viridans* in 4 of the cases and *enterococcus* in the fifth. In 4 cases, all the other common sulfonamides were used in rotation before and after sulfadiazine, an average of 400 Gm. of these drugs being used—all without demonstrable benefit.

Chronic Pulmonary Infections.—Only 3 of the 14 patients in this group showed some improvement under sulfadiazine therapy. This was attributed in each instance to the partial relief of a superimposed acute pulmonary infection. An antipyretic effect such as that noted by Beeson and Janeway¹⁹ in patients treated with sulfapyridine was not observed in any of these patients.

Focal Staphylococcic Infections.—In 1 case an infected staphylococci cleared rapidly after the purulent fluid was tapped and sulfadiazine given orally. Culture of the fluid yielded staphylococci as the predominant organisms and also Friedländer's bacilli. In a second case, a staphylococcic pyarthrosis was improved significantly under treatment. Evidences of infection cleared rapidly, but the joint pain persisted.

Intestinal and Peritoneal Infections.—One patient with known peptic ulcer had low grade fever and suggestive evidence of a subacute perforation. This patient was afebrile and symptom free during two courses of sulfadiazine therapy, but the ulcer symptoms recurred each time after the drug was stopped. A second patient with a gastrocolic fistula obtained no relief and subsequently was operated on and died. The third patient

in this group had chronic ulcerative colitis which was not affected by sulfadiazine given orally and in retention enemas. *Salmonella supester* was identified in repeated stool cultures from this patient.

Miscellaneous Diseases.—In this group are included 4 cases of rheumatic fever, 2 of acute leukemia and 1 each of disseminated lupus erythematosus, *S. supester* bacteremia (which proved at autopsy to arise from an infected mural thrombus at the site of an old coronary infarct), acute coronary infarction, catarrhal jaundice, infectious mononucleosis and a case of pyrexia of undetermined origin. Definite improvement was noted in only 2 cases: the patient with infectious mononucleosis was afebrile and free of symptoms on the second day of treatment, and one of the patients with acute leukemia showed a definite temporary improvement when a submaxillary abscess cleared under chemotherapy. There was temporary and partial improvement in one case of acute rheumatic fever. The patient who was treated for fever of undetermined origin was the only one of the 446 patients in whom severe renal symptoms (colic and hematuria) developed. This occurred after two and one-half weeks of continued therapy with full doses.

TOXIC EFFECTS

Toxic symptoms referable to sulfadiazine therapy were comparatively rare and mild. They were noted in 63, or 14.1 per cent, of the 446 patients, excluding those in whom crystals were found in the urine without other abnormalities or symptoms (tables 6 and 7).

Nausea and Vomiting.—During sulfadiazine administration nausea and vomiting were noted in 9.2 per cent of the patients, including those in whom this symptom was present before the drug was started. In no instance was this symptom severe. On the other hand, many patients who had been vomiting prior to the sulfadiazine therapy, either as part of their illness or as a result of therapy with other drugs, tolerated the sulfadiazine well.

In the Urinary Tract.—Crystals, probably acetylsulfadiazine, were noted in the urine during therapy in 35 patients. These were most frequently of the "sheaves of wheat" type and closely resembled the crystals of acetylsulfathiazole.²⁰ There were no other urinary abnormalities except in the 3 patients with hematuria. In 2 of the latter a few red blood cells

TABLE 7.—Comparative Toxicity of Sulfadiazine and Sulfathiazole in Cases in Which Both Drugs Were Given

Number treated with both drugs.....	66

were noted in the urine in the course of therapy, but subsequent specimens of urine taken while the drug was continued were free of blood. In 1 patient ureteral colic and gross hematuria developed followed by anuria on the seventeenth day of therapy. This was promptly relieved by catheterization of the ureters and pelvic lavage. The concentration of sulfadiazine in the blood at the time was 19.8 mg. per hundred cubic centimeters, of which 1.5 mg. was the acetyl derivative. The first urine voided after the catheterization con-

tained 271 mg. per hundred cubic centimeters of sulfadiazine, of which 150 mg. was of the acetyl derivative.

Five patients showed a significant rise in nonprotein nitrogen during sulfadiazine therapy. The concentration of sulfadiazine in the blood of 1 of these patients who was treated for pneumonia rose and reached a level of 44 mg. per hundred cubic centimeters, of which 26 mg. was of the acetyl derivatives. This was the highest percentage of acetylation of sulfadiazine in the blood noted in this study but the patient had no untoward symptoms. There were 16 other patients with elevated levels of nonprotein nitrogen (ranging from 43 to 91 mg. per hundred cubic centimeters of blood) before sulfadiazine therapy was started whose levels dropped 20 to 41 mg. per hundred cubic centimeters during the course of drug therapy.

Leukopenia.—Drops in the leukocyte count from high or normal to below 4,000 per cubic millimeter were noted in 9 cases. There was a proportionate drop in the granulocytes. In 6 of the cases the drop occurred during the first four days and the leukocyte count rose again while the drug therapy was continued. In the other 3 the low counts were noted between the eleventh and the sixteenth day of therapy, and the lowest count was 2,000 per cubic millimeter. In these cases the drug was stopped and the leukocyte count promptly rose.

There were 8 other patients with initial leukocyte counts below 4,000 before treatment whose counts rose during therapy. One of these had severe alcoholic pneumonia, with bacteremia and infected pleural fluid. His leukocyte count before treatment was 500 per cubic millimeter. This rose gradually under sulfadiazine and serum therapy, and the patient made a complete recovery.

Dermatitis and Fever.—Only 1 patient had fever as the only symptom that could be attributed definitely to the drug. A rash was noted on 9 patients. This was morbilliform in each instance, except in 1 patient whose rash was of the "erythema nodosum" type, resembling those often seen in sulfathiazole treated cases. The rash appeared on the fourth day of treatment on 1 patient and after eight to fourteen days of sulfadiazine therapy on the others. In each instance the rash cleared promptly when the drug was stopped. In another patient, readministration of the drug one week later resulted in a recurrence of the rash after twenty-four hours.

Miscellaneous.—Headache and slight dizziness were noted during treatment of 2 patients and were relieved when the drug was stopped. Anemia, either of the acute or of the slowly progressive type, resulting from chemotherapy, was not observed in any of these patients. Jaundice did not develop in any patient under treatment. Three patients with clinical and laboratory evidence of impaired hepatic function were treated with full doses of sulfadiazine. In 2 of these patients the hepatic function improved and in the other it remained unchanged during treatment.

Comparison with Sulfathiazole (table 7).—Each of 66 patients received a separate course of both sulfathiazole and sulfadiazine. This offered an opportunity for the comparison of the toxic effects of the two drugs in the same patients. Some toxic symptoms, mostly nausea, vomiting, hematuria and dermatitis, were noted in 39 patients while they were receiving sulfathiazole, but only 13 had any untoward effects from sulfadiazine. Twenty-eight patients had symptoms from sulfathiazole and not from sulfadiazine, while the reverse was true in only 2 patients.

SUMMARY AND CONCLUSIONS

Sulfadiazine was used in the treatment of 446 patients with various infections. It appeared to be highly effective in the treatment of the following diseases: pneumococcal, staphylococcal and streptococcal pneumonias; meningococcal infections; acute infections of the upper respiratory tract including sinusitis; erysipelas; acute infections of the urinary tract, particularly those associated with *Escherichia coli* bacilluria, and acute gonorrheal arthritis.

No well defined beneficial effects were noted from its use in the treatment of chronic infections of the urinary tract, chronic gonococcal arthritis, subacute bacterial endocarditis or chronic pulmonary infections. However, in all patients with these conditions in whom sulfadiazine therapy was not effective and in whom other sulfonamides were tried, the latter were likewise ineffective.

The results in the cases of pneumococcal pneumonia treated with sulfadiazine are comparable in every respect with the best results obtained in this clinic with the use of either sulfapyridine or sulfathiazole. In all the other conditions the numbers of cases are too few to warrant definite conclusions or comparisons. In general, sulfadiazine appeared to be as effective as sulfapyridine or sulfathiazole in every condition in which it was used.

Toxic effects from sulfadiazine were relatively mild and infrequent. Nausea and vomiting occurred in 9.2 per cent of the cases. Nitrogen retention of moderate degree was noted in 5 cases. Leukopenia occurred early and was transient in some cases. In 3 cases the leukocyte counts dropped between the eleventh and the sixteenth day and returned to normal on cessation of therapy. Morbilliform eruptions were observed in 9 cases and usually appeared on the eighth day or later. In 1 case renal colic, hematuria and anuria were relieved by ureteral catheterization.

A number of patients with definite evidence of renal or hepatic damage were treated with sulfadiazine without further impairment and, in some instances, with actual improvement of function in the course of therapy. Some patients with initial leukopenia showed a rise in the white blood count during sulfadiazine therapy.

Sixty-six patients received both sulfathiazole and sulfadiazine, and toxic effects from sulfathiazole were three times as frequent as they were during sulfadiazine therapy.

Sodium sulfadiazine in physiologic solution of sodium chloride was used for the initial dose in some of the most severe cases. No untoward local or systemic effects were noted from its administration in concentrations of 1 to 5 per cent of the drug intravenously or 0.5 per cent subcutaneously.

The Discoveries of Claude Bernard.—Claude Bernard (1813-1878), the great physiologist, made at least three important discoveries: (1) the digestive action of the pancreatic juice; (2) the glycogenic function of the liver; and (3) the discovery of the vasomotor nerves, which is his outstanding contribution to psychiatry. Since the vasomotor fibers are distributed through all tissues of the organism and are involved in reflex control, researches on the action of various chemical substances, peripheral resistance, blood pressure phenomena, reflex equilibrium, organic animal life and environment and the effect of emotions upon the organism, as well as many other types of investigation, have been made possible.—Lewis, Nolan D. C.: *A Short History of Psychiatric Achievement*, New York, W. W. Norton & Co., Inc., 1941.

AN ACUTE MEDIASTINOCARDIAC REACTION FOLLOWING IRRADIATION IN HYPERTHYROIDISM

REPORT OF THREE CASES

EDWARD ROSE, M.D.

AND

CHARLES C. WOLFERTH, M.D.

PHILADELPHIA

Within the past three years we have encountered 3 patients with thyrotoxicosis in whom a clinical picture strongly suggesting an acute noninfectious mediastinocardiac reaction appeared during or shortly after irradiation of the thyroid gland and upper mediastinum. The clinical picture was characterized by acute severe precordial and retrosternal pain aggravated by thoracic movement, electrocardiographic changes of the type associated with acute pericarditis, fever, the absence of significant physical signs and of preceding infection and uncomplicated recovery within a few days. In view of the striking character of this reaction and because of our inability to find a description of a similar clinical picture in the literature, a report of our cases seems desirable.

Fig. 1 (case 1).—A, tracing made July 6, 1937 shows deflection of the RS-T segment, most noticeable in lead 2, and deformity of the T wave. B, tracing made May 15, 1939 is entirely normal except for occasional auricular extrasystoles (not shown here) and left axis deviation. In both A and B lead 4 was made with the electrode of the right arm over the apex and paired with the left leg.

REPORT OF CASES

CASE 1.—Mrs. E. W., aged 33, began to notice fatigue, nervousness and loss of weight soon after the removal of tonsillar remnants in June 1936. When she was first seen on June 25, 1937 there had been a loss of 25 pounds (11 Kg.). Examination revealed slight prominence of the eyes with conjunctival injection, tachycardia, tremor, a widened pulse pressure and a moderate, diffuse, somewhat firm enlargement of the thyroid gland. Her blood pressure was 140 systolic and 50 diastolic, the cardiac rhythm was normal and there was a soft blowing apical systolic murmur. She had had two operations to remove the tonsils in an effort to relieve deafness, but there was no past history of acute tonsillitis, quinsy, chorea or rheumatic fever. The basal metabolic rate was +47 per cent. A diagnosis of toxic diffuse goiter was made and irradiation was begun June 29.

Irradiation was given to the thyroid gland on June 29 and 30 and July 1 and 2. This included 204 roentgens delivered anteriorly to the neck through a rectangular portal 10 by 16 cm., the lower portion of which included the upper mediastinum. Four hundred and ten roentgens was delivered posteriorly through a rectangular portal 10 by 16 cm. No iodine was given at any time.

On July 2 the patient felt a little chilly, and about midnight she was awakened by a severe retrosternal pain which

penetrated through the middle of her chest to the interscapular area. This pain was aggravated by deep breathing, and she was unable to lie down but felt as though she had to sit erect and keep her thorax immobile. There was no radiation of the pain to either shoulder or to the arms. The symptoms continued with increasing severity until she was seen about 1:30 p. m. July 3. At this time her temperature was 100 F., the pulse rate 88 with normal rhythm and the blood pressure 115 systolic and 70 diastolic. Respiration was shallow, uneasy and accompanied by slight grunting. Examination of the heart revealed only slight tachycardia and the apical systolic murmur previously noted; examination of the lungs showed only diminished aeration throughout. Nothing suggestive of pericardial or pleural friction could be heard. The patient was given $\frac{1}{4}$ grain (0.016 Gm.) of morphine sulfate and was immediately transferred to the hospital.

The leukocyte count on admission showed 14,800 cells per cubic millimeter, with 91 per cent neutrophils, 5 per cent lymphocytes and 4 per cent monocytes. Her temperature was 101.1 F. on admission. The following day the pain was much better. The temperature had returned to normal and the leukocyte count had dropped to 5,150 per cubic millimeter. There were still no abnormal pulmonary signs, but auricular fibrillation was present with a rapid ventricular rate. Administration of quinidine sulfate was begun, 0.2 Gm. every four hours. On July 5 the cardiac rhythm had reverted to normal, and the patient's symptoms had practically disappeared except for slight retrosternal pain on yawning. The administration of quinidine sulfate was stopped.

An electrocardiogram on July 6 showed changes of the sort sometimes found in acute pericarditis with T waves of low amplitude and deflection of the RS-T segment (fig. 1A). The patient's symptoms had entirely disappeared by this date. On July 8 she received a final dose of radiation consisting of 205 roentgens delivered anteriorly through the same portal previously employed. Unfortunately at this time the relationship between the irradiation and the patient's acute thoracic symptoms was not appreciated. This fact, together with her economic limitations, explains why more complete and detailed studies were not made at the time. The thyrotoxicosis continued to improve steadily with a progressive gain in weight and subsidence of the goiter. No more irradiation was given. On October 12, the basal metabolic rate was -9 per cent and on Feb. 3, 1940 it was +3 per cent. An electrocardiogram made May 15, 1939 showed occasional auricular extrasystoles and left axis deviation but was otherwise normal (fig. 1B). Periodic physical examination of the heart since that date has revealed nothing of significance, and the patient is now entirely well except for chronic deafness and nasal allergy.

CASE 2.—Mrs. L. W., aged 30, was seen in consultation with Dr. I. S. Ravdin, who has given us permission to report her case.

In October 1937 signs and symptoms of thyrotoxicosis first appeared, the basal metabolic rate at that time being +45 per cent. After prolonged rest and sedation, there was gradual improvement, and in March 1938 the basal metabolic rate was +7 per cent. On November 29 the basal metabolic rate was +18 per cent. In January 1939 thyrotoxic symptoms again became manifest, and irradiation of the thyroid gland was begun February 1. This therapy was repeated on February 2, 3, 27 and 28 and on March 1, 2, 28, 29 and 30. A total of 919 roentgens was given through each of two skin portals 10 by 15 cm. over the right and left anterior portion of the neck, and a total of 744 roentgens was given through each of two skin portals of the same dimensions over the right and left portions of the neck posteriorly. The total dose of radiation received, therefore, was 3,326 roentgens. During the last series of treatments on March 28, 29 and 30, the total dose received anteriorly was 526 roentgens and the total posterior dose was also 526 roentgens. On March 13 the basal metabolic rate was +36 per cent.

Early in March the patient became pregnant, and during the next few weeks her symptoms were considerably aggravated. She received no iodine but was given sedatives and kept at rest much of the time. On April 2, while at rest in bed, the patient was suddenly seized by a sharp precordial pain which radiated

toward the lower left axilla and through the middle and upper retrosternal regions. This pain was made worse by respiration or other movement of the thorax and continued with little respite until her admission to the hospital on April 3.

At the time of admission, her temperature was 100 F., blood pressure 120 systolic and 60 diastolic, pulse rate 120 and respiratory rate 24. The leukocytes numbered 9,300 per cubic millimeter with 86 per cent neutrophils. The patient was nervous and apprehensive, and respiration was apparently painful. There was slight exophthalmos and a diffuse, moderate, soft enlargement of the thyroid. The lungs were essentially normal on examination, and the heart showed only tachycardia with a normal rhythm; no pleural or pericardial friction rub could be heard. An electrocardiogram made soon after admission showed a pattern suggesting acute pericarditis with elevation of the RS-T segment in leads 1 and 2 (fig. 2 *A*). The following day, the pain had decreased considerably and the fever had subsided. One examiner thought that a definite friction rub was audible in the lower left part of the left axilla. An electrocardiogram made on this date showed auricular extrasystoles and deformities of the T wave in various leads (fig. 2 *B*). The deflection of the RS-T segment was less noticeable than in the first tracing. Roentgen examination of the chest on April 5 gave negative results. The pain had practically disappeared by this time and did not recur. Electrocardiograms made April 10 and 18 showed a progressive return toward normal (fig. 2 *C* and *D*). The basal metabolic rate on April 19 was +23 per cent.

The patient left the hospital April 21 with no cardiac or pulmonary signs or symptoms although still presenting a picture of moderate thyrotoxicosis. Further irradiation to the thyroid gland was given in May and June 1939 without any untoward reaction. An electrocardiogram made May 17 showed simple tachycardia but was otherwise normal (fig. 2 *E*). The patient remained moderately thyrotoxic throughout the summer and was kept at rest a large part of the time. An electrocardiogram made October 7 showed simple tachycardia but was otherwise normal. By November the thyrotoxicosis had greatly abated and the patient was uneventfully delivered of a normal child December 11. Except for occasional nervousness she has remained well since.

CASE 3.—M. N., a man aged 46, had had pleurisy with effusion at the age of 16. His symptoms disappeared after thoracentesis. A few years later he was told that he had a "spot" in his lungs and was sent away to rest for several months. No roentgenograms were taken at that time. He remained well thereafter until 1927, at which time he had thyrotoxicosis, and a thyroidectomy was done in Richmond, Va. In 1930 his thyrotoxic symptoms recurred, and a second thyroidectomy was performed in New York. In 1932 thyrotoxic symptoms again recurred, and he began the use of iodine, which was continued intermittently until April 1940. In 1934 he received a short course of irradiation to the thyroid region with temporary amelioration of his symptoms. On March 19, 1940, he suffered a short attack of grip with fever, generalized aching and malaise. Gradual recurrent enlargement of the thyroid gland had been noted for some months together with recurrent thyrotoxic symptoms. Accordingly, irradiation of the thyroid gland was again begun in the private office of a Philadelphia roentgenologist. Treatment was given on March 23, 27, 29 and 30 and April 1 and 3. Treatment was given through a lateral portal on each side of the neck and a median portal which included the upper sternal region. The dose received through each portal was 198 roentgens. It should be noted that the patient was taking 10 drops of tincture of iodine regularly each day from March 19 to April 9. A mild diarrhea began about April 5.

On April 6, while stoking his furnace, the patient suddenly felt dizzy and fainted. On recovery he noted a sharp precordial pain which lasted for several minutes but did not radiate. It seemed to be aggravated by respiration or any other movement

of the thorax. This sharp pain continued to recur at irregular intervals but with somewhat decreasing frequency and was accompanied by a duller, more constant, nonradiating retrosternal pain which likewise was made worse by movement of the thorax. The patient was attended by his family physician and on April 9 was admitted to the medical service of Dr. O. H. P. Pepper at the Hospital of the University of Pennsylvania.

It seems certain that the patient received digitalis, but the amount and duration of such therapy is not clear. He stated that he received a large amount of digitalis during the day after the onset of symptoms, but according to another statement he had been taking 4 drops of tincture of digitalis daily for about a month prior to his admission to the hospital.

On admission, he appeared acutely and severely ill. The temperature was 101 F., the radial pulse rate 88, the respiratory rate 22 and the blood pressure 130 systolic and 70 diastolic. There was moderate exophthalmos and a diffuse, noticeable firm enlargement of the thyroid gland, the left lobe being decidedly tender. There was slight cyanosis of the nail beds and advanced erythema of the neck and the upper part of the chest. The pharynx and tonsils were acutely congested. Respiration obviously caused discomfort, and the patient attempted to keep his thorax immobile. Examination of the lungs was negative except for a few crackling rales at the bases of both. The cardiac rhythm was totally irregular (auricular fibrillation). The ventricular rate was rapid, and a systolic murmur was audible at the apex and at the base. In addition, an adventitious sound

Fig. 2 (case 2).—*A*, tracing made April 3, 1939 shows deflection of the RS-T segment most noticeable in lead 2. *B*, tracing made April 4 shows an occasional auricular extrasystole (first beat in lead 2), less deflection of the RS-T segment and beginning deformity of the T wave. *C*, made April 10, and *D*, made April 18, still show some deformity of the T wave. *E*, which was made May 17, is entirely normal except for tachycardia. Subsequent tracings were also normal.

was heard over the base of the heart which was variously interpreted by different examiners. It was harsh and loud during systole, but there was a difference of opinion regarding its diastolic audibility. (The majority of observers felt that this was not a true pericardial friction rub, and this belief was supported later by the fact that the sound persisted long after the patient's pain and other acute symptoms had subsided. It probably represented a type of adventitious sound frequently heard over the cardiac base in persons with thyrotoxicosis, the mechanism of the production of which is not yet clear.)

The hemoglobin content was 69 per cent and the leukocytes numbered 8,500 per cubic millimeter, with neutrophils 65 per cent, lymphocytes 20 per cent, monocytes 7 per cent and eosinophils 8 per cent. Subsequent blood cell counts taken at short intervals during the patient's stay in the hospital showed moderate anemia with leukocyte counts ranging from 4,800 to 6,900 per cubic millimeter. Except for the 8 per cent eosinophils found on admission, the eosinophilic percentage of his leukocytes did not exceed 4.

An electrocardiogram was made on the day of admission (fig. 3 *A*). This showed auricular fibrillation, ventricular extrasystoles, slight prolongation of the QRS complex and diphasic T waves in lead 1. A tracing made April 18, after no digitalis had been taken for nine days, showed a normal rhythm, a PR interval of 0.2 second and disappearance of the intraventricular conduction defect which had been present in the previous tracing

(fig. 3 B). The T waves were practically flat in lead 1 and somewhat deformed in the chest leads. However, a comparison of the T waves with those of the first tracing could not be made because of the digitalis and because the defect in intraventricular conduction may also have influenced the T waves in the first tracing. A tracing made April 27 showed a PR interval of 0.16 second. At this time there was slight inversion of the T waves in leads 1 and 2 and in the chest leads CF_4 and CF_5 (fig. 3 C). The shortening of the PR interval suggested that there may still have been some effects of digitalis on April 9, when the PR interval was 0.2 second. A tracing made May 8 showed flattening of the T waves in lead 1 and lead 2 and small diphasic T waves in the chest leads CF_4 and CF_5 , indicating a change toward normal (fig. 3 D). A tracing made June 1 was entirely within normal limits. The tracings obtained from April 18 until June 1 show a series of changes entirely consistent with a diagnosis of pericarditis rather than myocardial infarction. This view is based on (1) the absence of any of the types of change in the QRS complexes to be expected in myocardial infarction, (2) the pattern of inversion of the T wave and (3) the rapidity of reversion to normal. Digitalis can be ruled out as a cause of these changes even though a large dosage of the drug may have been taken prior to April 9. The period seemed entirely too long for the changes to be accounted for solely by digitalis.

Fig. 3 (case 3).—A, tracing made April 9, 1940 shows auricular fibrillation, a slight defect in intraventricular conduction (present in most beats) and deformity of the T wave in the beats of lead 1 which show the defect in intraventricular conduction. Ventricular extrasystoles were also present but are not shown here. B, tracing made April 18 shows a top normal PR interval (0.2 second) and deformity of the T wave. C, tracing made April 27 shows a PR interval of 0.16 second but greater deformity of the T wave. D, tracing made May 8 shows lessening of the deformity. E, tracing made June 1 is within normal limits and is similar to one made three months later.

On April 11, the attacks of precordial pain were much less frequent and the interval pain had almost disappeared. A maculopapular eruption was noted on the wrists and forearms, and during the next few days this extended to the legs and the upper part of the chest, becoming partly vesicular and later hemorrhagic. Multiple arthralgia first appeared on April 11 and continued to be annoying for about five days. On April 12 the patient complained of stiffness of the neck with pain on motion of the head or neck. Rather profuse epistaxis also occurred that day. The following day diffuse tracheobronchitis was noted, but for the first time the cardiac rhythm was observed to have reverted to normal and remained normal thereafter. The patient's temperature was still elevated but had shown a downward trend since admission. A mild, irregular fever persisted until April 28, after which there was only an occasional isolated slight rise in temperature. On April 14, because of continued stiffness of the neck as well as some mental confusion and the presence of a positive Kernig reflex, a lumbar puncture was performed. The spinal fluid showed pellicle formation and a slight increase in protein content. During the next few days, the mental confusion and the signs of meningeal irritation disappeared rapidly, and a lumbar puncture performed April 22 revealed normal spinal fluid. On April 22 the basal metabolic rate was +25 per cent, and on May 3 it was +35 per cent.

At this time the patient was definitely improved although still obviously thyrotoxic.

Despite the probability that iodism had accounted for at least part of his original clinical picture, it was felt that the resumption of small doses of iodine was justifiable in an attempt to prepare him for subtotal thyroidectomy, especially in view of the fact that he had received no iodine since his admission to the hospital. Accordingly, he was given 3 minims (0.18 cc.) daily of a saturated solution of potassium iodide on May 3, and on May 9 a maximal subtotal thyroidectomy was performed by Dr. E. L. Eliason. Postoperative convalescence was uneventful, and the patient was discharged May 19. He was last seen June 1, at which time he was entirely symptom free. Cardiac examination on this date showed normal rhythm and a faint apical systolic murmur. The adventitious sound previously heard over the cardiac base was not audible.

Case 3 has been reported in some detail because of its complexity and the bizarre clinical picture, which caused a number of diagnoses to be considered when the patient was first seen. Eventually it seemed clear that the whole picture could best be explained by the occurrence of acute iodism in a patient with thyrotoxicosis, complicated by an acute mediastinocardiac reaction

following closely on irradiation of the thyroid region and the upper mediastinum. The occurrence of iodism in thyrotoxic persons has recently been well described by Barker and Wood.¹ All of our patients phenomena are included among the observations on their cases with the exception of the thoracic pain, the electrocardiographic records and the meningeal signs.

In considering the diagnosis of iodism in case 3 the fact must be recalled that the patient had taken iodine intermittently since 1932 with impunity. Three, and probably 4, of Barker and Wood's patients¹ likewise had previously taken iodine without a reaction. Dr. O. H. P. Pepper suggested that the systemic manifestations of iodism might have followed the liberation of iodine from the thyroid and mediastinal tissues as a result of their exposure to radiation and that the presence of iodine in these structures

might in some way have facilitated the acute mediastinocardiac reaction which followed irradiation. Such a hypothesis, however, is not susceptible of proof at this time. Our patient did not remember whether he had been taking iodine during his course of irradiation in 1934.

COMMENT

The principal clinical features of all 3 cases are strikingly similar except for the complicating factors in case 3, which were probably the result of iodism. The retrosternal and midthoracic reference of pain, as well as its striking aggravation by thoracic movement in all 3 cases, strongly suggests some type of inflammatory process involving the mediastinal pleura or the areolar tissue and the other contents of the mediastinum. The absence of any true friction rub (except the transitory rub noted in case 2 in the lower part of the left axilla by one observer) and the absence of any definite indications in the roentgenograms of the chest taken in

1. Barker, W. H., and Wood, W. B., Jr.: Severe Febrile Iodism During Treatment of Hyperthyroidism, *J. A. M. A.* 114: 1029 (March 23) 1940.

cases 2 and 3 by no means exclude such an inflammatory process. It is noteworthy that in no case was there any history of rheumatic infection or of any other acute infectious process immediately preceding the onset of symptoms, except the grip, which preceded by eighteen days the onset of symptoms in case 3. In view of this fact, as well as the brief duration of symptoms and the complete absence of any permanent sequelae in all the cases, an infectious cause of the reaction seems highly unlikely. Likewise, so far as we are aware, acute spontaneous reactions of this type occurring in the course of hyperthyroidism have never been reported. The possibility of some other acute cardiac episode producing similar symptoms (for example, myocardial infarction) seems to be excluded by the electrocardiographic record.

It is difficult to determine the exact nature of the cardiac disturbance which produced the electrocardiographic changes in our cases. The pericardium itself was not exposed to irradiation. It would not be difficult to assume that an inflammatory process due to infection might extend directly from the mediastinal contents or pleurae to the pericardium and to the underlying myocardium (which must be responsible for the electrocardiographic changes in acute pericarditis), but such an assumption is not so easy in the absence of infection. Electrocardiographic changes do occur in uncomplicated hyperthyroidism,² but the abnormalities reported here were not of this type. Furthermore, in case 2 they disappeared long before the thyrotoxicosis, and in case 3 there had been definite change toward a normal pattern prior to operative relief of the hyperthyroidism. It is conceivable, but unlikely, that temporary myocardial change resulting from the absorption of toxic inflammatory products in the mediastinum may have produced the electrocardiographic changes. The pattern, however, is most suggestive of acute pericarditis with underlying myocardial involvement, and the absence of definite pericardial friction rub or effusion does not by any means exclude this possibility.

The occurrence of undoubted acute infectious mediastinitis with transitory electrocardiographic changes of the type associated with . . . by the following episode:

A physician aged 40 had acute severe retrosternal pain extending down both arms and accompanied by fever five days after a fish bone penetrated the pharyngeal wall. An electrocardiogram made about twelve hours after the onset showed deflections of the RS-T segment suggesting an acute pericarditis. Physical examination of the heart and lungs gave negative results. The thoracic pain completely disappeared within a few hours after incision and drainage of a retropharyngeal abscess, and the electrocardiographic pattern reverted toward normal during the next four days.

There could be little doubt that acute mediastinitis with extension to at least outer layers of the myocardium had followed the retropharyngeal infection.

Acute and chronic inflammatory reactions following irradiation in various organs have been extensively studied.³ Changes occurring in the bronchi, lungs

and pleura have been particularly well described by Desjardins⁴ and more recently by Warren and Spencer.⁵ Pericardial and myocardial reactions following direct exposure of these structures to large doses of radiation have been observed in experimental animals by Warthin and Pohle⁶ and by Hartman.⁷ Desjardins⁴ reported extensive structural changes in the human myocardium and pericardium following irradiation of the breast, thorax and lungs. Acute tracheobronchitis, pharyngo-esophagitis and acute or subacute pneumonitis are well recognized reactions to radiation in therapeutic dosage. It seems entirely reasonable, therefore, that an acute sterile inflammatory reaction of the mediastinal pleurae or the mediastinal contents might have followed irradiation in our cases. The possibility must be considered that the retrosternal pain, the fever and the electrocardiographic changes were due merely to simple acute pericarditis which occurred by chance just at the time of irradiation. If the sequence of events had occurred in only 1 case, this possibility could not be excluded. However, the time relations of the events in 3 cases, 2 of which came under our observation within a single year, would appear to make such an assumption improbable.

The only report in the literature which we have been able to find of a reaction resembling that in our cases is of a patient described by Strasser⁸ in 1912 in whom acute anginoid pain accompanied by fever and a pleural friction rub occurred during intensive irradiation of a mediastinal tumor. No electrocardiogram was mentioned in the report.

It is of interest that in both the clinical and the experimental reports inflammatory reactions in nearly all instances were preceded by much larger doses of radiation than our patients received. Thus of 16 patients cited by Warren and Spencer⁵ with definite pulmonary reactions (immediate and late) to irradiation only 1 patient had less than 1,000 roentgens and only 3 had less than 3,000. By contrast, the acute reaction in our case 1 developed after only 204 roentgens had been given anteriorly and 410 posteriorly. In case 2, 1,312 roentgens anteriorly and 962 posteriorly had been given with apparent impunity prior to the series immediately preceding the acute reaction, and in case 3 an unknown amount of radiation had been given about six years previously without untoward effect. Warren and Spencer⁵ stated: "The amount of radiation necessary to produce histologic reaction varies greatly, although in most instances heavy dosage is required. This, together with variations in time and rate at which treatment is given, and the size of portal, suggests that there are factors other than irradiation alone concerned . . ."

SUMMARY

The acute reaction occurring in 3 patients with thyrotoxicosis during or shortly after irradiation of the thyroid area and upper mediastinum was similar in all three cases. Its principal features included the acute onset of precordial and retrosternal pain aggravated by thoracic movement and accompanied by fever, leukocytosis (in 2 cases), transitory auricular fibrillation

ADVANTAGES OF PROTAMINE ZINC INSULIN

RESULTS IN DIABETES COMPLICATED BY
TUBERCULOSIS

HERMAN O. MOSENTHAL, M.D.

AND

MORTON F. MARK, M.D.

NEW YORK

When diabetes and tuberculosis coexist, the tuberculosis nearly always follows on the diabetes, thus making it evident that diabetes predisposes to tuberculosis.¹ The onset of tuberculosis in persons with diabetes is hastened and favored if the diabetes is not properly managed, and it is believed that persons with controlled diabetes are no more liable to have pulmonary tuberculosis than nondiabetic subjects.

The successful treatment of tuberculosis in the diabetic patient is impossible without regulation of the diabetes. We have witnessed the doom of many persons with tuberculosis and diabetes, especially in preinsulin days, when they entered sanatoriums that specialized in the treatment of tuberculosis but scoffed at the necessity for any attention to the diabetes. The satisfactory adjustment of the diabetes makes it possible to achieve the same results with the tuberculosis in the diabetic as in the nondiabetic patient.¹ Since the utmost results for the cure of pulmonary tuberculosis appear to be achieved when the diabetes is well controlled, it seemed worth while to check on the comparative effects of protamine zinc insulin and regular insulin on the clinical course of tuberculosis when it was complicated by diabetes.

The term control of diabetes is usually employed as though it had a set meaning and that its criteria were fixed. The generally accepted conception of what makes the ideal regulation of diabetes is based largely on the existing ingrained deference to normality, that is, averages in persons who are regarded as healthy. The pattern for control of diabetes that has been conventionally set up until recently has been absence of sugar in the urine, freedom from acidosis, a normal level of blood sugar and a moderate degree of underweight.

From the Department of Metabolism of the Sea View Hospital.

The perfect standard of control for diabetes is necessarily in a state of flux depending on the facts that are brought to light from time to time by laboratory research on carbohydrate metabolism and by clinical observation of patients with diabetes.

The first tradition to be set aside was the acknowledgment that an elevation of blood sugar in the absence of glycosuria is not only harmless but even beneficial, because hyperglycemia promotes the utilization of sugar, does not predispose to infections, does not cause degenerative changes in the tissues and in fact is the rule in elderly (nondiabetic) human beings.² The confessed necessity for obtaining a twenty-four hour blood sugar curve to be certain that dextrose persists in the blood within a normal range makes it obvious that any physician who claims that the blood sugar is maintained within conventional accord because the blood sugar in a fasting patient is at a satisfactory level is fooling not only himself but all his patients and co-workers.

Numerous clinical observations have been made that small amounts of sugar in the urine while a patient is under the influence of protamine zinc insulin does no harm. This is a direct contradiction of what was believed to hold true when regular insulin was the only insulin available. Wilder³ has offered an explanation of this paradox by demonstrating that in cases of severe diabetes intermittent periods of destruction of protein and loss of nitrogen occur when regular insulin is injected at the customary intervals throughout the day, whereas tissue loss ceases with the employment of protamine zinc insulin, which is effective for more than twenty-four hours and thus results in constant abatement of some, at least, of the inroads entailed by the uncurbed metabolic disturbance of diabetes. Tolstoi⁴ has advanced further along these lines by showing that even great degrees of glycosuria are not accompanied by loss of nitrogen and, for a period of one year at least, diabetic patients under the influence of protamine zinc insulin have not been adversely affected in any way by such losses of sugar in the urine.

Whether or not glycosuria, of slight or of great degree, is innocuous when persisting over a period of years is something we cannot be certain about for some time to come. Most physicians feel more satisfied with the results of treatment and more secure about the condition of their patients when the urine contains little or no sugar. On the other hand, if hypoglycemic reactions, which often entail considerable temporary and at times permanent impairments, can be avoided by the feeding of extra amounts of carbohydrates, especially at night and before exercise, the risks of glycosuria are decidedly less than the hazards of hypoglycemia.

It is the general impression (one can go no further than that), which we share, that ketonuria, diabetic coma and gangrene and infection of the lower extremities occur less frequently since protamine zinc insulin has become generally used.

Finally, protamine zinc insulin minimizes nervous tension for the patient, since it is administered only once a day, and not a single meal need be taken on schedule time or hurried within a given number of minutes after an injection, which often has to be taken under improvised, more or less exposed and trying conditions when therapy with regular insulin is used.

For all these reasons it was thought pertinent that a study of the comparative results obtained with protamine zinc insulin and with regular insulin in the treatment of diabetes complicated by tuberculosis should be undertaken.

The present study was carried out on 349 patients with diabetes complicated by tuberculosis treated at the Sea View Hospital from 1934 to 1939 inclusive. The diabetes of 71 patients was successfully controlled by diet alone, leaving 278 cases in which the effect of protamine zinc insulin and of regular insulin could be compared. Regular insulin was used exclusively in 131 and protamine zinc insulin alone or combined with regular insulin in 147 cases. Since the introduction of protamine zinc insulin in 1936, nearly all patients have been treated with this insulin.

The status of the tuberculosis on discharge from the hospital was determined for the patients given protamine zinc insulin and compared with that of those given regular insulin. Data on all patients receiving insulin are included in table 1. The figures indicate that protamine zinc insulin has a more favorable influence on the clinical course of tuberculosis than has regular insulin. Of the 147 patients receiving protamine zinc insulin the tuberculosis became arrested or apparently arrested in 22.4 per cent, showed improvement in 6.1 per cent, remained stationary in 22.5 per cent, progressed in 30.6 per cent and resulted in death in 18.4 per cent, while in the 131 treated with regular insulin the tuberculosis was arrested or apparently arrested in 13 per cent, remained stationary in 9.1 per cent and progressed in 33.6 per cent, and 44.3 per cent of the patients died.

A number of patients died or left the hospital within a few months after admission, making the period of observation somewhat brief for an evaluation of the

TABLE 1.—Comparison of Clinical Course of Tuberculosis in Persons with Diabetes Treated with Protamine Zinc Insulin or with Regular Insulin, Including all Cases Regardless of the Duration of Insulin Therapy

Progressive cases.....	41	33.6	45	30.6
Deaths.....	58	44.3	27	18.4

effect on tuberculosis of either type of insulin. Such cases are omitted from table 2, and only those in which protamine zinc insulin or regular insulin has been received for more than six months are included. The data here again show that protamine zinc insulin has a distinctly more favorable influence on the course of the tuberculosis than does regular insulin. The tuberculosis became arrested or apparently arrested in 32.5 per cent of the patients treated with protamine zinc

insulin compared to 21.9 per cent of the patients given regular insulin; progression of the disease or a fatal termination occurred in 28.9 per cent of the group given protamine zinc insulin, while 73.4 per cent of those given regular insulin showed an unfavorable clinical course.

The conclusion that protamine zinc insulin was more efficacious than regular insulin might be questioned on several points. Among these are the degree of tuber-

TABLE 2.—Comparison of Clinical Course of Tuberculosis When Treatment with Protamine Zinc or Regular Insulin Was of More Than Six Months' Duration

Status of Tuberculosis at End of Hospital Stay	Regular Insulin		Protamine Zinc Insulin	
	Number	Per Cent	Number	Per Cent

culosis on admission, the type of therapy accorded the pulmonary disease and the selection of patients in the two groups. No special choice of patients was made for the administration of protamine zinc insulin or of regular insulin. Since the latter part of 1936 nearly all patients requiring insulin were given protamine zinc insulin, whereas previous to that time regular insulin was in routine use; hence the factor of insulin grouping of the patients is eliminated. The grade of the tuberculosis on admission would affect the clinical course; however the stage of the tuberculous process on admission was essentially the same for the two groups. Of the patients receiving protamine zinc insulin for more than six months, 7.3 per cent had a minimal lesion on admission and 39.7 per cent moderately advanced disease, and 53 per cent far advanced disease, while in the group given regular insulin 10.9 per cent had minimal, 34.4 per cent moderately advanced and 54.7 per cent far advanced tuberculosis when they entered the hospital. Variation in the type of treatment for tuberculosis might account for the better results with protamine zinc insulin, but at Sea View Hospital the form of treatment had not appreciably changed since 1934. In support of this is the fact that surgical measures had been used in 56 per cent of the group given protamine zinc insulin and in 53 per cent of those given regular insulin, though the latter were largely those in the hospital prior to 1937 and the patients given protamine zinc insulin after that time.

SUMMARY

Since protamine zinc insulin exerts a more effective control of diabetes mellitus than regular or unmodified insulin, it was thought possible that in cases of diabetes complicated by tuberculosis the tuberculosis might be favorably influenced by protamine zinc insulin compared to unmodified or regular insulin. The records of Sea View Hospital reveal that in 349 patients with diabetes complicated by tuberculosis treated from 1934 to 1939 inclusive, of whom 274 received insulin, the clinical course of the tuberculosis was distinctly more favorable with protamine zinc insulin than with unmodified or regular insulin.

PREPARATION AND TRANSFUSION OF
SAFE UNIVERSAL BLOOD

ERNEST WITEBSKY, M.D.

NIELS C. KLENDSHOJ, M.D.

AND

PAUL SWANSON, M.D.

BUFFALO

The use of blood belonging to group O as "universal blood" has been practiced for many years. With the rapid increase of the number of transfusions, it has become evident that the transfusion of universal blood is not as safe a procedure as was originally believed. The blood cells of group O cannot be responsible for reactions following a transfusion of universal blood because, with rare exceptions, they are not agglutinated by any kind of human serum at body temperature. The reactions obtained are attributed by many authors to the blood plasma of the donor containing the isoagglutinins anti-A (α) and anti-B (β). In the majority of cases the titer of these agglutinins is not high enough to cause trouble, but in some instances the titer may be high or even extremely high. Cases have been reported in which there are titers occasionally reaching 500 and more. Justification for the administration of universal blood is based on the fact that the blood fluid of the donor's blood will be diluted sufficiently by the blood fluid of the patient to render ineffective the isoagglutinins present in the donor's blood. It is obvious that the dilution factor in high titered O bloods is not sufficient to prevent reactions.

Recently an amendment to the Sanitary Code of the State of New York was adopted by the Public Health Council (June 26, 1940) requiring group O blood to be titrated before it is used as universal blood in order to avoid so-called dangerous universal blood with a high titer of isoagglutinins. There are a number of reports in the literature referring to this dangerous universal blood. The most elaborate analysis of the question was carried out by Gesse,¹ director of the Institute for Blood Transfusion in Leningrad, whose work on hemolytic shock after blood transfusion was the subject of an editorial in *THE JOURNAL*.² Gesse described 46 cases of hemolytic shock following the transfusion of universal blood, 20 of which caused death of the patient. On the basis of his investigations Gesse formulated the following three postulates:

1. Not more than 100 to 200 cc. of universal blood should be transfused.
2. The number of erythrocytes and the hemoglobin content in the blood of the recipient must be determined. Transfusion of universal blood is permissible if the number of erythrocytes is above 2 millions.
3. The titer of the donor's blood serum toward the erythrocytes of the recipient must be determined. Only the blood of a universal donor with a titer of 1:8 to 1:16 can be used.

Even if these three postulates are kept in mind, Gesse warns against the use of the blood of a universal donor unless, in a case of real emergency, homologous blood is not available. He opposes the use of universal blood on a large scale under wartime conditions. He points

to the fact that even if hemolysis is not demonstrable after the transfusion of universal blood into a patient with A or B blood, definite signs of reactions are observed on the part of the nervous system and the cardiovascular system, particularly in regard to the pulse rate.

While it is not within the scope of this article to discuss the advantages and disadvantages of using universal donor's blood in transfusions, the question arises whether it would be possible to develop a procedure which would reduce the reactions following the transfusion of universal blood. More specifically, the problem consists in the elimination of the interaction between the isoagglutinins of the donor's blood and the isoagglutinogens of the patient's cells. Antibodies are best neutralized by the addition of the homologous antigen. A complex carbohydrate-like substance plays an important part in the composition of the so-called group-specific substance A, according to investigations carried out during recent years,³ particularly by Landsteiner and his co-workers.⁴ Convenient sources for the isolation of group-specific substance A are commercial pepsin, mucin and peptone.⁵ In a previous paper we⁶ reported observations on transfusions of group O blood to which a few milligrams of the isolated A-specific substance had been added. The addition of 25 mg. of A-specific substance to 500 cc. of group O blood reduces the titer of the isoagglutinin anti-A considerably or, at times, even completely. The transfusion of such blood into patients with blood belonging to group A proved to be satisfactory.⁶

In order to obtain really "safe" universal blood not only the isoagglutinin anti-A but also the isoagglutinin anti-B had to be neutralized. While studies of the A-specific substance had revealed its nature some time before, conclusive data were not available regarding the B property. After a number of ineffective attempts to isolate the B factor from blood and tissue from various sources, the B substance was finally isolated from the gastric juice of human beings belonging to group B.⁷ The B substance is a carbohydrate-like substance chemically similar to the A-specific substance and also similar to the complex carbohydrates which are recognized as the bearers of the type specificity of pneumococci and other organisms.

After the A-specific and B-specific substances were made available, transfusions were performed with universal blood in which both isoagglutinins anti-A and anti-B were treated with their homologous antigens. The procedure itself is carried out in the following manner:

A 1:1,000 stock solution of group-specific substances is prepared. Twenty-five cc. of stock solution of A substance and 10 cc. of stock solution of B substance are kept in vaccine bottles under sterile conditions and

added to 500 cc. of citrated blood of group O at least five minutes previous to the administration of the blood. It is obvious that the substances could be added to the citrated solution before blood is collected. Somewhat less B substance than A substance has been used because (1) in many instances the anti-B factor in group O blood is weaker than the anti-A factor and (2) there is occasionally a slight reduction of the anti-B factor to be observed by the addition of the A substance, apparently caused by some kind of cross reaction between the A and B substances.

The group-specific substances combine rapidly with the proved by experiments in vitro. of the procedure is demonstrated by comparison of the donor's plasma before and after the addition of the group-specific substances. A few cubic centimeters of blood is taken out of the flask containing 500 cc. of citrated blood of group O. Plasma of blood of group O contains the isoagglutinins anti-A and anti-B. Their strength is determined by mixing serial dilutions of the plasma with human red

tion, while others observe agglutination on slides. Centrifugation of the test tubes increases the degree of agglutination.

So far group O blood that has been conditioned by the addition of A and B substances has been used in forty transfusions. In some instances only the A-specific substance and in other instances only the B-specific substance was added when patients known to have blood of group A or B respectively were treated. About half of the transfusions given contained A and B substances combined. Some of the patients received several transfusions at intervals of ten days to three weeks. No reactions were observed which could be attributed to the administration of group O blood conditioned in the way described or to the effectiveness of the isoagglutinins present in group O blood. It is obvious that the percentage of minor reactions following transfusions is not influenced at all by this procedure. A rise in temperature and urticaria may occur just the same as if untreated blood had been used. Reactions caused by overloading of the circulation or faulty technic certainly are not influenced at all by the neutralization of the anti-A and the anti-B factors in group O blood. The only accomplishment resulting from the addition of A and B substances consists in the neutralization of the possible effect of the anti-A and anti-B factors in group O blood. It is understood that blood of group O exclusively must be used as universal blood and not blood of different blood groups. While it seems to be possible to influence the isoagglutinins present in the blood fluids by the addition of the group-specific substances, it is not possible to change the cell properties A and B present in the blood cells themselves.

COMMENT

The A and B specific substances referred to in this paper are carbohydrate-like structures similar to those isolated from pneumococci and other micro-organisms. These substances are referred to as "haptens" because they usually do not stimulate the production of antibodies when injected intravenously into rabbits. A detailed report on this phase of the investigation will be published elsewhere.

It is interesting to observe that the addition of group-specific substances to normal human serum containing the respective isoagglutinins does not result in precipitation. In order to demonstrate the potency of group-specific substances toward normal isoagglutinins the method of inhibition of agglutination may be applied. This method consists in mixing decreasing amounts of group-specific substances with a constant amount of normal serum containing the respective isoagglutinin anti-A or anti-B. If, for instance, the A substance is mixed with serum containing the anti-A factor an almost immediate combination occurs resulting in neutralization of the anti-A agglutinin as well as of the isolysin anti-A. The degree of that neutralization can be determined quantitatively. The fact that these antibodies have been neutralized is demonstrated by subsequent addition of the A and B cells respectively. There is no agglutination if the isoagglutinins have been neutralized. By means of this test it can be shown that dilutions up to one in several millions may exhibit definite neutralizing effect.

The group-specific substances are protein free. One per cent solutions, when tested with sulfosalicylic acid, do not show any trace of protein. The Molisch reaction in a 1:1,000 dilution is strongly positive, and the products of hydrolysis in acid solution display a high percentage of reducing substances.

Agglutination of Human Red Blood Cells of Group A and Group B Respectively by Plasma of Group O

Test	Dilution of Plasma	Part 1 Before the Addition of Group-Specific Substances		Part 2 After the Addition of Group-Specific Substances

cells belonging to group A and group B respectively. The A-specific and B-specific substances are added before the transfusion is started. The last 5 cc. of blood is collected in a test tube, and the plasma of this specimen is compared with that obtained before the addition of the group-specific substances. A typical experiment is here described:

Decreasing amounts of plasma (volume 0.2 cc.) [part 1, collected before the addition of the group-specific substances, and part 2, collected after the addition of the group-specific substances] are mixed with 0.2 cc. each of a 1 per cent suspension of human red blood cells belonging to group A and group B respectively. After standing for ten minutes at room temperature the tubes are centrifuged for about one minute. The resulting agglutination is recorded in the accompanying table.

The table shows that the plasma of this "universal blood" agglutinates A cells in dilutions up to 1:256 and B cells in dilutions up to 1:128. The addition of the group-specific substances results in a reduction of the agglutinating potency of the plasma to 1:2 and 1:1 respectively. It should be stated in this connection that there has been no general agreement reached as yet as to the method and technic of determining the titer of isoagglutinins. Some workers prefer to keep the tubes at room temperature without centrifuga-

SUMMARY AND CONCLUSIONS

The addition of the isolated group-specific substances A and B leads to a reduction in strength or even elimination of the antibodies anti-A and anti-B present in the so-called universal blood of group O. These group-specific substances, carbohydrate-like in nature, can be added to the blood either before or after collection. Universal blood conditioned in the manner described can be given to any patient independently of the blood group to which he belongs without the necessity of previous determination of the patient's blood group and in emergencies even without cross matching. This blood, when kept in blood banks, is available for immediate use. When it is employed exclusively for all transfusions, no possible mix-ups with blood of different blood groups can occur, one of the main causes of fatalities from transfusion even in the most carefully conducted and supervised laboratories.

Serious objections against the indiscriminate use of universal blood have been raised by a number of investigators, some of them even warning against its use on a large scale in time of war. By eliminating the main objection, namely the possible interference of the isoagglutinins anti-A and anti-B with the A and B cell properties of the patients, such "safe" blood of group O may be considered a "universal" blood. It is obvious that the group-specific substances can also be used advantageously in the reduction of the anti-A and anti-B factors in plasma and serum when indicated.

URTICARIA DUE TO ALIPHATIC ALDEHYDES

A CLINICAL AND EXPERIMENTAL STUDY

BEN Z. RAPPAPORT, M.D.

AND

MURRAY M. HOFFMAN, D.D.S.

CHICAGO

A survey of the literature does not reveal a report of allergy to aldehydes other than formaldehyde. While specific hypersensitivity to solution of formaldehyde either in a free state or as a condensation product in plastics is well recognized and not rare, only 1 such case has ever been studied experimentally. Horsfall¹ in 1934 made a thorough immunologic study of a patient specifically sensitive to formaldehyde. This patient, unlike the one concerned in this study, reacted to formaldehyde only and not to any other homologous aliphatic aldehyde. Horsfall obtained positive cutaneous reactions by the intracutaneous injection not only of formaldehyde (1:8,000,000) but also of various heterologous proteins treated with formaldehyde. A reaction was not obtained with control injections of the proteins not treated with formaldehyde. Despite these specific cutaneous reactions with formaldehyde and proteins treated with formaldehyde, passive transfer antibodies could not be demonstrated in this study.

Harvey of the Physiological Chemistry Department, University of Illinois College of Medicine, gave valuable advice.

1. Horsfall, F. L., Jr.: *Formaldehyde Hypersensitivity: An Experimental Study*, *J. Immunol.* 27: 569-581 (Dec.) 1934.

REPORT OF CASE

History.—A white man aged 27 reported to the allergy clinic of the Research and Educational Hospital, University of Illinois College of Medicine, in July 1937 after a tentative diagnosis of urticaria had been made in the dermatology department of the same institution. The symptoms had first appeared early in July. The patient stated that the onset was gradual, with itching and burning, followed by the appearance of small lesions on the terminal phalanges of the second and third fingers of the right hand and swelling of the upper or lower lip several times a day for about one week. Following the week of onset the lesions became generalized, appearing, in the main, during the evening and night. Sleep became almost impossible. The hives were typical, universal in distribution, pinpoint to giant size (1 to 60 cm. in diameter).

Prior to this time the patient had enjoyed normal health. He had been engaged for the previous four years as a research worker in histology and at the same time completed a course in dentistry. He had always been actively engaged in athletics. In the past he had shown no dermatologic disturbances or allergic manifestations.

The father, mother, two brothers and three sisters are all living and in good health. The father had attacks of asthma for two years prior to the birth of the patient. The cause of the asthma was attributed to dye vapors which he encountered as an employee in the fur dyeing industry. When he changed his vocation, the asthmatic condition disappeared.

Physical Examination.—This was essentially negative except for dermatographia. A mild phyto dermatosis between the toes on both feet was detected. Treatment with a salicylic acid ointment for two weeks caused this to disappear, but the hives persisted.

Allergic Study.—Intracutaneous tests were done with food and environmental substances while other allergic studies were being carried out. Positive cutaneous reactions were obtained with the following: garlic (questionable); 1 plus reactions with banana, hops, cabbage, blackberry, peanut, cocoa, olive, cantaloupe; 2 plus to 4 plus with pea, tea, carrot (well defined), parsnip (very well defined), blueberry, orris root, pyrethrum (well defined). These reactions seemed unrelated to the hives, since the complete elimination of the substances involved caused no change in the condition. It will be noted, however, in the discussion later, that the positive cutaneous reactions may not be without significance in relation to the actual causes of symptoms.

It was early suspected that formaldehyde might be the cause for the patient's urticaria because of his daily contact with it in his work. However, a vacation of two weeks, during which time the patient carefully avoided histologic laboratories or contact with any formaldehyde, failed to bring relief. Because of the constant presence of hives during the first five months of the ailment, it was impossible to study the clinical effect of exposure to formaldehyde or to any other suspected substance.

Dietary studies rigidly carried out for weeks likewise failed to produce benefit. Because of his well nourished condition and the severity of the symptoms, the patient submitted to a starvation period of one week during which time he took only water and rye crackers, without improvement. Elimination of rye was likewise without effect. The effect of removal of various environmental factors by having the patient sleep in a bare room on a canvas cot likewise failed to affect the condition. Physical factors were also ruled out as a cause of his urticaria. Neither heat nor cold influenced the condition.

During the fifteen months that the symptoms persisted the study was continued. No focus of infection was found. Because of the presence of epigastric distress, gastrointestinal studies, including roentgen and stool examinations, were made and found negative except for the presence of hypochlorhydria. The basal metabolism rate was normal. The therapeutic measures that were used to give relief were of little benefit. Hydrochloric acid given orally and intravenously (15 cc. of a 0.05 per cent solution for one week), the daily use of histamine by injection and calcium lactate intravenously produced no improve-

ment. Some relief from itching was obtained by using potassium chloride (30 to 100 grains [2 to 6.5 Gm.] daily by mouth) and an "acid ash" diet. Injections of splenic extract likewise gave relief from itching. The most reliable therapeutic agent for the relief of itching, discovered by the patient, was 1 ounce (30 cc.) of whisky taken four times a day. This proved to be about as effective and more pleasant than frequent injections of solution of epinephrine hydrochloride.

* Twenty-four hours elapsed between successive tests.

† The hives persisted for two to three hours.

‡ The hives persisted intermittently for ten to fifteen hours—itching, restlessness and poor sleep.

During the fifteen month period of symptoms, the patient, a heavy cigaret smoker, was not instructed to abstain from smoking. When the history was reexamined it was noted that at the onset of the hives itching first appeared on the lips and on the fingers of the right hand. This suggested the possibility of cigaret smoking as a cause of the urticaria. To our surprise, the hives subsided completely when smoking was discontinued. To satisfy his own finding, the patient again tried his accustomed brand of cigarets. The hives reappeared after he smoked one or two cigarets. An inquiry from the leading manufacturers for the composition of their cigarets was answered by the statement that the formula was a "trade secret." However, because of the occurrence of hives with brands made by several different manufacturers, the inference was that the harmful agent was a common component of cigarets. Combustion products of glycerin were suspected. This was confirmed by the absence of hives after the patient smoked cigarets which contained diethylene glycol instead of glycerin as the hygroscopic agent. When, however, a small amount of glycerin was introduced with a toothpick into this cigaret, hives occurred after smoking. So sensitive was the patient at this time that during periods of freedom from symptoms hives would appear a few minutes after entering a smoke filled room, or even after shaking hands with some one who had been smoking cigarets shortly before.

On the basis of the known chemistry of the combustion of glycerin, it was suspected that acrolein, $\text{CH}_2=\text{CH}\cdot\text{CHO}$, a pungent and irritating unsaturated aldehyde, was responsible for the reaction. To check this, acrolein was prepared by heating glycerin in the presence of potassium bisulfate. The residue thus obtained was applied to the fingers or lips with a glass rod. Within fifteen minutes the patient broke out in generalized hives. This was further confirmed by the occurrence of hives after eating shallow fried or broiled foods, a process in which a variable amount of acrolein is produced through the oxidation of fat. Deep fried foods (probably because heating of these is less intense) did not produce urticaria. It was interesting to observe that while discomfort did not occur after a meal of boiled beef or fish, the same foods when broiled produced severe urticaria.

Psychogenic Factors.—The many fruitless attempts at an etiologic diagnosis during the long period of study often tempted us to attribute the urticaria to emotional disturbances. There was, however, no manifest reason to suspect any unusual emotional strain during the period of symptoms. Following the discovery of the relationship of the urticaria to acrolein

(and related aldehydes) the patient went through a prolonged period of severe stress, occasioned by the serious illness of his only child, without the recurrence of hives except when induced experimentally.

EXPERIMENTAL OBSERVATIONS

The discovery that the hives could be produced by acrolein again drew our attention to formaldehyde, the aldehyde first suspected as the cause of the hives. There was now a credible explanation for the failure of the hives to clear up when the patient was not in contact with formaldehyde. The use of solution of formaldehyde in the laboratory quickly demonstrated that this compound was also capable of producing in the patient a severe attack of urticaria. We therefore set out to study the effect on the patient of various aldehydes.

The purposes of the experiment were as follows: (1) to determine the effect of other aldehydes related to formaldehyde (aliphatic aldehydes), the concentration necessary for symptoms and the various sites of absorption; (2) to study the effect of unrelated aldehydes, i. e. the aromatic aldehydes; (3) to attempt to determine the effective part of the molecular structure in the production of symptoms.

Experiments with Formaldehyde.—Formaldehyde (HCHO), the first of the series of aliphatic aldehydes, was used in our first studies. All the dilutions were by volume and on the basis of 100 per cent formaldehyde. One drop of a 1:1,000,000 solution of pure formaldehyde in water placed on the lip produced local urticaria of the lip in a few minutes, followed by mild generalized urticaria within ten minutes. To determine whether contact with the skin or mucous membranes was necessary for this effect, 0.02 cc. of a 1:10,000,000 solution of formaldehyde was injected intramuscularly. Contact with the skin or subcutaneous tissue was avoided by using a fine gage needle introduced through a larger bore needle which was first inserted into the biceps muscle. The inner needle was removed after the injection was completed and before the protecting sleeve was withdrawn. Urticaria occurred within thirty-five

Relation of straight chain aldehydes in their capacity to produce urticarial reaction.

minutes after this injection; first on the volar surfaces of the forearms and then on the neck and about the waistline.

To determine the effect of absorption from the gastrointestinal tract, the following tests with dilutions of formaldehyde were performed:

1. Dilutions on a volume basis of pure formaldehyde, ranging from 1:10 to 1:1,000,000, were prepared in gelatin capsules with lactose as a medium. Two sets of capsules were made for each dilution. One set was

enterically coated.² Care was taken that the patient did not expose himself to vapors or solution of formaldehyde for a period of two days preceding and during the test period. After ingestion of any single capsule, twenty-four hours was permitted to elapse before a subsequent trial was made. Table 1 shows the dilutions, trials and results in detail. Slight symptoms (flushed face) occurred with one drop of a 1:1,000 solution of formaldehyde in the gelatin capsules and definite urticaria with the 1:100 solution. With the enteric coated capsules a higher concentration of formaldehyde (1:100) was required for a definite reaction. It is interesting, in view of the effectiveness of the high dilution (one drop of a 1:1,000,000) placed on the lip, that a much higher concentration was necessary to produce urticaria by way of the gastrointestinal tract.

Other Aliphatic Aldehydes.—The effects of other aliphatic aldehydes up to a molecular chain of eighteen

TABLE 2.—Classification of Substances Used Experimentally: Negative Reaction with All Conjugated (Aromatic and Aliphatic) Aldehydes; Positive Reaction Only with Nonconjugated Aldehydes and Acrolein

Substances Tested	Classification	Urticarial Reaction	Time of Onset
Benzaldehyde.....	Aromatic (conjugated)	Negative
Salicylic aldehyde.....	Aromatic (conjugated)	Negative
Vanillin.....	Aromatic (conjugated)	Negative
Furfural.....	Heterocyclic (conjugated)	Negative
Sulfapyridine.....	Amo-amino-pyridine	Negative
Allyl acetal (Hurd).....	Acetal	Negative
Vinyl allyl ether* (Hurd) (CH ₂ =CH—O—CH ₂ —CH=CH ₂)	Ether	Negative
Cinnamic aldehyde.....	Aromatic (conjugated)	Negative
Crotonaldehyde.....	Aliphatic (conjugated)	Negative
Citronellal.....	Aliphatic (nonconjugated)	Positive	20 minutes
Allylacetaldehyde (Hurd)	Aliphatic (nonconjugated)	Positive	Few minutes
Formaldehyde to 18th carbon aliphatic saturated aldehyde (and acrolein); see chart	All aliphatic, all nonconjugated (except acrolein, see text)	All positive	Seconds to minutes

* This compound was tried because it easily hydrolyzes by action of hydrochloric acid to acetaldehyde.

carbon atoms were next studied. Serial dilutions up to 1:1,000,000 of the pure aldehydes were tested. Those below the octaldehyde were diluted in distilled water. Those with more than eight carbon atoms were first dissolved in an equal volume of 95 per cent alcohol before further dilutions were made with distilled water. A few drops of the dilution tried were applied to the lips with a glass applicator.

All simple, continuous chain aldehydes up to stearic aldehyde, C₁₇H₃₅CHO, produced an urticarial reaction. However, as the number of carbon atoms in the aldehyde molecule became greater, the concentration required to produce a reaction was proportionately greater (shown in the accompanying chart). Conversely, the shorter the carbon chain the more effective the aldehyde. The range of dilution ran from 1:1,000,000 for formaldehyde to 1:1 for the aldehyde containing 18 carbon atoms. Interestingly, the curve of concentrations required for a minimal reaction corresponds to the tendency of the solubility curve of these aldehydes. Horsfall¹ in his report suggests that the presence of formaldehyde in traces, as a contaminant in

the higher aldehydes, should be ruled out. The Collins-Hanzlik modification of the phloroglucinol test for free formaldehyde was carried out on higher aldehydes that gave a positive reaction. The result was negative in all cases. The test is sensitive for detection of formaldehyde in a dilution of 1:1,000,000.

CONJUGATION VERSUS NONCONJUGATION

Early in the trials with the various aldehydes it was noted that certain aliphatic double bonded aldehydes and aromatic aldehydes such as benzaldehyde (table 2) did not produce urticaria. Furfural likewise gave a negative result. To investigate further these preliminary experiments, a series of aliphatic double bonded aldehydes and certain aromatic aldehydes were used after the patient had gone through a prolonged period of freedom from hives (table 2).

The results (table 2) showed no reaction with all the aldehydes of these two groups. Inquiry into the difference between the chemical behaviors of the non-reactive and the reactive aldehydes revealed that those failing to produce reactions possess conjugate unsaturation except in one case, namely acrolein, whereas those producing reactions are nonconjugated compounds.³

Since no conjugated aliphatic aldehyde except acrolein produced urticaria in this patient, while all nonconjugated aliphatic aldehydes produced urticaria, a possible explanation of this phenomenon presents itself. It is assumed that the effective aldehydes combine with somatic proteins producing addition products (the allergen) to which the person is sensitive. The aldehyde radical in the nonconjugated compound is free to react with the protein to form such addition products, whereas the conjugated aldehyde, because of its lessened aldehyde reactivity, is unable to initiate this process.

Furfural is a common heterocyclic aldehyde,

Furfural, like benzaldehyde, failed to give rise to any urticarial symptoms.

Allylacetaldehyde, CH₂=CH—CH₂—CH₂—CH=O, was interesting to test because its two double bonds are not conjugated. This compound was found to display ordinary aldehydic reactivity when the patient was exposed to it. The onset of hives was produced in a few minutes.

Allyl acetal, CH₃—CH(OCH₂CH=CH₂)₂, is not an aldehyde but it possesses a potential aldehyde function, since it changes to acetaldehyde on hydrolysis with

3. The phenomenon of conjugation is described briefly as follows: "Organic compounds that contain alternate double bonds in their skeleton such as C=C—C=C or C=C—C=O are classed as conjugated. The former type is a diolefin and the latter is an α, β-unsaturated aldehyde. Compounds of this type are considered to resonate between several electronic structures, with the net result that the activity of the compounds is less than one would infer from the presence of the two double bonds alone.

"Butadiene, for example, may exist not only as CH₂=CH—CH=CH₂ but also as $\overset{+}{\text{CH}}_2-\text{CH}=\text{CH}-\overset{-}{\text{CH}}_2$ (unshared electrons represented by dots). This explains why, in reaction with bromine, the major product is 1,4-dibromo-2-butene, BrCH₂—CH=CH—CH₂Br.

"The simplest aldehyde with conjugate unsaturation is acrolein, CH₂=CH—CH=O. Its resonance modification is $\overset{+}{\text{CH}}_2-\text{CH}=\text{CH}-\overset{-}{\text{O}}$.

(All the unshared electrons are represented by dots. Each single bond represents two electrons, each double bond four electrons). Crotonaldehyde, CH₃—CH=CH—CH=O, represents the next member of this conjugated family. Acrolein and crotonaldehyde differ significantly in their chemical reactivity. If pure, the former will resinify spontaneously, standing for a few minutes, whereas the latter exhibits no such tendency. In general, aldehydes with conjugate unsaturation possess the comparative stability of crotonaldehyde rather than the reactivity of acrolein. This correlates with the activity of acrolein alone among conjugated aldehydes as found in the present work" (C. D. Hurd, personal communication to the authors).

2. The enteric coated capsules were prepared by J. D. Searle & Co., Chicago.

acids. The compound was found to be ineffective in bringing about hives in the patient.

Sulfapyridine is not an aldehyde but its structure made it interesting to test, since the pyridine portion of the compound is substituted by nitrogen in the α position:

The $\begin{array}{c} \text{N} \\ \text{=C} \\ \text{NH} \end{array}$ portion of this compound resembles alde-

hydes in that two bonds from carbon pass to nitrogen, a negative atom like oxygen. In aldehydes or acetals, two bonds from carbon pass to oxygen. Although tests with sulfapyridine were also found to be negative in bringing on hives, it should be pointed out that the pyridine nucleus possesses conjugate unsaturation.

Results with the various compounds are summarized in table 2.

The results with the aromatic aldehydes (benzaldehyde, cinnamic aldehyde, salicylic aldehyde and vanillin), all of which failed to produce urticarial symptoms, lends further support to the application of conjugation and nonconjugation as an explanation for the presence or absence of reaction. The benzene ring is in itself a conjugate system because of the double bonds between alternate carbons of the ring, and the aldehyde group in the cases cited is conjugated with it. The aldehyde radical in such compounds is not free to react with proteins to produce the allergen to which the patient was sensitive.

COMMENT

The urticaria described lasted for fifteen months. The patient has been free from symptoms now since September 1938 except when hives have been experimentally produced. There is, therefore, no doubt of the causative factors. From a clinical point of view the study of this patient emphasized what experienced allergists so frequently underline—the importance of an intelligent, thorough history in the diagnosis of an allergic condition. In retrospect, the story of involvement of the fingers and lips at the onset should have immediately suggested some contact substance, as a cause. However, even this degree of diagnostic accuracy would not have sufficed. It is important to isolate the exact substance in the cigarettes, not for academic reasons but for practical purposes. Otherwise the patient, while avoiding cigarettes, would have continued to have urticaria from acrolein in fried and broiled foods, from formaldehyde in his occupation and from the many other aliphatic aldehydes found in many foods and commonly used essential oils.

In this connection we may now consider the possible significance of the positive cutaneous reactions found by intracutaneous tests in this patient. As previously mentioned, the elimination of the foods and environmental substances to which he reacted produced no change in his urticaria. While from a clinical point of view it is justifiable to assign no importance to such reactions in the absence of symptomatic improvement, it should be noted that most of the allergens previously listed contain in their volatile oils aliphatic aldehydes as well as other aldehydes which are partly responsible for their characteristic odor. Not only the foods but orris root and pyrethrum (pyrethric aldehyde) likewise

contain aliphatic aldehydes. It is possible that the positive cutaneous reactions obtained with these substances were due to the minute amounts of aliphatic aldehydes present in the extract. Some confirmation of this was obtained by the following experiment recently done on the patient. At this time he had been free of hives for two years and eight months except when attacks were experimentally induced: Concentrated extract of garlic 0.3 cc. was applied to the lips and was permitted to be swallowed. Within three minutes the lower lip began to itch. After five minutes the patient felt an uncomfortable "knotty" epigastric distress characteristic of his exposure to acrolein or other aldehydes. After ten minutes, itching of the face, neck, soles, waistline, arms and face was intense. This was followed in a few seconds by severe generalized urticaria and edema. Despite this severe reaction, garlic on intracutaneous testing (with 0.02 cc. of a 1:100 solution of this concentrated extract) had in the original examination given only a questionable reaction.

From an experimental point of view, the question arises whether acrolein formed in the preparation of fried and well broiled foods may not be a cause of specific hypersensitivity. Intolerance to fried foods with symptoms suggestive of gallbladder disease may in some cases be an expression of gastrointestinal allergy to acrolein rather than of organic involvement of the gallbladder. Is the "heart burn" complained of by smokers due in some cases to specific acrolein sensitivity or is it always due to the known primary irritating qualities of this aldehyde or of other combustion products? It is difficult to investigate these symptoms in the absence of objective signs. We have evidence in at least one other patient sensitive to solution of formaldehyde that inhalation of acrolein will produce a typical migraine headache. It is our plan in a future study to combine various aldehydes with serum protein to form a nonirritating allergen for cutaneous tests as one of the methods for studying "heart burn" from cigarettes and fried foods, precordial distress following cigarette smoking and other conditions which may possibly be due to aldehyde sensitivity.

SUMMARY AND CONCLUSIONS

1. A patient whose urticaria was of fifteen months' duration was found specifically sensitive to the aliphatic nonconjugated aldehydes ranging from formaldehyde to an eighteen chain aldehyde.
2. The aliphatic conjugated and the aromatic aldehydes failed to produce symptoms. The exception to this was acrolein, which, while structurally classified as a conjugated aldehyde, is sufficiently reactive to be grouped with the nonconjugated aldehydes.
3. The differences in the reactions with proteins of aromatic and conjugated aliphatic aldehydes as compared with the nonconjugated aliphatic aldehydes is offered as an explanation for the specific sensitivity of the patient to the last group and not to the first two groups of aldehydes.
4. Urticaria was produced with formaldehyde by contact with the unbroken skin, the lip, the stomach (gelatin coated capsules), the intestine (enteric coated capsules) and by intramuscular injection without immediate contact with the subcutaneous tissues. It is interesting that formaldehyde in gelatin coated capsules was more active than that in the enteric coated ones and that contact with the lip was more effective than either of these.

NEOARSPHENAMINE TO MANAGE COURSE OF FEVER IN THERA- PEUTIC MALARIA

C. W. F. WINCKEL, M.D.
Malariologist of the Psychiatric Clinics
AMSTERDAM, NETHERLANDS

Recently Cole and his associates¹ reported on the results of injections of compounds of bismuth and other heavy metals with the object of enabling patients to recover from the effects of attacks of fever in therapeutic malaria. After a few days rest the attacks were allowed to continue till their number was deemed sufficient for the intended therapeutic effect.

In the Netherlands therapeutic malaria in the treatment of dementia paralytica has been applied since 1921. By the cooperation of the two psychiatric clinics in Amsterdam with the zoologic department of the Institute for Tropical Hygiene I have been enabled to keep

and neoarsphenamine. Since 1933, however, for various reasons, these strains no longer have been in use. (b) the Madagascar strain, received from England (Horton Mental Hospital, Epsom) in 1927. This strain differs from the foregoing ones in some respects, particularly as to their sensitivity to neoarsphenamine. The Madagascar strain is still in use for inoculation both by mosquito bites and by the injection of blood.

2. *Plasmodium malariae*: This strain, the causative agent of quartan malaria, was obtained from Vienna (Wagner von Jauregg's clinic) in 1933. It is used mainly for patients in whom, because of their immunity, a sufficient number of attacks of fever cannot be obtained with *P. vivax*. This strain can be transmitted only by the injection of blood, as infection by mosquitoes succeeds only exceptionally.² *P. malariae* is refractory to injections of neoarsphenamine.

The Amsterdam clinics, like many institutions in the United States,³ do not apply therapeutic malaria only but combine this treatment with neoarsphenamine in the

Chart 1.—Inoculation with *Plasmodium vivax*, Dutch strain, by injection of infected blood. On the tenth day neoarsphenamine, 0.15 Gm., was given intravenously because of double tertian fever. Result: Three afebrile days, followed by four chills of simple tertian fever. Spontaneous resistance. Patient was afebrile with numerous parasites in thick blood film.

Chart 2.—Inoculation with *P. vivax*, Dutch strain, by injection of blood. On the twelfth day 0.15 Gm. of neoarsphenamine was given intravenously. Result: Simple tertian fever. On the twenty-second day 0.3 Gm. of neoarsphenamine was given intravenously. Result: Fever stopped after two days.

in stock the strains of plasmodia necessary for the treatment and to maintain a station for the breeding of mosquitoes, so that the inoculation of patients can be carried out both by mosquito bite and by the injection of infected blood. Furthermore, by this means all the other university clinics and hospitals for persons with mental disease in the country can be provided with material for infection by mosquitoes or by blood.

Since 1921 the following parasitic strains have been used in the Netherlands:

1. *Plasmodium vivax*: (a) several strains originating from patients in regions in which benign tertian malaria is endemic (the provinces of North Holland and Friesland). These strains show no difference whatever among themselves nor do they differ in their behavior in response to the usual chemotherapeutic agents quinine

usual increasing doses of 0.15, 0.3, 0.45 and 0.6 Gm. It soon appeared that neoarsphenamine has a double effect in the treatment of dementia paralytica, not only as an antisiphilic drug but also in the management of the course of the fever in therapeutic malaria. The present study deals with the latter effect only.

It has been known for many years that neoarsphenamine is useful in the treatment of patients with benign tertian malaria. Its use, however, is limited, since arsphenamine derivatives alone cannot definitely control the infection. For the final elimination of the malarial parasite quinine is necessary. After inoculation by the injection of blood the infection is always completely controlled by a dose of 5 Gm. of quinine administered in the course of five days. With this method of inoculation relapses do not occur.

Read before the Netherlands Society of Tropical Medicine, Nov. 10, 1940.

1. Cole, H. N., and others: Use of Bismuth Injections to Manage Course of Therapeutic Malaria, *J. A. M. A.* 115:422 (Aug. 10) 1940.

2. de Buck, A.: Infection Experiments with Quartan Malaria, *Ann. Trop. Med.* 29:171 (July) 1935.

3. Leary, P. A., and others: Malaria and Artificial Fever in Treatment of Paresis, *J. A. M. A.* 115:677 (Aug. 31) 1940.

In cases of benign tertian malaria transmitted by mosquito bite, relapses do occur. As, however, by the large number of bouts of fever the patient acquires a high degree of immunity to the malarial infection, the number of clinical relapses is much lower than it is among other patients with malaria. Experience on this point obtained in the Netherlands is briefly summarized in table 1.

In view of these experiences in recent years the malaria course in the Amsterdam clinics, after inoculation both by injection of blood and by mosquito bite, has been cut short by a brief treatment with quinine for five to seven days.

Hardly any patient inoculated with *P. vivax* retains a tertian fever rhythm throughout the treatment, in the course of which the attacks of fever usually double in number and become quotidian. In some patients this occurs early in the series of attacks, in others only at the end. It is often deemed necessary to restore a tertian rhythm for the daily attacks. But even when the fever has preserved its simple type it may be desirable for clinical reasons (a tendency to collapse, general weakness, violent vomiting or incipient jaundice) to interrupt the fever for a few days.

For both purposes I inject a small dose of neoarsphenamine. Quinine is less suitable for these pur-

Chart 3.—Inoculation by mosquito bite with *P. vivax*, Madagascar strain. On the eleventh day 0.05 Gm. of neoarsphenamine was given intravenously because of double tertian fever. Result: Simple tertian fever. On the twentieth day 0.15 Gm. of neoarsphenamine was given intravenously. Result: Patient was afebrile after next day.

Chart 4.—Inoculation by mosquito bite with *P. vivax*, Madagascar strain. On the thirteenth day 0.05 Gm. of neoarsphenamine was given intravenously for double tertian fever. Result: Patient remained afebrile during three weeks, with numerous parasites in thick blood film.

Chart 5.—Inoculation by mosquito bite with *P. vivax*, Madagascar strain. On the thirteenth day 0.075 Gm. of neoarsphenamine was given intravenously. Result: Simple tertian fever. On the twentieth day treatment with quinine was started.

The fact that neoarsphenamine suppresses benign tertian fever by a considerable reduction of the number of parasites in the peripheral blood is made use of to postpone the course of quinine until the antisiphilitic therapy with neoarsphenamine is altogether or nearly completed. In this way there is always blood available for inoculating fresh patients, even when there are no infected mosquitoes or febrile patients at hand, as after a one or two week pause in the neoarsphenamine treatment parasites are nearly always demonstrable in the peripheral blood. It is not necessary to wait until the patient becomes febrile again: In nonfebrile patients one often succeeds in demonstrating the parasites by the thick drop method, as long as no quinine has been taken.

A further application of neoarsphenamine is its use for managing the course of the fever.

poses, as its parasitocidal action is too strong, so that one obtains too long a remission, up to a few weeks.

In the course of several years I have obtained experiences with the Dutch strains of *P. vivax* as outlined in table 2 and have reached the following conclusions concerning these strains:

1. When the patient has double quotidian, an intravenous dose of 0.15 Gm. of neoarsphenamine applied after the attack of fever is as a rule sufficient to convert the duplicate fever into a simple (tertian) one. In one fourth of the cases there are first a few afebrile days. In about another 25 per cent the effect is insufficient; one can then repeat the dose after two to three days.

2. When one wants to interrupt the fever therapy for a few days in order to allow the patient to recuperate, an injection of 0.15 Gm. on an afebrile day is often sufficient for simple tertian fever. When this fails, one can repeat the dose after two to three days.

3. For the sake of definitely cutting short the fever therapy when one does not yet want to give quinine, a first injection of 0.15 Gm. of neoarsphenamine will often prove sufficient, but it is only after injecting 0.3 Gm., followed by the usual series (0.3, 0.45 and 0.6 Gm.) that one may feel sure of success. Treatment with quinine can then be given at the end of the course of neoarsphenamine.

series of neoarsphenamine injections is effective, beginning at 0.15 Gm. and increasing to 0.3, 0.45 and 0.6 Gm.

The effect of neoarsphenamine is clearly illustrated by the fever charts. These charts, like the tables, hardly need any comment. I want only to stress that the various strains of *P. vivax* differ in their response to the drug. The Madagascar strain responds readily to 50 to

TABLE 1.—*Clinical Relapses After Inoculation with Plasmodium Vivax (Benign Tertian Malaria) by Mosquito Bite*

Patients		Treatment Given	Period of Observation, Years	Relapses	
Description	Number			Number	Percentage
From North Holland (Report of the Malaria Committee of the Health Council 1936-1937, Versl. en mededeel. betref. d. volksgezondh., July 1938, pp. 435-460)	Many hundreds	5 to 7 Gm. of quinine sulfate in 5 to 7 days	1½	...	50
From North Holland, Wormerveer (Report of the Malaria Committee of the Health Council 1938-1939, Versl. en mededeel. betref. d. volksgezondh., July 1940, pp. 399-417)	500	Quinoplasmoquine for 2 weeks	1½	116	23
With dementia paralytica (Winckel, C. W. F.: Die Praxis der therapeutischen Malaria, Psychiat. en neurol. Bl. 39: 391 [May-June] 1935)	58	5 Gm. of quinine sulfate in 5 days	1½	9	15.5
With dementia paralytica (Winckel, <i>ibid.</i>).....	81	Quinoplasmoquine for 2 weeks	1½	9	11.1

In patients infected with the Madagascar strain of *P. vivax* a somewhat different behavior was seen, as is shown in table 3.

With the Madagascar strain of *P. vivax* I have made the following observations:

1. When the patient has double quotidian, one intravenous injection of 0.05 to 0.075 Gm. of neo-

TABLE 2.—*Effect on Fever of Single Injection of Neoarsphenamine*

Dose of Neoarsphenamine, Gm.	Indication	Number of Cases	Result			
			No Effect	Lowered Temperature	Simple Fever	Some Days' Remission
0.15	(a) Febris duplicata	141	25 (18%)	13 (9%)	69 (48%)	34 (24%)
	(b) A few days rest needed in simple fever	38	11 (29%)	7 (18%)	..	20 (53%)
0.3	(a) and (b) combined *	39	3 (8%)	2 (5%)	6 (15%)	28 (72%)
Total.....		218				

* Neoarsphenamine kills the malaria parasites best when they are about twenty-four hours old. The injections should therefore be given on an afebrile day.

arsphenamine, given after the end of the attack of fever, as a rule suffices to convert the fever into simple tertian fever. The best results are obtained with 0.075 Gm.; if one gives patients with quotidian fever a dose of 0.1 or 0.15 Gm. the majority will enjoy a few days remission. Therefore, when one wants only to change the fever into a simple tertian one, a dose of 0.075 Gm. is nearly always sufficient.

2. When one desires to obtain a few days complete remission in order to restore the patient's forces, a dose of 0.05 Gm. of neoarsphenamine given on an afebrile day is often sufficient in simple tertian fever. The apyrexia lasts longer when the dose is raised to 0.1 or 0.15 Gm., the optimal dose being 0.1 Gm.

3. When a patient with double quotidian requires a few days rest, an injection of 0.1 or 0.15 Gm., given at the end of the attack of fever, is sufficient. In this case the optimal dose is 0.15 Gm.

4. In case one desires to withhold quinine and still definitely to terminate the fever therapy, the usual

75 mg. and the Dutch strains only to 150 mg. or more. When, therefore, one wants to make use of neoarsphenamine for managing the course of fever one must first make sure of the degree of sensitivity of the parasite strain in use. In addition one must keep in mind that the same amount of a given chemotherapeutic agent (and this is equally true with quinine as with neoarsphenamine) in general becomes more effective as the patient has passed through a greater number of chills and thus supports the action of the drug by an increased amount of resistance developed by his organism.

Useful as neoarsphenamine has proved itself for the regulation of the fever in benign tertian malaria, it is quite useless in quartan malaria (infection with *P. malariae*) the parasite of which is in no way affected

TABLE 3.—*Madagascar Strain of Plasmodium Vivax*

Dose of Neoarsphenamine, Gm.	Indication	Number of Cases	Result			
			No Effect	Lowered Temperature	Simple Fever	Some Days' Remission
0.05	(a) Febris duplicata	72	14 (20%)	2 (4%)	34 (46%)	21 (29%)
	(b) A few days rest wanted in simple tertian fever *	5	5

* Neoarsphenamine kills the malaria parasites best when they are about twenty-four hours old. The injection should therefore be given on an afebrile day.

by the drug. One can profit, however, by this state of affairs by combining fever therapy with a simultaneous series of injections of neoarsphenamine. This practice materially reduces the period during which the patient has to remain in the hospital.

SUMMARY

1. Therapeutic benign tertian malaria often produces undesirable effects when double quotidian develops or when the patient's forces of resistance are too much weakened by the chills and his life is endangered.

2. Intravenous injections of neoarsphenamine constitute a simple means for either changing a double fever into a simple one or for allowing the patient a few afebrile days.

3. Various strains of *P. vivax* are not equal in their sensitivity to neoarsphenamine, and one must first determine the dose required for the strain of parasite in use.

4. Neoarsphenamine cannot replace quinine in the treatment of malaria. For definitely cutting short the fever course, after inoculation by the injection of blood, 5 Gm. of quinine sulfate in five days is required and is sufficient; clinical relapses are not encountered.

5. In cases of infection with *P. malariae* (quartan malaria) neoarsphenamine is ineffective for obtaining a few days pause or for changing a double or triple fever into the simple quartan type.

THE FREI TEST FOR LYMPHOGRANULOMA VENEREUM

EXPERIENCES WITH A NEW ANTIGEN (LYGRANUM)
PREPARED FROM INFECTED YOLK SAC OF
DEVELOPING CHICK EMBRYO

S. EDWARD SULKIN, Ph.D.

WITH THE COLLABORATION OF
PAUL F. FLETCHER, M.D.

ERWIN T. HUBER, M.D.

AND

EDWARD P. REH, M.D.

ST. LOUIS

Since the Frei cutaneous test is the principal confirmatory procedure for the diagnosis of lymphogranuloma venereum, much consideration must be given the availability and specificity of the "antigen" used in the test. At present three sources of antigen are recognized: (a) pus aspirated from the inguinal bubo of a patient with early lymphogranuloma venereum, (b) macerated material from diseased glands and (c) emulsions of the brains of mice intracerebrally infected with virus. Frei test antigen prepared from human pus is not readily available, since cases of lymphogranuloma venereum with fluctuant inguinal buboes are infrequent even in large venereal disease clinics. When such cases are encountered the pus is usually present in small quantities, may vary in "antigen" content in different patients and may be contaminated by the coexistence of other venereal diseases. Macerated material from diseased glands is likewise not readily available. The mouse brain antigen first described by Grace and Suskind¹ does not present these difficulties. An appropriate strain of virus may be transmitted indefinitely through mice.² Contamination may be eliminated with proper and careful laboratory technic, and antigens pre-

pared from infected mouse brains can be standardized. Despite favorable reports³ on the use of mouse brain antigen in the Frei cutaneous test, however, some controversy over the specificity of this antigen has developed. Strauss and Howard,⁴ Wawersig⁵ and Mesrobian and Bruckner⁶ favored the use of the human pus antigen since they found that sensitivity to mouse brain frequently produced false positive reactions. Grace⁷ insisted on the importance of the measurement of the papule produced by the mouse brain antigen and by the corresponding control as the only reliable means of differentiating between nonspecific reactions due to injection of foreign substance and reaction to the presence of the virus. The necessity for this type of exact measurement led Binkley and Love⁸ and their associates to conclude that the test performed with mouse brain antigen is unreliable. European investigators found Frei antigen prepared from monkey brain to be less reliable than human pus antigen.⁹

DEVELOPMENT OF EGG YOLK SAC ANTIGEN

Several attempts have been made to propagate the virus of lymphogranuloma venereum on the chorio-allantois of developing chicks. Miyagawa and his collaborators¹⁰ transmitted the virus to mice after five passages in eggs and were able to demonstrate "granulocorpuscles" in the brains of infected mice. Burnet¹¹ also cultivated the virus on the allantoic membrane of hatching chicks, though no details were given as to the number of passages or the extent of infection. D'Aunoy and von Haam¹² were able to infect the allantois of developing chicks and described specific lesions produced on these membranes. Nauck and Malamos¹³ were able to infect mice after transmitting the virus through six serial passages on the chorioallantoic membrane. According to these workers "granulocorpuscles" were not discernible in the preparations of membrane. In cases in which success was attained in the afore-

LYMPHOGRANULOMA—SULKIN ET AL.

2664

mentioned reports, a relatively low grade infection resulted. More recently Rake, McKee and Shaffer¹⁴ attempted to adapt the virus to the chorioallantoic membrane with the view of increasing its activity. Lesions on the membranes occurred with extreme irregularity, and in no case was the virus lethal for the embryo. The fifth membrane passage showed virus to be present, while none was detectable in subsequent passages. According to these workers, the virus decreased in its virulence for mice or was present in the membranes in low titer. Further attempts to increase the activity of the virus were made by the inoculation of mouse brain virus into the yolk sac of the developing chick.¹⁵ After the fifth serial passage (with material from yolk sacs as the inoculum) the virus readily produced a fatal infection of the developing embryo. In subsequent studies¹⁶ these investigators found that it was not necessary to resort to serial passage to produce a lethal infection of the embryo. Smears made from infected yolk sacs showed numerous granulocorpuscles resembling those described by Miyagawa¹⁷ and Schoen.¹⁸

were tested with the various antigens. A series of intradermal injections was made on the arm, the proximal injection being made with human Frei antigen, two middle injections with egg and mouse brain antigens and two distal injections with the corresponding controls, as is shown in the accompanying illustration. The inoculum consisted of 0.1 cc. of each antigen. Whenever possible the reactions were read within forty-eight to ninety-six hours. Two diameters of the central papule or indurated area were measured with a millimeter scale and recorded. The size of the surrounding erythematous area was not recorded.

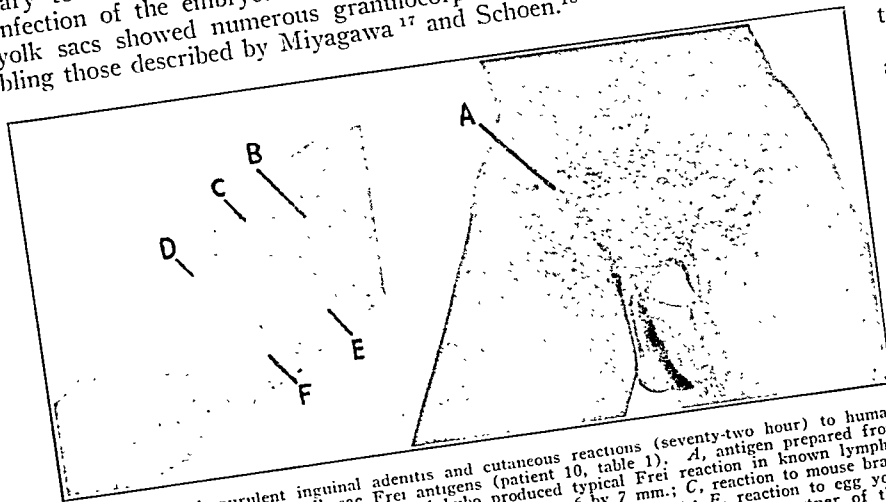

A typical positive reaction consists of an elevated reddened central papule which appears within twenty-four to forty-eight hours and is surrounded by an erythematous areola. In the Negro the erythematous halo is not always easily discernible. The papule reaches its maximum size in about three days, gradually decreasing thereafter. In strong reactions the papule may have a vesicular or pustular center. The positive reaction may be discernible for several days and sometimes heals with distinct pigmentation at the area of injection.

Of the 42 persons tested, 40 gave a positive, 1 a doubtful and 1 a negative reaction to yolk sac antigen; 34 gave a positive, 5 a doubtful and 3 a negative reaction to mouse brain antigen and 38 gave positive, 1 a doubtful and 3 a negative reaction to human pus antigen. Thirty-three persons had positive reactions with all three antigens. All doubtful reactions to mouse brain were positive when the egg and human antigens were used. The criteria recommended by Grace⁷ were used in interpreting the results. The diameter of a papule indicating the upper limit of a negative reaction was 6 mm., while a papule 7 mm. in diameter or larger was considered indicative of a positive reaction.

A reaction to normal mouse brain control material (with the average diameter of the papule about 3.6 mm.) occurred in 29 of these persons, while only 16 reacted to the control yolk sac material (with the average diameter about 2.8 mm.), indicating greater incidence in sensitivity to the former. The results are presented in table 1.

A control group of 20 persons with no evidence of present or past infection were also tested. None of these persons gave evidence of infection, since no cutaneous reactions were produced with a potent, freshly prepared Frei antigen made from human material. Only 2 showed slight (2 to 5 mm.) reactions to human Frei antigen. Every person in this series gave a cutaneous reaction to either mouse brain antigen or control material, although all were below the upper limits of a negative Frei reaction (6 mm.). Three subjects reacted to the lygranum control, while 6 showed a reaction to the antigen, all below 4 mm. in diameter. The results are shown in table 2.

TESTS FOR HYPERSENSITIVITY TO EGG ANTIGEN
It is generally known that any foreign substance when injected intradermally into a human subject will produce an inflammatory response at the site of inoculation. The severity of the reaction will be influenced by any hypersensitivity to the material in the person

Patient with purulent inguinal adenitis and cutaneous reactions (seventy-two hour) to human pus, mouse brain and egg yolk sac Frei antigens (patient 10, table 1). A, antigen prepared from pus aspirated from fluctuant right inguinal bubo produced typical Frei reaction in known lymphogranulomatous patients. B, reaction to human pus antigen, 6 by 7 mm.; C, reaction to mouse brain antigen, 12 by 16 mm.; D, reaction to mouse brain control, 3 by 5 mm.; E, reaction to egg yolk sac antigen, 8 by 10 mm.; F, egg yolk sac control; no reaction. The marital partner of this patient is referred to in table 1 (patient 11).

MATERIALS AND PROCEDURE

The present study was undertaken to establish the value of infected material from egg yolk sacs (lygranum)¹⁹ as a Frei antigen for use in the diagnosis of lymphogranuloma venereum. The specificity and sensitivity of this material was compared with that of mouse brain²⁰ and human pus antigens. The latter was prepared from pus aspirated from fluctuant unruptured inguinal buboes, according to Frei's²¹ technic. Forty-two patients²² with active lymphogranulomatous infection or with a history of past infection

inoculated. This must be considered when one interprets the cutaneous response to any Frei "antigen." None of the persons tested in the studies of Grace and Suskind¹ showed natural hypersensitivity to the protein of mouse brain. Only 1 of 65 persons showed acquired hypersensitivity to mouse brain protein after having received nine tests during a seven month period. Of the 42 patients with lymphogranuloma venereum dealt with in table 1, none showed natural hypersensitivity to the egg yolk sac material. Moreover, none of 11 persons in the control group of normal persons retested after two weeks and again after three weeks showed either natural or acquired hypersensitivity to the yolk sac material, probably because the Frei antigen and the corresponding control material as prepared by

Rake, McKee and Shaffer¹⁴ is relatively free from the constituents of yolk sac. No attempts were made to ascertain whether sensitization to the virus occurs.

COMMENT

Antigen prepared from the yolk sac of the developing chick embryo infected with the virus of lymphogranuloma venereum can replace that prepared from

infected mouse brain or from human pus for performing the Frei cutaneous test. That yolk sac antigen (lygranum) is superior to mouse brain antigen in sensitivity and specificity is evident from an analysis of the results obtained in 42 patients with lymphogranuloma venereum and 20 nonlymphogranulomatous persons. In

5, or 11.9 per cent, of the cases of lymphogranuloma venereum, the papules appearing in reaction to control mouse brain material were 5 mm. or more in diameter and were indistinguishable from those seen in positive Frei reactions. In each of these cases a positive diagnosis could be made with the yolk sac antigen or with the material from human pus. Throughout the investigation the reactions to mouse brain were invariably more intense than those resulting from human pus or yolk sac material. The average diameter of the papule in a positive reaction to mouse brain antigen and to control material was 10.7 mm. and 3.6 mm., respectively, while positive reactions to yolk sac antigen and control material were 9.5 mm. and 2.8 mm., respectively. Nonspecific papules were produced in 29 of the 42 lymphogranulomatous persons receiving control mouse brain material, while only 16 patients showed reactions to the lygranum control material.

The experience with the new antigen (lygranum) prepared from the infected yolk sac of the developing chick embryo presented in this report substantiates the recently reported observations of Grace, Rake and Shaffer.²³

CONCLUSIONS

1. Yolk sac antigen (lygranum) is superior to mouse brain antigen for performance of the Frei cutaneous test for lymphogranuloma venereum.

2. Comparatively few nonspecific reactions are produced with the egg control material as compared with the mouse brain control.

3. The most satisfactory confirmatory procedure for the diagnosis of lymphogranuloma venereum is the Frei cutaneous test with yolk sac antigen (lygranum).

TREATMENT OF MENINGOCOCCIC MENINGITIS AND MENINGOCOCCEMIA WITH SULFADIAZINE

JOHN H. DINGLE, M.D., Sc.D.

LEWIS THOMAS, M.D.

BOSTON
AND

ALLAN R. MORTON, M.D., C.M., M.P.H.

HALIFAX, NOVA SCOTIA

In August 1940 the city of Halifax, Nova Scotia, experienced the beginning of an epidemic of meningococcal meningitis which gradually increased in intensity during the next six months, reaching an apparent peak of case incidence during January and February 1941. The total number of hospitalized patients during this period was 93, of whom 82 were treated with sulfapyridine. The cases of 20 of these patients have been reported by Black and MacKenzie¹ and by Reid and Turner.² Seven

The opportunity to study this disease at the peak of the epidemic arose during a survey of epidemic infectious diseases undertaken by a group from Harvard Medical School, headed by Dr. J. Howard Mueller. The survey was conducted with the consent and cooperation of the health and medical authorities of Halifax. At that time the use of sulfadiazine for various infectious diseases³ was being studied in the Boston City Hospital. Preliminary observations had indicated that sulfadiazine was considerably less toxic than other sulfonamide drugs and that it was effective in endemic meningococcal infections. Permission to extend these observations to epidemic meningitis was granted by the Office of Public Health and Welfare of Halifax.⁴

In this paper are included 11 consecutive patients admitted to the Infectious Disease Hospital of Halifax from the latter part of January through February. These patients were treated with sulfadiazine, and all recovered. Also included here are 3 patients with sporadic meningococcal infection treated with sulfadiazine at the Boston City Hospital. Two of these patients had meningitis and 1 had meningococemia and arthritis without evidence of meningeal involvement. One of the patients with endemic meningitis died.

CLINICAL ASPECTS

The relevant data concerning the individual patients are recorded in the accompanying table. One of the patients (case 7) was 2 years old; the others were adolescents and adults ranging in age from 14 to 60. The duration of illness before treatment varied from five hours to six days, with the exception of that of the patient with meningococemia (case 14) in which twenty-three days elapsed before chemotherapy. The majority of the patients presented the typical picture of meningitis on admission. The onset was sudden with malaise, followed rapidly by headache, stiff neck, nausea and vomiting. The individual patients showed considerable variation in the severity of illness. All except 1 (case 10) had an elevated temperature either at the time of admission or within a few hours thereafter.

BACTERIOLOGIC STUDIES

Initial lumbar puncture in the 13 cases of meningitis revealed turbid fluid under increased pressure. The diagnosis was confirmed bacteriologically⁵ in all cases but 1 (case 5), in which fluid was obtained five hours after onset. Stained smears of the cerebrospinal fluids revealed gram-negative intracellular diplococci in 9. Meningococci were grown from the fluids in 9 of the 12 cases in which cultures were taken. Blood cultures were made in 12 cases, but meningococci were found in only 1.

Nasopharyngeal cultures were taken in 8 cases, of which 5 were positive for meningococci. Repeated swabs in 3 of these cases were negative by the second or third day of treatment and remained negative. In 1 instance, culture was negative on admission, positive on the second day of chemotherapy and negative there-

Clinical course in 13 cases of meningococcal infection. SD = sulfadiazine; B.C. = blood culture. Cases 1 to 12, meningococcal meningitis; case 14, meningococcal meningitis with arthritis.

deaths occurred in the entire sulfapyridine-treated group: 1 of the deaths was of a patient with diabetic acidosis, 3 occurred shortly after admission, and 1 was attributed to obstructive hydrocephalus which appeared as a late complication. In the other 2 cases the disease progressed without complications but terminated fatally in spite of sulfapyridine and specific serotherapy.

Dr. Thomas is Fellow of the Frederick Tilney Memorial Fund. This study was aided in part by a grant from the William W. Wellington Fund of Harvard Medical School.

From the Thorndike Memorial Laboratory, Second and Fourth Medical Services (Harvard), Boston City Hospital, and the Departments of Medicine and of Bacteriology and Immunology, Harvard Medical School, and from the Office of Public Health and Welfare, Halifax, N. S.

4. Dr. D. J. MacKenzie, director of the Provincial Public Health Laboratory, Mr. Henry Ross and the staff of the Infectious Disease Hospital also gave their assistance. The sulfadiazine and the serums for meningococcal typing used in this study were supplied by Lederle Laboratories, Inc.

5. The isolation of these strains was accomplished by Dr. J. Howard Mueller and his associates on a casein hydrolysate-starch agar medium (Mueller, J. H., and Hinton, J.: Personal communication to the authors).

after. Para-amino-benzoic acid was employed as an inhibitive agent in all cultures taken after chemotherapy was instituted.⁶

The epidemic strains of meningococcus were determined to be type I, both by agglutination and by the quellung reaction.⁷ The strains in the 3 Boston cases did not give a quellung reaction, but Dr. Sara E. Branham of the National Institute of Health identified two of them as type II by agglutination. The biologic properties of these strains will be reported elsewhere.

METHOD OF TREATMENT

The same general plan of treatment was followed in all cases. Four Gm. of sulfadiazine was administered

Blood levels⁸ of free and total sulfadiazine were determined between the third and the sixth day. The values obtained are charted. Chemotherapy was continued for a period of six to eleven days.

Supportive therapy was employed as indicated. No antimeningococcic serum or specific agents other than sulfadiazine were employed. Fluids were administered orally or parenterally in amounts sufficient to permit excretion of approximately 1,500 cc. of urine daily.

Diagnostic lumbar puncture was performed on admission, but the procedure was repeated only for definite indications such as signs of increased intracranial pressure or failure of response to therapy.

RESULTS

The general course of each patient may be seen in the last three columns of the table and in the temperature records reproduced here. In 11 of the patients with meningitis considerable clinical improvement was apparent on the second or third day of chemotherapy, as indicated by relief of malaise and headache and return of appetite. Temperature responses of most patients were prompt and occurred simultaneously with the sub-

8. These determinations were performed by Miss Helen Robertson in the Chemical Laboratory of the Department of Pathology, Dalhousie University Faculty of Medicine, through the kindness of Dr. R. P. Smith. The method of Bratton and Marshall (A New Coupling Component for Sulfanilamide Determination, *J. Biol. Chem.* **128**: 537 [May] 1939) was used.

jective improvement. One patient with meningitis (case 6) showed no apparent response to chemotherapy during the first three days. On the third day the free sulfadiazine level was only 2.6 mg. per hundred cubic centimeters of blood. He was given 2 Gm. of sodium sulfadiazine intravenously in addition to the usual oral dose; on the following day the blood level was 7.5 mg. (free) and symptomatic improvement had begun. Another patient (case 12), a primipara in the eighth month of pregnancy, made an uneventful recovery and was delivered at term of a normal infant. The 12 patients with meningitis who recovered became free of symptoms after an average period of five days. There were no recurrences, and recovery was complete without residuals. One patient in the Boston group (case 13) died ten hours after admission and received only 7 Gm. of sulfadiazine. The blood sulfadiazine level shortly before death was low (2.8 mg., free and total), and the cerebrospinal fluid showed only a slight trace of the drug. Attempts to culture meningococci from material obtained at autopsy, however, were unsuccessful.

The patient with meningococcemia was a man aged 24, an Italian, who had been ill with fever and joint pains for six days before entry. There was no history of gonorrhea and he stated that he had not been exposed to it. The right elbow and right ankle were tender but not hot or swollen. Repeated blood cultures were positive for gram-negative diplococci which were identified as meningococci. Repeated complement fixation tests and prostatic smears and cultures were negative for gonococci. There was no evidence of endocarditis. Recovery was prompt on administration of sulfadiazine; the temperature remained normal, and all blood cultures made following chemotherapy were sterile.

Complications which probably were attributable to sulfadiazine were encountered in 2 cases. In 1 of these (case 3) pain of right ureteral distribution developed on the eighth day of chemotherapy. The pain lasted several hours. Urine voided at this time showed from 10 to 15 red blood cells per high power field and numerous sulfadiazine crystals in uncentrifuged specimens. In the other (case 12) pain in the right flank associated with microscopic hematuria developed on the eighth day, but no sulfadiazine crystals were found. The urine in both cases cleared rapidly after cessation of chemotherapy. Nausea, vomiting, dermatitis, cyanosis or mental symptoms attributable to the drug were not present.

An adequate statistical comparison of the therapeutic efficacy of sulfapyridine and sulfadiazine cannot be made from these data. Clinical impressions indicated that the two drugs were about equally effective against the meningococcus. Sulfadiazine had the advantage of being considerably less toxic.

SUMMARY

Sulfadiazine has been employed as the sole specific agent in the treatment of 13 patients with meningococcal meningitis and 1 with meningococcemia with arthritis but without meningitis. One patient with meningitis died ten hours after admission. The remaining 13 patients recovered promptly and completely.

Glycogen Storage.—About 500 Gm. of glycogen are, on an average, stored in the body, about 100 Gm. in the liver, and practically all the rest in the skeletal muscles.—Wright, Samson: Applied Physiology, New York, Oxford University Press, 1940.

Clinical Notes, Suggestions and New Instruments

PERFORATION OF UTERUS BY HYDATIDIFORM MOLE

H. E. BOWLES, M.D., HONOLULU, TERRITORY OF HAWAII

Since perforation of the uterus by a hydatidiform mole is an extremely rare condition, it is felt that the presentation of the following account is justified.

In both Lord's¹ case in 1868 and Seitz's² in 1904 the outcome was fatal. Then followed a series of cases in which treatment by supracervical hysterectomy was successful. One was reported each by Waldo³ in 1910, Harkness⁴ in 1921, Krellenstein⁵ in 1924, Mazet⁶ in 1926 and Kallinikoff⁷ in 1928. Kallinikoff's patient was a multipara under the age of 25, as was Johansson's⁸ patient in 1929, who died after hysterectomy. Bland's⁹ patient in 1927, a nullipara aged 30, died fourteen months after the original operation following exploration of a recurrent chorioepithelioma. The first operation was performed at a time when the hydatid mole was undergoing malignant change. Gizowski¹⁰ reported another patient with such a uterine perforation in 1934, and McClure¹¹ in 1935 added an account of a woman aged 24 who was operated on with a diagnosis of ectopic pregnancy and who recovered after a blood transfusion and pan-hysterectomy. So far as I can tell the twelfth case to be reported was that of Conway¹² in 1938, in which the patient was a septipara aged 51 who died with *Clostridium welchii* peritonitis. If the figures are correct, our case is the thirteenth.

It was my privilege recently to consult with and to assist Dr. K. C. Chock in the following case, which had all the earmarks of a ruptured tubal gestation with peritoneal inundation. The case is presented with Dr. Chock's permission.

REPORT OF CASE

L. M., a Hawaiian woman aged 44, was admitted to the surgical service of the Queen's Hospital on Aug. 18, 1940 with complaints of severe, diffuse pain in the lower part of the abdomen and vaginal bleeding. She flatly denied having made any attempts to induce abortion. A persistent, painless dripping of bloody fluid from the vagina had begun on June 11 and had persisted intermittently to the time of admission to the hospital. At noon, on the date of admission, the patient was seized with agonizing pain in the left lower quadrant of the abdomen. She was seen shortly after the onset and was pale and in obvious shock. At this time an indefinite mass could be felt in the lower part of the abdomen mostly to the left of the midline. Tenderness gradually shifted to the right lower quadrant of the abdomen as well, and on admission, five hours after onset of the pain, the tenderness was diffuse and agonizing.

The past history was chiefly one of a succession of pregnancies and was otherwise essentially negative. This was the patient's sixteenth pregnancy. There were eight living children and there had been two stillborn. The other pregnancies had terminated in early spontaneous abortion. The menses had been regular and painless from the time of her last delivery three years and seven months prior to the present admission to the hospital except for amenorrhea of eleven months' duration. At her last labor she had been delivered of stillborn 8 month macerated twins weighing 5 pounds 4 ounces (2,381 Gm.) and

4 pounds 10 ounces (2,098 Gm.) respectively. The cause of the fetal deaths was obscure. The Wassermann and Kahn reactions of the blood were negative.

Physical examination revealed that the patient was obese and was in shock, with a pale gray face, a feeble, rapid pulse and clamminess of the extremities. Her underwear was soaked with bright red blood, and she complained of agonizing generalized abdominal pain. The temperature was 97 F., the pulse rate 120, the respiratory rate 24 and the blood pressure 68 systolic and 50 diastolic (?). There was exquisite tenderness of the entire abdomen and dullness of the flanks on both sides, although the patient's condition was too poor to warrant testing for shifting dullness. A wave of fluid was elicited, and a large tender mass the size of a grapefruit was felt in the midabdomen, rising up and out of the pelvis. On pelvic examination the cervix was noted to be soft, and there was exquisite tenderness of the cul-de-sac with the feel of a downward bulge caused by collected fluid. The diagnosis on admission was ruptured ectopic pregnancy or ruptured ovarian cyst.

Laboratory Data.—On admission the red blood cell count was 3,000,000 and the white blood cell count 32,000, with 90 per cent neutrophils and 10 per cent lymphocytes. A donor whose blood was compatible was found, and a transfusion of 550 cc. of citrated blood was given by the indirect method before operation and again immediately after operation.

Operation.—As soon as the patient's condition improved after the initial transfusion, the abdomen was opened through an incision along the midline. Anesthesia with nitrous oxide and ether was given. Approximately 1,000 cc. of blood and blood clots was found and most of it removed by aspiration and by mopping with gauze tapes. During the process a firm mass of tissue the size of a lemon and yellowish red was lifted out of the cul-de-sac. This was quickly incised with a scalpel and was seen to contain many cystic tumors of varying size suggesting a typical hydatid mole. The uterus was inspected next. Its size was approximately that of a three months pregnant uterus. To our dismay a ragged, 4 cm. rent was found on the posterolateral surface of the uterus, as shown in figure 1 A. This rent was plugged with firm blood clots when seen. It admitted three fingers easily. The uterus was removed, the incision being carried around from the end of the tear. The adnexa on each side were normal in appearance except for congestion. The left fallopian tube and ovary were removed with the uterine body but the right adnexa were retained and were used as a tampon to plug the rent. The tissues here were friable, and sutures cut through until we drew the right adnexa pedicle down as a stopgap (fig. 1 B).

The incision was closed in layers without drainage, and the second transfusion of 550 cc. of citrated blood (making a total of 1,100 cc.) was given. The patient's condition was much improved at the close of the operation.

Pathologic Report.—Gross: The specimen consisted of a uterus and a mass of yellowish red tissue measuring 13 by 8 by 6 cm. The surface was irregular, roughened and friable, with adherent blood clots. Sections showed reddish gray friable tissue with areas of hyaline substance almost cartilaginous in consistency. There were a number of spaces lined by a grayish membrane approximately 1 mm. thick, containing clear fluid. The largest cavity measured 1.5 cm. in diameter. An area of brownish red friable tissue was noted at one side extending into the substance of the mass, resembling blood clots. The uterus measured 12 by 11 by 6 cm. The serosal surface was smooth and yellowish pink, with several areas of recent hemorrhage. The right fallopian tube and ovary were attached. The entire cervix was not included. The area of attachment measured 8 by 7 cm. and was rough and severely hemorrhagic. Sections showed yellowish pink myometrium with prominent vessels. The wall measured 3 cm. and had loosely adherent bits of dark reddish gray, friable tissue on the posterior surface. The tissue near the site of removal was dark red and hemorrhagic, with adherent portions of blood clots. The ovary measured 3 by 1.5 by 0.8 cm. The surface was slightly roughened and hemorrhagic. Sections showed grayish stroma with an occasional small cyst. The fallopian tube measured 7.5 by 0.5 cm. The fimbriae were free and the surface of the ostium was smooth. Sections showed no gross abnormalities. A nodule

2 by 1 by 1 cm. was noted at the base of the mesovarium medially which on section showed connection with ovarian substance. The mass consisted of a solid area of yellowish, slightly translucent tissue. There were nine sections.

Microscopic: Sections of the fallopian tube showed thickened, edematous plicas and a wall infiltrated by scattered acute inflammatory cells. The epithelium appeared intact. The lumen contained irregular groups of mononuclear and polymorphonuclear cells and areas of serum. Sections of the ovary showed a large mass of moderately degenerated corpus luteum cells with a central area of pigment and relatively loose fibroblastic tissue. The corpus luteum resembled that seen in pregnancy. Sections of myometrium showed large muscle cells, many congested vascular spaces and scattered groups of mononuclear cells. The vascular spaces just beneath the endometrium were large. The endometrial layer was moderately thick and irregular, with decidual reaction and scattered groups of chronic inflammatory cells. This area was vascular also. Glands present were in the late luteum phase. No placental tissue was identified in relation to the endometrial layer. Other sections of myometrium and endometrium showed a similar picture. There was no evidence of a neoplasm. No cervical tissue was identified. A few areas of myometrium showed apparent necrosis of tissue with groups of acute inflammatory cells and blood cells. The vessels appeared normal. Other sections showed groups of large, irregular structures with delicate central network containing spindle cells of the adult Langhans type and a surrounding darkly staining

A, uterus, showing line followed by rent. B, sutured stump showing how right adnexa were used. U = uterus; T = tear; XY = line along which remainder of stump was amputated; V = vagina; CS = cervical stump; RA = right adnexa.

syncytial layer resembling placental villi. Many of the structures were larger than normal placental villi. None appeared definitely cystic. The syncytial cells were occasionally seen in small groups along the edge of the villous structures without evidence of invasion or malignant action. Certain areas of this tissue were hyaline with complete loss of cellular detail. Other areas showed myxomatous trabeculated tissue approaching a cystic character.

Diagnosis.—The patient's condition was diagnosed as (1) a hydatid tumor, with (2) decidual reaction, (3) corpus luteum of pregnancy (?), (4) chronic endometritis, (5) chronic metritis and (6) acute salpingitis.

Subsequent Course.—A third transfusion of blood (500 cc.) was given on the day after operation, without untoward results. The patient left the hospital in good general condition twenty-eight days after operation. There was some infection of the wound, and healing occurred by granulation. On discharge, however, the incision was firm. The red blood cell count at this time was 4,670,000, with 80 per cent hemoglobin.

To date the condition of the patient has been satisfactory, and she now attends to her daily duties as a housewife and mother. Friedman tests have continued to give negative results.

SUMMARY

1. Spontaneous perforation of the uterus by a hydatid mole has been reported twelve times in the literature available to us. The case reported here is the thirteenth.

881 Young Street.

LEGAL RESPONSIBILITY FOR MEDICAL MALPRACTICE

IV. MALPRACTICE CLAIMS IN THE UNITED STATES AND A PROPOSED FORMULA FOR TESTING THEIR LEGAL SUFFICIENCY

HUBERT WINSTON SMITH, A.B., M.B.A., LL.B.
BOSTON

This is the fourth of a series of six articles on "Legal Responsibility for Medical Malpractice." The three previous articles were published in The Journal March 8, May 10 and May 31, respectively.

This study has ranged widely; I shall now narrow its orbit and focus sharply on the American scene. The first case of malpractice to be carried to an American court of appeal, so far as I can discover, was that of *Cross v. Guthery*, decided by the Supreme Court of Errors of Connecticut in 1794 (2 Root 90, 1 Am. Dec. 61).

The plaintiff brought an "action on the case" against the defendant, a "practicing physician who professed to be skilled in surgery." The plaintiff alleged that his wife had a "scrofulous humor" in one of her breasts which required its removal and that he employed the defendant, who performed the operation "in so unskillful and cruel a manner, that the plaintiff's wife survived by but three hours." The plaintiff prayed for damages in the sum of £1,000 to cover his costs and expense and to repay him for the deprivation of the service and company of his wife.

The defendant pleaded a compromise, alleging that the plaintiff had previously relinquished any claim for malpractice in exchange for cancellation of a £15 book account incurred in the wife's treatment. The plaintiff traversed this plea by denial of such a compromise. On offer of proof, the jury found that no such compromise had been agreed on and returned a verdict in the plaintiff's favor for £40 damages and costs. One reads:

Defendant moved in arrest of judgment on the ground that the offense charged appeared to be a felony, and by the laws of England, the private injury was merged in the public offense.

The Supreme Court said:

The declaration is sufficient. The rule urged by the defendant is applicable, in England, only to capital crimes, where, from necessity, the offender must go unpunished, or the injured individual go unredressed.

The peculiar ground on which the decision is based is explained by the fact that the defendant had placed his sole reliance on the alleged compromise. When the jury found against him on this question of fact, he seized on the foregoing ingenious but far fetched contention as the only prospect for reversal. It should not be thought that the court supposed the plaintiff's right rested on the necessary proof of a crime. It was simply using a ready answer to dispose of the narrow contention presented by the appeal. The "record" did not require any discourse on legal responsibility for medical malpractice. That the court did not intend to imply that civil responsibility exists only when the malpraxis amounts to a misdemeanor or a crime is shown by its later opinion, in 1812, in the case of *Grannis v. Branden* (5 Day 260, 5 Am. Dec. 143). In this case the Connecticut Supreme Court of Errors upheld a

judgment against a physician based on alleged negligent conduct of a child birth. It rested its decision exclusively on the civil law of negligence, being of opinion that the facts showed both negligent omission (nonfeasance) and negligent commission (misfeasance). The first consisted of the physician's failure to give proper care to the expectant mother for two days preceding the birth; the latter consisted of affirmative unskillful acts in procuring delivery, with resultant wounding of both mother and child.

Much is heard and said about the peril of malpractice claims, but there is a definite lack of accurate information by which one might appraise the reality and the size of this hazard. It would be instructive to know in what states the problem is most acute. In an effort to replace surmise by a more factual appraisal, I have undertaken to collect all the civil malpractice appeal cases decided by American courts from 1794 to Jan. 1, 1940.¹ These have been arranged in tabular form to facilitate comparison. The information raises some challenging inquiries and affords more points of discussion than can be pursued in this paper. I found, among other things, that:

1. A total of 1,513 appeal cases came before American courts between 1794 (first case, *Cross v. Guthery*) and Jan. 1, 1940. These, as preserved precedents, constitute the American common law controlling civil responsibility for medical malpractice.

2. Up to 1860, when the outbreak of the Civil War occurred, there had been only 23 appeal cases; by 1900 the total had risen to 217 and by 1940 to 1,513.

3. There has been a vast increase in these cases since 1900, and, as the chart shows, the percentage increase of this malpractice litigation for ten year periods up to 1940 far outstripped the percentage increase in the number of physicians or in the population. Other factors must account for the remarkable rise.

4. Of the 1,513 cases, decisions in only 15 were handed down by the federal courts. This is explained by the fact that only infrequently is there a basis for federal jurisdiction. Since malpractice jurisprudence rests on common law and involves no federal question, the sole basis on which a federal court might assume jurisdiction is diversity of citizenship. When the plaintiff and the defendant are citizens of different states and the amount in controversy is \$3,000 or more, exclusive of costs and interest, the plaintiff may sue in the federal court, or defendant by proper removal proceedings, timely filed, may remove the case from the state to the federal court at his election (United States judicial code, title 28, section 41). Thus, the only occasions when malpractice cases are apt to be encountered in the federal courts are when a patient from one state has placed himself under the treatment of a physician who is a citizen of a sister state.

5. There is a distinct correlation of the increase in cases of malpractice with the increase in urbanization. The incidence of malpractice cases seems to be higher in metropolitan centers than in small towns.

6. Cases of fracture constitute the most important single type of case. Claims arising out of the nonuse or the negligent use of roentgen rays form another

1. Because of the vast growth of American common law precedents, with more than 1,000,000 appeal cases since 1900, even careful research is not a guarantee that one has located all the authorities. I believe, however, that the table is correct, within a small range of error, and I am sure that any mistake is in the direction of understatement. Only civil actions against physicians and surgeons for alleged malpractice are included; similar actions against hospitals or nurses are excluded, as are prosecutions for alleged criminal malpractice and proceedings under medical practice acts.

large group of cases. Obstetric cases form an important group, and surgical cases constitute a fourth group of considerable size.

7. The majority of cases are based on alleged dereliction of the physician himself rather than on the negligence of his agent or employee.

8. Only occasional cases are against "quacks" or rest on ignorance or alleged lack of qualification. The great majority are against qualified physicians for failure to use average "due care" or "skill" in the particular transaction.

Increasingly, failure to possess or to exercise due skill, rather than lack of care, is becoming the basis of complaint.

In the tables the figures showing the total number of cases per state should be of particular interest to lawyers or to those interested in seeing what states are contributing the most law to the jurisprudence of malpractice. Individual physicians will be more keenly interested in examining the columns which show the incidence of malpractice appeal cases per million of population and per physician. The tables were designed to permit study of judicial evolution and to make possible certain statistical interpretations. In making calculations of rates, population figures were taken from the records of the United States Bureau of the Census; the figures for the number of physicians per state are census figures of the American Medical Association, and the incidence of malpractice cases per state was determined by my own legal researches.

To just what extent does the number of appeal cases represent a reliable index of the magnitude of the malpractice problem and the size of the risk to the average physician in a particular state? A moment's reflection will show that only cases which involve a substantial "stake" are apt to go to the appeal courts: it is not economically worth while to appeal a controversy in which the attorney's fee and the costs will exceed the amount in dispute. Appeal cases, both theoretically and actually, represent judgments ranging from \$1,000 to \$50,000 and are the malpractice claims apt to prove damaging or financially ruinous to the physician. They usually represent cases in which the patient has suffered a grave or disabling injury.

Lawyers know that cases in this group are, for the most part, fought to the courts of last resort, since the large damages sought militate against a compromise if there is even a faint hope of reversal. Defendants also recognize that a period ranging from several months to two years may expire before the highest courts of a particular state dispose of the appeal. During this time a plaintiff can get very hungry and may prove open to a compromise calling for much less money than the judgment. Thus, not only sharp differences on points of law but cogent practical reasons have a bearing on the number of trial court judgments carried to a higher court by appeal.

What were the chances in the ten year period from 1930 to 1940 that an average physician in a given state actually ran of finding himself in an appeal court as a party litigant to a malpractice controversy of substantial magnitude?² In North Dakota, the state with the highest incidence of cases per physician, the rate was 0.015, and hence the chances were 15 in 1,000 for the ten year period and 1.5 in 1,000 for each year. In North Carolina, the chances for the whole ten year period were 7 in 1,000; in Colorado, 4.1 in 1,000; in

Texas, 2.6 in 1,000; in Massachusetts, 2.4 in 1,000; in New Jersey, 2.1 in 1,000; in New York, 1.3 in 1,000; in Pennsylvania, 1 in 1,000, and in Nevada and New Mexico the risk was 0. To find the "chance" per year, each of these figures must be divided by 10. Calculations for each state can be made from the tables. It appears that for the physician not engaged in work with fractures, in the practice of surgery or obstetrics or in the use of the roentgen ray for diagnosis or for therapy the actual risk was much below this crude rate. Such a physician, handling a select practice, with few itinerant, transient or recognizable "trouble-making" patients, and armed with a reasonable knowledge of his legal position and accustomed to keeping good records and observing certain medicolegal precautions, may justly expect a lower insurance rate conformable to his status as a preferred risk and also may be influenced by these considerations in arriving at the amount of malpractice insurance he will carry.

It is evident that cases decided by appellate courts represent only a fraction of the complaints of negligent practice; they form the apex of a pyramid of which the parts may be represented thus:

- (1)—[Apex of the pyramid]: Cases actually carried to an appeal court (Table 1 has figures for each state)
- (2)—[Multiply (1) by 3]: Cases disposed of on judgment of the trial court, by payment or by compromise, without appeal
- (3)—[Multiply (1) by 9]: Claims compromised or abandoned after a suit was filed but before trial
- (4)—[Multiply (1) by 20]: Claims compromised by payment of money before any suit was filed
- (5)—[Multiply (1) by 100]: Claims in which action against the physician was considered, but the patient was dissuaded, without payment of money or cancellation of bill, or he abandoned the claim voluntarily
- (6)—[Multiply (1) by 1,000]: Instances in which the physician had been negligent in fact or in the patient's opinion, but no consequence ensued except, perhaps, a loss of good will or a change of patronage.

I hold this schematization out not as an accurate statement of the exact ratios but as an approximation of what seemingly is the order of distribution. I have not been able to get figures from malpractice insurance carriers to establish the ratios. Yet from indirect methods of estimation it appears that the foregoing schematization, based on an accurately known "apex" of appeal cases, represents the approximate truth and will at least serve to give a tentative conception, pending such time as I am able to work out still more accurate multiples. Unfortunately, trial court records are not classified according to the type of case, and accurate information about the broader substratum represented by (2), (3), (4), (5) and (6) cannot be procured by the usual processes of fact gathering.

These multiples may be applied to a concrete example. In Massachusetts from 1930 to 1940, the known number of cases reaching the appellate courts was 18; according to the "pyramid" the number of claims settled after judgment but before appeal (3×18) would be approximately 54; the number of claims compromised or abandoned after a suit was filed but before trial (9×18) would be approximately 162, and the number of claims compromised before the filing of any suit (20×18) would be approximately 360. If it is assumed that in one third of the appeal cases the defendant wins or obtains a reversal of the plaintiff's judgment, with a remand of the cause to the lower court for retrial, and that in two thirds of the appeal cases the plaintiff prevails, the latter cases would total 12. Substantial sums of money are rarely paid in settlement before a suit is filed.

These estimated numbers of claims on which money awards were made or money was paid have been tabulated (table 3); the average number of physicians in

2. I refer, of course, to materialized risk based on past experience, but this is the orthodox basis for prognosticating future risk.

Massachusetts between 1930 and 1940 was taken as 7,263. One can contrast with these the much larger group of cases in which the physician was negligent in fact or in the opinion of the patient, but the incident did not eventuate in a money settlement. The latter cases have been represented in table 4.

This analysis, tentative though it is, indicates that the risk which the average individual physician carries of

502 of these cases were appealed during the decade from 1930 to 1940 leads to the inference that in the future one may expect compensation to be demanded more often from physicians, with a transfer of many heretofore "potential" claims into the active sphere. One is also led to the conclusion that the crucial consideration for the physician is medicolegal prophylaxis. Since the instances of actually or supposedly negligent

* Included are only the opinions of appellate courts. Such opinions are published and preserved and form an addition to the common law, serving as precedents in future litigation. Not included are the far more numerous judgments of trial courts. These govern a particular case in the trial court but as a rule are not accompanied by published opinions, form no part of the preserved common law and exert but little influence as precedents.

having to pay large awards or large sums in compromise of malpractice claims is low and that the risk is a little larger in respect to intermediate and petty claims but that the great majority of actionable malpractice transactions constitute a potential reservoir, with no present payment of money involved. The fact that 1,513 cases have reached the appeal courts of the United States during the period from 1794 to 1940 but that

conduct are for the most part potential claims only, the interest of the physician lies in the direction of keeping them potential. This he can do in large measure by keeping adequate records, by holding himself in all respects to the level of practice in his community and by keeping in mind the medicolegal bearings of transactions which he must learn to recognize as involving hazard.

In other words, I wish to reiterate the assertion made in part I of this study that it behooves the physician to know the pattern of his legal position as well as possible.

Courts of all states, in evolving the law represented by the 1,513 appeal cases, have depended almost entirely on principles of common law, with free and constant reference to the decisions of sister states. The principles

a rapidly rising incidence may indicate the operation of a variety of factors, as for instance:

1. Increasing expectations directed toward physicians as medical standards advance and the public becomes informed of what is medically possible.

2. Trends toward urbanization, with its several consequences, such as: (a) the increase in "transient" patients of unknown temperament; (b) higher standards

*Liability of Physicians and Surgeons for Medical Malpractice**

† Rate of increase in the population of continental United States: 1790 to 1800, 35.1 per cent; 1800 to 1810, 36.4 per cent; 1810 to 1820, 38.0 per cent; 1820 to 1830, 33.5 per cent; 1830 to 1840, 32.7 per cent; 1840 to 1850, 35.9 per cent; 1850 to 1860, 35.6 per cent; 1860 to 1870, 26.6 per cent; 1870 to 1880, 26.0 per cent; 1880 to 1890, 25.5 per cent; 1890 to 1900, 20.7 per cent; 1900 to 1910, 21.0 per cent; 1910 to 1920, 14.9 per cent, and 1920 to 1930, 16.1 per cent. The number of physicians in continental United States in 1936, according to figures gathered by the American Medical Association, was 165,167, of which number 21,013 were in New York; 12,889, in Pennsylvania; 11,672, in Illinois, and 10,859, in California. The number of medical graduates in 1937 was 9,767, as against 8,691 in 1936 and 8,041 in 1935. The annual number has not fallen below 7,000 since 1924, when the total was 6,671.

‡ Rural population means under 2,500.

of law applicable to physicians have been substantially alike in the several states, so that only in an occasional situation does the physician have a liability in one state which he would not have in another. It seems that this variation does not affect the incidence of malpractice appeals. I do not overlook the fact, however, that

of practice; (c) the difficulty in maintaining the degree of physician-patient intimacy which exists in rural communities or small towns; (d) the increased number of industrial hazards, of cases of fractures and of other transactions which carry greater risk of malpractice; (e) the availability of a larger body of physicians to

draw from to serve as expert witnesses in making the necessary proof, and (f) the availability of a larger bar, with a greater chance of finding an attorney willing to handle the claim.

3. Advent of new diagnostic instrumentalities, such as the roentgen rays, which cause previously unsuspected or latent negligence to become patent.³

TABLE 2.—Incidence of Appeal Cases of Civil Malpractice in Jurisdictions of the United States According to Population and Number of Physicians

4. The sheer number of cases in a community or a state, with their varying degrees of publicity, which may create a public awareness of medical responsibility in law.

5. Encouragement to suit afforded by the presence of malpractice insurance. Though it is a reversible error, as a consideration calculated to bias the jury, for the plaintiff to disclose in the course of a trial that the defendant has malpractice insurance, the plaintiff's lawyers usually have means of discovering the presence of such insurance. Obviously, a plaintiff is more apt to sue when he is sure that any judgment obtained will be collectible, and he is less apt to compromise for as small a sum as he might accept from an unprotected defendant of limited financial resources.

6. Industrialization of certain areas.

3. Roentgenograms were pressed into service as medical evidence soon after Roentgen's discovery of x-rays. The first American case in which they were offered seems to have been *Smith v. Grant*, 29 Chicago Legal News, 145, Dec. 3, 1896.

7. Presence of hazardous occupations in a given area, as for instance the numerous cases of fractures apt to be encountered in certain western states in connection with "logging" camps or in states with high automobile collision rates.

TABLE 3.—Malpractice Claims on Which Money Was Awarded or Paid in Massachusetts Between 1930 and 1940

	Number	Average Amount Involved	Rate per 1,000 Physicians *	
			For 10 Yr.	For 1 Yr.
Appeal cases.....	12	\$1,000 or more	1.65	0.165
Trial court judgments settled before appeal †	54	\$500 or more	7.43	0.743
Claims compromised after suit was filed but before trial †.....	162	\$100 to \$1,000	22.30	2.230
Petty claims compromised before suit was filed, either by paying money or by canceling bill †.....	360	\$3 to \$200 (occasionally higher)	49.50	4.950
Total.....	588		80.88	8.088

* The average number of physicians in Massachusetts between 1930 and 1940 was 7,263.

† Estimated number.

8. Flux or rapid change in the population, particularly with reference to newcomers, strangers and transients in the community. Such factors seem to play some part in the increasing tide of malpractice cases in California.

9. Possible shift of policy on part of defendants from early settlement to "last ditch" fight in appellate courts. Clearly, if defendants resolve to carry most cases involving \$1,000 or more to an appeal court as a matter of course, such a policy of protracted litigation may cause the number of appeal cases to rise out of all proportion to the increase in the number of underlying malpractice situations. To determine the effect of this factor one would need a statement from malpractice

TABLE 4.—Instances of Negligence by a Physician, in Fact or in the Opinion of the Patient, in Massachusetts Between 1930 and 1940 Which Did Not Eventuate in a Money Settlement

	Number *	Amount Involved	Rate per 1,000 Physicians †	
			For 10 Yr.	For 1 Yr.
Cases won by physicians in trial courts; claim against physician considered but abandoned without active assertion (100 × 18).....	1,600	Varies widely; usually small	243	24.8
Instances in which the physician was negligent in fact or in the opinion of the patient, but no consequence ensued except, perhaps, a loss of good will or a change of patronage (1,000 × 18).....	18,000	Varies widely; usually small	2,450	248.4
Total.....	19,600			

* Estimated.

† The average number of physicians in Massachusetts between 1930 and 1940 was 7,263.

insurance carriers (so far not forthcoming) as to how many of the cases appealed since 1900 were taken up by companies and a statement of the number of large (not petty) claims compromised by payment of substantial sums as compared with the number of such claims carried to the appeal courts before payment. Such data might explain in part the inordinate per-

centage increase in appeal cases over the percentage increase in physicians and in population from 1900 to 1940.

It is not my intention to place a mathematical valuation on these factors, which seemingly account for the rise in the number of malpractice cases reaching American appeal courts. In each community they may have a different relative importance. Also, each local practitioner will know what peculiar or additional factors have a bearing on the malpractice problem in his own community.

The tables are offered as a statement, accurate within a small range of error, of the incidence of malpractice appeal cases. The reader is invited to interpret these data as he sees fit and even to apply different multiples to ascertain the lower tiers of the malpractice "pyramid" if he has more accurate information as to ratios in his particular locality. My inferences seem to fit in with the data available and are put forward to replace the fog of conjecture as to the size of the malpractice problem with at least a crude approximation of objective fact. Should insurance carriers be able to show by authenticated records the need for revision of some of these inferences, it might become necessary to reconsider certain statistical aspects of the problem in a later publication.

It would be interesting to the medical profession to know whether malpractice insurance merely relieves against the annoyance of petty claims and what the odds are that the physician in taking a policy buys a ticket for a long journey through the appellate courts because of the larger malpractice claims which may be urged against him. Some malpractice cases have been to the appeal courts two and three times and have been kept in litigation for as long as fifteen years. Naturally, under the ordinary insurance policy, the sole discretion as to whether a claim shall be compromised or defended rests with the insurer, and the physician may at times have to cooperate in a defense contradicted by his better judgment or have his protection forfeited. This is a serious problem in regard to all malpractice insurance written by private companies, for the economic interest of the carrier may well be advanced by vigorous defense and protracted litigation. The physician may have an opposing interest in early compromise as a means of conserving his time and protecting his reputation against too long a sojourn in the courts. Whether these two interests can be reconciled with fairness to both the physician and the insurer will determine the success of their mutual relations and will enable the physician to decide for himself the value of a proposed insurance coverage.

It seems significant that between 1615, when the decision was reached in the case of *Everard v. Hopkins*, first of the modern malpractice cases in English law, and 1940 a total of less than 100 cases have come before the appeal courts of the British empire. This bears comment since the doctrines of medical responsibility under English law are quite similar to those applied in the United States, and a plaintiff has like rights of access to the courts and like powers of appeal. I make this comparison with reservation, since the volume of American appeal cases on all subjects exceeds that of the British. Yet the fact that in certain years between 1930 and 1940 no malpractice cases reached the British appeal courts, with only a handful for the ten years as contrasted with 502 in the United States, seems to bespeak a profound difference in the

way the malpractice problem is being handled in the British empire and the way it is handled in the United States.

In summing up, one gains the impression that the malpractice hazard varies considerably in different sections of the United States. The physician should consult the tables to get an idea of the incidence of appeal cases (the controversies involving large sums worth fighting over) both per physician and per million of population in his state. He will then ask himself the following questions:

1. Am I engaged in hazardous practice, such as work with fractures, the practice of surgery or obstetrics, the diagnostic or therapeutic use of roentgen rays or other types of work calling for dramatic changes of the patient's status quo or affirmative action as compared with more cautious watchful waiting? If so, my average risk may be larger than the crude rate; if not, it may be even smaller.

Percentage increase in population (dash line), number of physicians (dotted line) and number of civil malpractice appeal cases (solid line) in United States from 1900 to 1940. Values for 1900 were used as the basis for all calculations.

2. Am I located in a community carrying special risks of injury or showing heavy industrialization? Is my practice to a large extent made up of patients who are transient, "unknown" or strangers, or is it a select practice among conservative people of known stability who would be slow to assert a claim of negligence?

3. Am I practicing in a large urban center with more impersonal relations to patients than a rural or small town practitioner enjoys?

4. Am I equipped with the knowledge, judgment, care and skill possessed by fellow practitioners of my community who belong to the same group (such as general practitioner or specialist) and to the same "school of medicine"? Am I able to apply these qualities consistently in the contacts I have with patients?

5. Am I subject in my practice to the risk of fraudulent claims by persons of unknown temper or moral character?

6. Am I conversant with the more important principles governing my legal position, so that I can avoid future trouble by taking pertinent precautions in advance?

In addition to the large group of transactions already mentioned in which the patient is the moving actor, another large group exists in which alleged malpractice is put forward as the ground for refusal to pay a medical bill. Most courts hold that a medical contract is "entire" and not "separable." Therefore, the negligence of a physician in any phase of a continuous treatment defeats his whole bill and not merely the charge for the negligent visit. When the physician files suit for services rendered, the patient may plead malpractice in defense. He may go still further and in the same case file a counter claim for affirmative damages. In such event, he becomes plaintiff in respect to the counter claim, and the physician becomes defendant. In effect, these are two separate cases being tried together: the main action for the medical fee and the counter claim, or so-called "cross action," for malpractice. This procedure is justified on the ground that since both controversies arise out of the same transaction all disputed questions can be settled conveniently in a single proceeding without multiplicity of suit. Sometimes, an unscrupulous patient threatens to plead "malpractice" if sued for his bill, trafficking on the natural desire of the physician to avoid aspersions against his professional conduct.

Every malpractice contention will present itself either as (1) an affirmative claim by a patient, which may be (a) a bona fide assertion or (b) fraudulent or so wholly lacking in foundation as to compel the inference that the patient is acting in bad faith, or (2) a "defensive" claim set up in opposition to the physician's bill for services rendered, to which either (a) or (b) may apply.

The physician should distinguish carefully between the bona fide and the unconscionable type of case, for the two types fall into different categories, both legally and morally. Moreover, from the standpoint of practical trial strategy, one must never forget that the favorite sport of average jurors is to unmask fraud; their one predictable allegiance is to their instinctive or formulated conception of what would be a "square deal" on the merits. Psychologically, this sometimes turns on a subconscious vindication of their own inherent decency. Juries of high or of low moral caliber tend to follow this consideration with amazing uniformity, as a sort of compass in the fog of disputed fact. Let the fact come home to a jury, through the evidence or through inescapable psychologic impressions, that the moving party behind a contention seeks unjust enrichment by a false claim or by a fraudulent trick or device, and the reaction of the jurors is promptly to block the way by adverse fact findings in their verdict. Hence, in cases tinged with fraud, the attorney for the physician has a brilliant opportunity for a crushing cross examination and exposure of the adverse litigant's true position.

When a physician has done his best, in conduct prosecuted with good faith, he may be tempted to look on the assertion of negligence by a patient as a fraudulent imposition. But the law does not force the patient to assume all the risks any more than it requires the physician to be a guarantor of treatment. If there is a substantial ground on which a patient can reasonably believe he has suffered from the negligence of another, even though he is mistaken, the law has an interest in

protecting his free access to the courts so that the bona fide issue may be tried. The very purpose of the courts is to settle such disputes as fairly as possible. The purse-sparing propaganda that a physician must fight every malpractice claim to save the "honor" of the medical profession has often clouded clear thinking. It has led to the defense of more than one claim which should have been compromised. The ordinary case of civil malpractice does not involve moral turpitude but is an action seeking compensatory damages for simple negligence; every case is not an "indictment" of the medical profession which calls for the cooperation of all good practitioners in saving the common honor whatever the merits of the claim.

When, on the other hand, a claim is asserted fraudulently, though the law cannot cut off the plaintiff's right of access to its tribunals without prejudging the very question to be tried, a new question is presented. The patient in such case is trying to use the courts as a vehicle for his fraud and unjust enrichment. Physicians and lawyers who knowingly espouse such causes should be reprimanded and regulated by their professions. Thought should also be given to the question of whether the medical profession should not support proper legislation to confer on trial court judges, in event of the finding that the claim was asserted fraudulently or without any bona fide foundation, the discretionary power to tax against the offending party not only court costs but an allowance to the injured party for reasonable attorney's fees and compensation for expense and loss of time. At present, even if the physician prevails in such a case, the judgment in his favor causes only the bare court costs to be taxed against the plaintiff. There are no uniform state statutes allowing him to recover a further amount to cover his reasonable attorney's fee and expenses of litigation.⁴

The law has always abhorred any rule which might intimidate a citizen in the assertion of a legal right or deter him from having his day in court. This policy is manifested in several ways. Thus, whatever a litigant says in pleading his case or as a witness is privileged and cannot be made the foundation of an action for libel or slander by an opposing litigant who claims his reputation has been injured thereby.⁵

More debatable, therefore, is the question whether injury to the physician's professional reputation by the filing of a groundless suit could properly be made the subject of special damages. The suggested legislation, alone, might well deter the assertion of many "nuisance value" claims.

It is true that a witness who falsifies while under oath in a civil proceeding may later be prosecuted criminally for perjury. Yet, since such prosecution is a criminal law proceeding, the indictment needs to be proved beyond a reasonable doubt; and for a number of reasons, abuse of civil proceedings by a fraudulent plaintiff cannot be adequately dealt with by this method.

The problem of the "nuisance value" case is one of the most pressing of the law's unsolved problems. It is not peculiar to cases affecting physicians. All such cases rest on a common formula: X with a groundless or unsubstantial claim, on the merits of which even he does not expect to prevail, files a suit against Y. Y must answer and defend or suffer a default judgment. The

4. McCormick, C. T.: *Handbook on the Law of Damages*, St. Paul, West Publishing Company, 1935, p. 234.

5. On proper motion in advance of trial, judges will strike out frivolous, scurrilous or malicious pleadings, visibly intended to discredit the other party and not to serve as a basis for proposed proof. Again, trial courts will prevent the introduction of testimony of like character on timely motion by the offended party.

trial will involve time and expense, and Y's attorney's fee to defend the case will be, for example, \$300. Even if Y wins, he cannot recover the attorney's fee. X offers to compromise for \$200. Under such an arrangement, Y is not making a compromise settlement of a "bona fide" equity. Lawyers who knowingly espouse such claims are reprehensible. Fortunately, few will do so, but the door is open to considerable hardship in the case of the physician, for he must consider not only the relative costs of the alternative courses of action but the undesirable effect a suit may have on his professional status.

The statute suggested would need to be drawn to conform to constitutional guarantees. The main requirement of similar legislation was held by the United States Supreme Court, in *Missouri, K. & T. Ry. Co. of Texas v. Cade* (233 U.S. 642, 34 S. Ct. 678, 58 L. Ed. 1135-1914), to be the avoidance of discrimination against persons affected, under the "equal protection" clause of the federal constitution.⁶

EVOLUTION OF A FORMULA FOR TESTING THE LEGAL SUFFICIENCY OF A MALPRACTICE CLAIM

In the face of this large and growing body of malpractice law, is it possible to get away from the confusing minutiae of individual cases and evolve a formula which will fit them all? Invaluable as reviews of current cases may be, the physician is still in need of a critique by which all malpractice situations may be judged. If this paper can convey to him a reasonable rationale, its purpose will be fulfilled. Its object is thus to orientate the subject rather than to exhaust it.

The method used to arrive at a formula has been to analyze a large number of cases in the light of this inquiry: What are the irreducible essentials of all malpractice actions?

Suppose the defendant, after filing an answer to a malpractice action, sits back and says: "Let the plaintiff prove a case if he can." The minimum legal components which an unopposed plaintiff must prove by a preponderance of the evidence to entitle him to recovery may justly be called the essentials of plaintiff's prima facie case.

In dealing with the law of malpractice, if the non-essential language of the decisions and collateral considerations is pushed aside, one finds that these minimum legal components necessary to support recovery may be stated for all transactions as: (1) duty (due from defendant to plaintiff), plus (2) breach of duty, plus (3) proximate causation, plus (4) injury to plaintiff (damage). These may be recast into a formula easier to keep in mind: (1) duty, plus (2) dereliction, plus (3) direct causation, plus (4) damage.

If the physician will hold fast to the individual identity and the indispensability of each of these four components, the "four D's," he will be able to break down and understand any malpractice problem. This is a fundamental point of departure, and much of what follows will be an elaboration of these telescoped concepts.

6. Amendment XIV. Constitution of the United States: "Article XIV, Section 1: All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws."

DUTY

Example.—Plaintiff, X, proves dereliction, direct causation and damage and rests his case.

The evidence shows that X one day was riding on a subway train. He fell into informal conversation, without introductions, with Y, a pleasant gentleman sitting next to him. X volunteered that he had long been suffering from constant, severe headaches which acetylsalicylic acid did not help. Y remarked that he had known of some cases in which such pain was relieved only by aminopyrine. X, chancing to look down at a case carried by his new acquaintance, saw embossed in gold thereon, "John J. Johnson, M.D., City Hospital." That night he had his cousin, an employee in a drug store, send him some aminopyrine. This drug afforded delightful relief, and he continued to take it daily. Severe granulocytopenia developed, with resulting physician's bills and loss of time from work.

For these damages, X files suit against Y. He offers medical testimony showing that the aminopyrine was the probable cause of the granulocytopenia and that prudent local practice calls for its administration in regulated amounts and with periodic studies on the blood. The plaintiff also offers evidence that the physician's bills and expenses incurred in his treatment were reasonable and testimony establishing his loss of earnings during the sickness. Thereupon, he rests his case. The defendant offers no evidence but files a motion for an instructed verdict asserting that the plaintiff has not made out a prima facie case of malpractice entitling him to go to the jury.

The court must instruct a verdict for the defendant, Y. Y made his remarks in a casual way and not in his identity as a physician or for the specific reliance of X. He was not putting forward his information in a professional way. The information imparted was general and not of the specific quality of personal medical advice.

Clearly, no implied contract of employment was intended by either party. X had no notion of engaging Y in a professional capacity nor Y of making a charge, nor could it be said that Y by his remarks undertook the gratuitous treatment of X as his patient. From the revealed circumstances, no duty can be made out, and the plaintiff's case must therefore fail.

(But note that such duty, and therefore a prima facie case, would arise if the facts were slightly different. Suppose the following is the case: X looks at the bag of Y and says: "Oh, I see you are Dr. Johnson," and explains his ailment and impecunious condition. Y says: "Look here, my friend, come down to the outpatient department, and I shall treat you gratis." Thereafter Y administers aminopyrine in a negligent manner to X as a gratuitously treated outpatient. Y may be liable for malpractice.)

DERELICTION

Example.—Plaintiff, X, proves duty, direct causation and damage and rests his case.

The evidence shows that X, a concert violinist, sustained a Colles fracture of the left radius and a fracture of the scaphoid bone when he fell while skating on the ice. He called Y, who reduced and set the fractures, but a poor recovery followed, with final deformity and limitation of the movements of the hand, which incapacitated X as a musician.

He files suit against Y. He offers evidence of the damage sustained through loss of earning power. He offers medical testimony that the function of his left

hand and its fingers has been impaired permanently. He testifies in his own behalf as to the stiffening of his wrist and his inability to play his instrument successfully. Other musicians give supporting evidence that he has lost his previous delicate fingering, so essential in rendering difficult compositions. The plaintiff thereupon rests, and defendant files a motion for an instructed verdict.

The court must instruct a verdict for the defendant, Y. X has not made out a prima facie case, for he has failed to prove dereliction or fault. The law does not make Y an insurer or guarantor that his treatment will be successful. He is responsible only for negligence, and when negligence depends on a medical dereliction it cannot be proved by lay testimony; its proof requires the evidence of qualified experts. The bad result of treatment, if extreme, may constitute some evidence of negligence but not enough to satisfy plaintiff's burden of proof on his prima facie case. It will not carry the case to the jury, for the reason that a trial court or appellate court could not permit a jury verdict of negligence to stand when based on evidence of the result of treatment alone.⁷

When evidence is so unsubstantial that reasonable men could not found a verdict on it, the trial court, on timely motion, has a duty to take the case from the jury and instruct a verdict against the party failing on his burden of proof. Conversely, if a plaintiff offers such strong testimony, not contradicted by credible evidence, that no reasonable man could find to the contrary, the trial court (on timely motion) has a duty to instruct a verdict for the plaintiff. If by oversight or through mistaken judgment the trial judge submits a case to the jury when the evidence is insufficient to support a verdict for the plaintiff (or vice versa), he may rectify the error after verdict by granting a new trial. In some states he may enter judgment notwithstanding the verdict ("judgment non obstante veredicto") in favor of the party who was entitled to an instructed verdict in the first instance. Suppose, for example, a plaintiff has made out a prima facie case of malpractice, while the defendant has not offered prima facie evidence making out a defense. The plaintiff files a motion for an instructed verdict, which the court overrules, permitting the case to go to the jury. A verdict is returned for the defendant, and the plaintiff files motion for judgment "notwithstanding the verdict," which the trial court denies, entering judgment instead in favor of the defendant. On appeal by the plaintiff, the higher court is entitled to say: "Whether there was sufficient evidence on the part of defendant to create a disputed issue of fact warranting submission to the jury presents a question of law and is, therefore, a proper subject for our review. Only jury findings of disputed fact are binding on us." The appeal court accordingly will reverse and render the judgment, taking it away from the defendant and awarding it to the plaintiff (or vice versa, as the case may be). In event the jury has not returned findings on the amount of damages, the higher court may simply reverse and remand the case for a new trial. In any event, it is clear law that an appeal court has power to disturb a judgment on the ground that the verdict on which it depends rests on evidence too unsubstantial to warrant a reasonable man's basing fact findings on it.

7. A rare exception exists in cases to which the doctrine of "res ipsa loquitur" applies, but its application is admitted by so few courts and restricted to such exceptional cases that the subject may be passed by for the time being.

DIRECT CAUSATION

Example.—Plaintiff, X, proves duty, dereliction and damage and rests his case.

X's evidence shows that her husband, Z, received a mortal injury to the brain in an automobile collision. He was taken to a police station in a nearby town. Y, the police surgeon, examined the unconscious man, found no evidence of the damage to the brain, entered a diagnosis of intoxication and left him overnight at the station house, negligently failing to put him in a nearby hospital, where roentgenograms and lumbar punctures would have revealed the condition. Y had been told that Z had been unconscious for over an hour as the result of a bad automobile crash. A day later Z was taken to his home, where he was attended for four days by a local physician. On failure to improve, he was transferred to a hospital, where the correct diagnosis was established. He was in a moribund condition and died within seventy-two hours of admission.

X, the surviving spouse, files suit against Y, seeking damages for wrongful death. After introducing the foregoing evidence in support of her allegations of negligence, X rests her case. Y files a motion for an instructed verdict.

The court must grant an instructed verdict for Y. It is not enough that a plaintiff shows dereliction and damage; he must show a causal relation between the two. When the injury in respect to which the physician is negligent is itself a sufficient cause of the damage, as the death here, the plaintiff has the burden of showing that the physician's dereliction was a substantial contributing cause. In this case the plaintiff would need to prove that had Y exercised due care and referred Z to the hospital because of the story of trauma and the continuing unconsciousness, probably Z's life could have been saved. Such likelihood is a prognosis dependent on expert knowledge and so would need to be shown through the testimony of qualified physicians. Having failed in such proof of causation, X has not made out her prima facie case. The jury cannot be allowed to rest a verdict on mere supposition or surmise or to compensate X in respect to an injury (death of her husband) which, from all the evidence shows, was as likely to have resulted irrespective of Y's negligence and despite the best of care. (*Ramberg v. Morgan* [Supreme Court of Iowa] 1928, 218 N.W. 492 is an actual case so holding).

DAMAGE

Example.—Plaintiff, X, proves duty, dereliction and direct causation and rests her case.

The evidence shows that X, being pregnant and feeling labor pains, called in physician Y. After a time, seeing that progress was slow, Y said that he would go away for an hour and return. Instead, he negligently absented himself for four hours. After his return an uneventful delivery was effected, with prompt convalescence of the mother. X, joined by her husband, sues Y for mental anguish and apprehension, which, she said, resulted from her terror of an imminent birth during Y's prolonged and unjustifiable absence.

After offering evidence in support of these allegations, plaintiff rests her case, praying for \$5,000 damages. Defendant, Y, files a motion for an instructed verdict.

The court must instruct a verdict for the defendant. The American courts do not permit the recovery of damages for so-called shock or mental anguish

unattended by any actual injury.⁸ Such damages are regarded as too speculative for fair ascertainment. If the dereliction were to be considered a breach of contract, nominal damages (1 cent or 1 dollar) could be ordered entered by the court for the plaintiff, and in some states this would cause court costs to be taxed against the defendant. But the better view, and the one which it is believed the majority of courts would take, is that the contract of employment merely raises the duty of the physician, while its breach is a tort. The law allows nominal damages for breach of contract, without proof of actual damage. In negligence actions, however, since the cause of action is based on the law of torts, the better view denies nominal damages when actual damages are not proved. Verdict in this case should be instructed for the defendant, Y.

I have taken care to put only cases in which the plaintiff fails to recover because of some fatal defect in the proof of his *prima facie* case. There is some lack of one of the "four D's," and if any one is missing, the plaintiff has fallen short and cannot recover. On these the plaintiff has the "burden of proof." The burden of pleading follows the burden of proof; so it is evident that in his petition or declaration, wherein he pleads the "essential facts" of his grievance, the plaintiff must necessarily plead the "four D's." Pleadings are required for the purpose of giving the opposing party notice of one's contentions and fair opportunity to prepare his reply and countering evidence. It is therefore a cardinal rule that a plaintiff cannot prove what he does not plead. Thus, even if a plaintiff has evidence available to prove the "four D's" but has omitted to plead one of them, there is a fatal variance between proof and pleadings.

On proper objection, the court will exclude the proffered testimony on the subjects not pleaded. In such case, plaintiff will prevail only in event he can secure leave to file a "trial amendment" conforming his pleadings to the proposed proof. Whether this will be allowed so late as trial lies strictly within the sound discretion of the trial court. Thus, occasions may arise when the defendant will prevail either because: (1) the plaintiff has evidence available to prove the "four D's" but has failed to plead one or more of them in advance of trial and is impaled on the rule that one cannot prove what he has not pleaded; (2) the plaintiff has adequate pleadings but fails to offer evidence in proof of each of the "four D's," or (3) the plaintiff has adequate pleadings and offers evidence on each of the "four D's," but on one or more it is insufficient to raise an issue of fact for submission to the jury. In each of these cases, by filing a motion for an instructed verdict at the close of the evidence the defendant may win the case in the trial court through failure of the plaintiff to make out his *prima facie* case.

It is hoped that the foregoing analysis is not obscure or overtechnical. It is only in accepting the challenge of the law in action that one can grasp the true nature of the judicial process.

(To be continued)

GLANDULAR PHYSIOLOGY AND THERAPY

THE ADRENOGENITAL SYNDROME

OSKAR WINTERSTEINER, Ph.D.

NEW YORK

This special article is published under the auspices of the Council on Pharmacy and Chemistry. It is one of a series which will be published in book form as the second edition of "Glandular Physiology and Therapy." The opinions expressed in this article are those of the author and do not necessarily represent the views of the Council.—ED.

The advances made in adrenal and sex endocrinology during the past decade have materially broadened and to some extent rationalized our conceptions about the essential nature of the adrenogenital syndrome. In keeping with the general intent of this series, the endocrinologic and biochemical aspects have been preferentially treated in this article, at the expense of the clinical and pathologic features. A brief description of the latter aspects will suffice as a background for the topics more specifically discussed here.¹

The adrenogenital syndrome in the broadest sense of the term comprises all conditions in which the abnormal changes in the sexual sphere are referable to organic or functional disturbances in the adrenal cortex. It is far more frequently seen in females, in whom the changes consist in the appearance of the male secondary sex characteristics and the repression of female characters and function: adrenal virilism. In general, the earlier in life the lesion develops, the more pronounced is the masculinization; hence in very young children, in whom the damage is probably prenatal, the picture is that of pseudohermaphroditism of various degrees, so that there is often some doubt about the true sex. If the onset occurs later in prepubertal life, the masculinization is usually less complete, and may overlap with signs of isosexual precocious maturity (enlargement of clitoris and labia majora, appearance of pubic hair and hirsutism, and sometimes also growth of breasts and appearance of menstruation). It is only natural that in many cases in which the imbalance is of a more latent character the onset of puberty is required to bring the maleness in appearance (contour of body, distribution of hair, failure of breasts to develop) into full prominence. Menstruation remains in abeyance. If the syndrome becomes established after normal puberty, or later in life, hirsutism is usually the first change noted, followed by irregularity or cessation of the menstrual cycle, changes in the body contour and usually mammary atrophy and enlargement of the clitoris.

In males the juvenile form of the syndrome gives rise to precocious sexual maturity with genital enlargement and hirsutism, often associated with rapid increase in stature and muscular development, or with obesity. In adult men the disease is rare, and then the tendency is more frequently toward feminization, with enlargement of the breasts and genital atrophy, than toward increased virility.

8. Contrast this with the English rule. A negligently operated tramcar collided with a hearse carrying a coffin containing a corpse on its way to the cemetery. The hearse was damaged and there was imminent danger that the coffin would be thrown on the pavement. The spectacle caused nervous "shock" to four relatives of the decedent who were following behind in the funeral cortege. The trial court denied recovery, but the Court of King's Bench held that plaintiffs could recover damages. "Nervous shock, if caused by the defendants' negligent act, is just as really damage to the sufferer as a broken limb." (*Owens v. Litterpool Corporation* [108 L. J. K. B. 135, 1939, 1 K. B. 394]).

Besides the changes in the sexual sphere and the acne of the face, back and chest, which is almost invariably present, other less constant features occur with various degrees of frequency. Such are obesity or abnormal distribution of fat, purple striae, hypertension, osteoporosis and frank or latent diabetes. All the latter conditions are also encountered in Cushing's syndrome (basophil adenoma of the pituitary). The original definition of this syndrome lists among its symptoms genital dystrophy and depression of sexual functions but not signs of sex reversal, such as virilism; later, however, it became increasingly clear that no sharp line of demarcation could be drawn between this condition and the adrenogenital syndrome proper. The frequent findings of malignant adrenocortical tumors in cases of either condition add to the difficulty of classification. There has been an increasing tendency in recent years to ascribe the symptoms of Cushing's disease to a primary hyperfunction of the adrenal cortex, while others adhere to the original view, which holds that the fundamental endocrine disturbance is in the pituitary. Whatever interpretation may be correct, there is hardly any doubt that the adrenal cortex is somehow involved in most, if not all, cases of this syndrome. This is probably true also of the "diabetes of bearded women," first described by Achard and Thiers, in which the chief symptoms are hirsutism of the face, irregularity or absence of menstruation, obesity and glycosuria. Since other features of Cushing's disease are frequently present, the condition is now usually regarded as a variation of the latter syndrome.

The condition of the adrenal cortex in the adrenogenital syndrome bears no definite relation to the type and severity of the symptoms. The gland may be grossly normal, slightly or considerably hyperplastic or, more rarely, may be adenomatous or carcinomatous. The reported absence of structural abnormalities, as well as the fact that adrenal hyperplasia is a relatively common finding entirely apart from the syndrome, makes it necessary to assume that the disturbance in these cases arises on a functional rather than on a structural basis. The often confirmed remission of the symptoms after unilateral adrenalectomy when the removed gland was normal in size or only slightly enlarged seems to justify this view. Neither do all neoplasms of the cortex give rise to sexual changes. Among the symptom-producing tumors, malignant carcinoma predominates. This type of tumor is found in cases of juvenile and adult virilism, of isosexual precocity in boys and girls, of feminization in adult males and of Cushing's syndrome. It is clear from this that cortical neoplasms may cause changes in the direction of masculinity as well as of femininity, which has led to the distinction, on purely clinical grounds, between androgenic and estrogenic tumors.

Grollman,^{1a} who has denied the existence of estrogenic tumors, postulated that all masculinizing tumors arise from a special "androgenic" tissue, which is functionally distinct from the rest of the cortex. In fetal and early postnatal life this tissue comprises a part of the reticular zone; later it undergoes involution and then is confined to a thin juxtamedullary layer or merely a few scattered cells in this location. More recently, however, the author seems to have discarded this hypothesis (Gersh and Grollman²) and now attributes virilism either to the inclusion on the cortex of testicular rests which become functional or to a

derangement in steroid metabolism resulting in the formation of androgens. Vines and co-workers^{1c} have attempted to correlate virilism with the presence of histologic elements showing an abnormal (red) staining reaction with the ponceau fuchsin stain. The fuchsinophil material is not confined to any particular cell type, nor to the juxtamedullary zone, and therefore does not seem to bear any relationship to Grollman's androgenic tissue. In the series of Broster and Vines the reaction was positive in normal-sized and hyperplastic adrenals in 34 of 36 cases of virilism. Among the tumors, only those causing masculinizing symptoms gave the reaction. These observations have been confirmed by others, though Cahill³ could find an excess of fuchsinophil material only in carcinoma, and not in adenomatous or non-neoplastic glands.

ENDOCRINE BASIS OF THE ADRENOGENITAL SYNDROME

An interesting theory concerning the influence of the adrenal cortex on sexuality has been developed by Vines and co-workers,^{1c} based chiefly on a study of the fuchsinophil reaction in human fetal adrenals, which cannot be rendered here in detail. In brief, the cortex is conceived as "a potentially bisexual accessory sex gland, largely controlled by the pituitary and capable of secreting simultaneously androgens or estrogens, the one or the other being in excess." In the fetal adrenals of both sexes there occurs an androgenic phase shortly after the differentiation of the gonads and accessory sex organs has been completed. In the female this phase is of much shorter duration than in the male, but it nevertheless "interrupts the continuity of development along female lines and thereby introduces an element of instability," while in the male it serves to reinforce and stabilize the genetic maleness. In the female an overproduction of adrenal androgen during the androgenic phase or a failure of the latter to be terminated by inhibitory influences normally present (pituitary?) may then lead to various degrees of fetal masculinization. If the androgenic factor becomes dominant early in fetal life (before the twentieth week), the female gonad itself, which is then still in a plastic state, may become inverted (pseudohermaphroditism). Adolescent virilism is conceived as resulting from later fetal masculinization, which does not affect the gonad, and remains latent till puberty. Other forms of the syndrome are simply referable to an overproduction of adrenal androgenic or estrogenic factors, with the primary stimulus either residing in the gland itself (tumors) or in the pituitary (Cushing's syndrome).

The fundamental premise of this hypothesis, namely, that the adrenal can elaborate androgens and estrogens, is now well established by chemical research. There is also some reason to believe that this secretion is subject to, if not necessarily regulated by, stimuli from the pituitary. The exact mechanism involved in the pathologic overproduction of these hormones can only be guessed. The existence in the cortex of a special tissue secreting sex hormones which is stimulated to overfunction in disease must be regarded as highly hypothetical. The substances responsible for the symptoms may be formed by some aberration of cortical steroid metabolism; or, since there is evidence that the gland normally gives rise to androgens and perhaps estrogens, the pathologic change may consist merely in an increased rate of production. There are indications that the metabolism of cortical steroids, other

than androgens, is affected in virilism. Indeed, Haymaker and Anderson^{1d} expressed the opinion that Cushing's syndrome differs from the adrenogenital syndrome proper mainly in that overproduction of the cortical hormones acting on electrolyte and carbohydrate metabolism supervenes in the former and that of sex hormones in the latter. In support of this view they quoted their own findings on the presence of a life-maintaining factor in the blood and urine of patients with Cushing's disease,⁴ on serum electrolyte changes in this disease which are opposite to those observed in adrenal cortex insufficiency,⁵ and on the diabetes often associated with the syndrome.

ANDROGENS IN THE ADRENAL CORTEX

In 1936 Reichstein⁶ isolated from beef adrenals an unsaturated triketone, adrenosterone (II), which exhibited androgenic potency in the capon comb test equivalent to one fifth of that of androsterone. More recently a saturated compound, structurally related to adrenosterone, 11-hydroxyisoandrosterone (formula II minus double bond, hydroxyl groups instead of keto groups at C₃ and C₁₁), was also found in the gland.⁷ Its androgenic potency is only one thirtieth of that of androsterone.⁸ Both these compounds have also been prepared in the laboratory by oxidative degradation of certain pregnane derivatives occurring in the adrenal cortex. The formation of adrenosterone from 11-dehydro-17-hydroxycorticosterone (I), a compound possessing weak life maintenance activity, is shown in the formulas below.

The cleavage of the side chain can also be effected, as Mason⁹ has shown, by weak alkali. It is conceivable that similar reactions resulting in the production of androgenic ketones may also occur biologically and that this represents the pathway by which the cortical steroids possessing the requisite groups at C₁₇ and C₂₀ are degraded in the organism. Pregnane compounds of this type, which thus, from the chemical point of view, may be considered as potential precursors of androgens, are relatively abundant among the steroids of the adrenal cortex. It is interesting in this connection that one of these compounds, the 17-hydroxyprogesterone recently isolated by Pfiffner and North,¹⁰ is by itself androgenic, its potency in the rat test equaling that of androsterone. On oxidation it yields Δ_4 -androstenedione, which, a close relative of testosterone, is still more effective in the castrated rat. This suggests that 17-hydroxyprogesterone may owe its androgenic properties to degradation in the treated ani-

mal to androstenedione, although it is of course equally possible that the original molecule may be androgenic as such.

EXCRETION OF SEX HORMONES AND RELATED STEROIDS IN THE ADRENOGENITAL SYNDROME

Androgens.—Owing to the expense and difficulty of the capon comb growth method of assaying urine for androgens, quantitative data on the excretion of these substances are yet too scant to permit satisfactory correlation with the clinical and pathologic observations. The colorimetric method when used, as by Callow,¹¹ with proper caution regarding procedure and interpretation may prove of great value in this respect. There is, however, some agreement on the point that malignant cortical tumors are often associated with inordinately high levels of androgen excretion regardless of the sex of the patient and the type of the symptoms. Of particular interest in this connection is a report by Crooke and Callow¹² on 2 cases of adrenal carcinoma classed as pituitary basophilism (the patients were a 25 year old man and a 6 year old girl); the authors contrasted the relatively enormous amounts of androgen excreted in these cases with the essentially normal amounts in 2 other cases of the syndrome not associated with adrenal tumor. But exceptions undoubtedly occur, as in a case of carcinoma listed by Kenyon and co-workers¹³ in which the figure was not far above the normal range. Moderately elevated or essentially normal values of urinary androgen seem to prevail in cases of adolescent or adult virilism in which there is no evidence of a malignant tumor.¹⁴ In the series of Broster, in which information about the condition of the gland was available through unilateral adrenalectomy, Patterson and Greenwood¹⁵ determined the so-called "free male hormone" (the androgenic substance extractable without previous acid hydrolysis of the urine), because this entity was found to be entirely absent from normal female urine. There was no particular correlation between the amounts of free androgen excreted and the size of the gland or the degree of virilism; however, in almost all cases in which free androgen was present, the gland showed a strong fuchsinophil reaction. The operation effected an immediate reduction of the free androgen in the urine and the virtual disappearance of this substance in later postoperative stages. Similarly, the excessive (total) androgen observed in cases of tumor of the adrenal was seen to decline to lower values after operation.¹²

The androgen content of hyperplastic glands seems to be so low that in most cases it is not demonstrable at all (Patterson and Greenwood¹⁵). Slot¹⁵ found none, and Crooke and Callow¹² only comparatively small quantities of androgen (0.2 to 0.35 international unit per gram of non-necrotic tissue) in tumors which had given rise to excessive amounts in the urine.

Obviously, only an insignificant portion of the androgen produced is stored at the site of origin. This is reminiscent of the situation in normally functioning endocrine glands which produce steroid hormones (testis, ovarian follicle, corpus luteum).

Estrogens.—Abnormally high amounts of estrogen seem to be excreted sometimes in virilism with or without adrenal neoplasm¹⁶ but more often in those cases of adrenal tumor classed as instances of Cushing's syndrome.¹⁷ Frank^{17a,b} considered inordinately high amounts (1,000 to 10,000 mouse units per day) as characteristic for cortical carcinoma, since he did not observe them in cases in which the gland was merely adenomatous or hyperplastic (Frank test). It has to be pointed out, however, that by no means all cases of carcinoma exhibited this feature,¹⁸ so that only a strongly positive test may be regarded as diagnostically significant.

Excretion Products.—The excessive androgen titer of the urine examined chemically by Callow¹⁹ in 2 cases of tumor was shown to be chiefly due to its content of dehydroisoandrosterone (III), which was isolated in extraordinarily high yields (110 and 60 mg. per liter).

This author suggested that the small amounts of this substance excreted by normal men and women have their source likewise in the adrenal. A related compound, $\Delta_{3,5}$ -androstadiene-17-one (IV), accounted roughly for the moderately increased urinary androgen in a case reported by Burrows and co-workers.²⁰ The patient was a man exhibiting symptoms of feminization, caused by a metastasized adrenal tumor. Since the compound was not found in the urine of patients with cancer in other locations, its derivation from the adrenal and not from the testes, which were atrophied, is fairly certain. The estrogen excretion in this case was very high (3,000 international units per liter). The compound concerned was in all probability estrone (theelin). The relative preponderance of the heterosexual hormone in this rare type of sex inversion is of interest.

From the studies of Butler and Marrian²¹ it appears that the excretion of steroids in the syndrome is

qualitatively as well as quantitatively altered from the normal. From the urine of patients with symptoms of virilism, caused by cortical hyperplasia, four steroids were isolated. One of these is a pregnane-3,17,20-triol (V) stereoisomeric with similar triols which occur in the gland itself (Reichstein). The authors definitely established the absence of this triol from the urine of normal men, and of normal and pregnant women; they also showed that it disappeared from the urine of patients after removal of the hyperplastic gland. It is therefore an abnormal excretion product specifically associated with the syndrome and probably derived from the diseased gland. Later another triol of this type, stereoisomeric with the first, was isolated from the pathologic urines; furthermore, two stereoisomers of androsterone, isoandrosterone and 3 α -hydroxyetiocholan-17-one, were present. It should be mentioned that among the four isolated compounds only isoandrosterone is known to be (weakly) androgenic; 3 α -hydroxyetiocholanone, which was later shown to occur also in normal urine,²² is physiologically inactive; and the two pregnanetriols should lack androgenic action for structural and stereochemical reasons.²³

It was also noted by Butler and Marrian^{23a} and by Venning, Weil and Browne²⁴ that their patients with virilism excreted pregnanediol. These patients had primary or secondary amenorrhea; the diol could therefore not have been derived, as in normal cyclic women, from the progesterone secreted by a functional corpus luteum. Since the adrenal cortex is known to elaborate progesterone,²⁵ and since the excretion of pregnanediol ceased after operation,²⁴ there can be little doubt as to the adrenal origin of the compound in these cases.

ADRENAL CORTEX AS A NORMAL SOURCE OF SEX HORMONES

It can now be considered as certain that at least a part of the androgens excreted by normal subjects is derived from an extragonadal source, which as far as present knowledge goes can be only the adrenal cortex. The urine of eunuchs and of ovariectomized women shows small but definite amounts of androgenic activity.²⁶ According to Callow,^{19c} the figures may even overlap the normal range. Hirschmann²⁷ succeeded in identifying, by actual isolation, the androgens excreted by ovariectomized women as androsterone and dehydroisoandrosterone. The stereoisomer of the former, 3 α -hydroxyetiocholan-17-one, which is physiologically inactive, was likewise present. The yields were only little lower than those reported by the Callows when they isolated the same three compounds from the urine of normal women^{22a} and men.^{22b} It would seem from

these results that the contribution of the adrenal to the normal excretion of androgen is much greater than was hitherto suspected.^{27a}

The presence of residual estrogenic activity in the urine of male and female castrates²⁶ invites an analogous interpretation. The possibility that these small quantities may be derived from foodstuffs appears to have been ruled out by Eng.²⁸ The ability of the adrenal cortex to elaborate, if not to secrete, estrogens cannot be doubted, since crystalline estrone (theelin) has been isolated from beef glands.²⁹

The still controversial question whether the adrenal cortex, with its potential faculty to secrete androgens and estrogens, actually plays a part, beside the gonads, in the regulation of normal sex functions must be treated here summarily. Gersh and Grollman² denied any normal "androgenic function" on the ground that the effect of castration on the accessory sex organs of male rats and mice is not modified by the absence of the adrenal, but this has been disputed by Burrill and Greene,³⁰ who contend that the partial maintenance, in early prepubertal life, of the ventral prostate of the young castrated rat is due to an androgenic secretion from the adrenals. A positive response of the accessory organs was also observed by Hodler³¹ in castrated male guinea pigs receiving beef adrenal implants or extracts. Furthermore, Davidson and Moon³² were able to produce significant enlargement of the seminal vesicles and prostates of castrated rats by means of adrenotropic anterior pituitary preparation, which also caused hypertrophy of the adrenal cortices. Since the effect could not be elicited in the absence of the adrenals, it is clear that this gland had been stimulated to secrete an androgenic principle. Similar results have been obtained by Hodler³¹ in male guinea pigs, while in normal and ovariectomized females a masculinizing effect (hypertrophy of the clitoris) was observed. That a secretion of estrogens may be evoked by the same stimulus would appear from the experiments of Moon,³³ who induced vaginal opening and signs of estrus in immature spayed rats by administration of an adrenotropic extract.

It must be conceded that all these results, except perhaps those of Burrill and Greene, reveal a potential availability rather than an active, functional secretion of androgens and estrogens from the adrenal cortex. Further work is needed to clarify this issue. At any rate it would not seem, from the present evidence, that these secretions play an important part functionally in the normal adult organism. The biochemist is perhaps tempted to take the more limited view that they are incidental by-products of cortical steroid metabolism, which, to judge from the number of compounds isolated from the gland (most of which are physiologically inactive), seems to be highly complex and ramified.

27a. This is true also of the androgen excretion in males, since the Callows later demonstrated the presence of the aforementioned compounds in the urine of eunuchs. The level of dehydroisoandrosterone equaled that of normal male urine, while the excretion of the other two steroids was lower than in normal males. The data gives support to Callow's earlier suggestion that dehydroisoandrosterone, at any rate, may be wholly derived from the adrenals. (Callow, H. N., and Callow, R. K.: *Biochem. J.* 34: 276 [March] 1940.)

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

OFFICE OF THE COUNCIL.

KINNEY'S YEAST EXTRACT CONTAINING VITAMIN B COMPLEX (See New and Nonofficial Remedies, 1940, p. 524).

The following dosage form has been accepted:

Kinney's Yeast Extract (Vitamin B Complex) Tablets, 5 grains: Each tablet contains not more than 50 international units of thiamine hydrochloride and not less than 25 Sherman-Bourquin units of riboflavin.

Manufactured by the Scientific Sugars Company, Columbus, Ind.

NICOTINIC ACID AMIDE (See New and Nonofficial Remedies, 1940, p. 526).

The following product has been accepted:

Nicotinic Acid Amide-Upjohn.—A brand of nicotinic acid amide-N. N. R.

Manufactured by the Upjohn Company, Kalamazoo, Mich. No U. S. patent or trademark.

Tablets Nicotinic Acid Amide-Upjohn, 50 mg.

SODIUM CITRATE 2½% W/V IN PHYSIOLOGICAL SOLUTION OF SODIUM CHLORIDE IN CENTRI-VAC CONTAINER-BAXTER.—A sterile 2.5 per cent solution of sodium citrate in physiological solution of sodium chloride contained under reduced pressure of approximately 8 cm. of mercury in a specially adapted bottle which can be equipped with a special valve to regulate the inflow of liquids.

Actions and Uses.—An anticoagulant in a special container for the separation of plasma from whole blood by centrifugation or sedimentation and for the indirect transfusion of citrated whole blood. After aspiration of blood from the donor's vein to the container, it is mixed with the citrate and the cells are allowed to separate for the preparation of plasma. The container is also suitable for the indirect transfusion of the citrated blood. The plasma is transferred to another container for dilution, storage and administration.

Dosage.—35 cc. of the solution is used for each 250 cc. of whole blood.

Manufactured by Baxter Laboratories, Inc., Glenview, Ill. (American Hospital Supply Corporation, Chicago, distributor.) Produced and distributed in eleven Western states by Don Baxter, Inc., Glendale, Calif. U. S. patent 2,108,583.

Sodium Citrate 2½% W/V in Physiological Solution of Sodium Chloride in Centri-Vac Container-Baxter, 15 cc. in 300 cc. Bottle: Contains 2.5 per cent sodium citrate in physiological solution of sodium chloride.

Sodium Citrate 2½% W/V in Physiological Solution of Sodium Chloride in Centri-Vac Container-Baxter, 35 cc. in 300 cc. Bottle: Contains 2.5 per cent sodium citrate in physiological solution of sodium chloride.

PHYSIOLOGICAL SOLUTION OF SODIUM CHLORIDE (See New and Nonofficial Remedies, 1940, p. 379).

The following product has been accepted:

PHYSIOLOGICAL SOLUTION OF SODIUM CHLORIDE IN PLASMA-VAC CONTAINER-BAXTER.—A sterile isotonic solution of sodium chloride contained under reduced pressure of approximately 12 cm. or 30 cm. of mercury in specially adapted bottles which can be equipped with a special valve to regulate the inflow of liquids.

Actions and Uses.—The solution is used as a diluent in a special container for the aspiration, storage and administration of blood plasma obtained by centrifugation or sedimentation of citrated whole blood.

Dosage.—Two hundred and fifty cc. of the solution is used to dilute 250 cc. of plasma.

Manufactured by Baxter Laboratories, Inc. (American Hospital Supply Corporation, Chicago, distributor.) Produced and distributed in eleven Western states by Don Baxter, Inc., Glendale, Calif. U. S. patent 2,108,553.

Physiological Solution of Sodium Chloride-Baxter, 250 cc. in 500 cc. container.

THIAMINE HYDROCHLORIDE (See New and Nonofficial Remedies, 1940, p. 528).

The following dosage forms have been accepted:

Mead's Thiamine Hydrochloride Tablets, 0.75 mg. Prepared by Mead Johnson and Co., Evansville, Ind.

Mead's Thiamine Hydrochloride Tablets, 3 mg. Prepared by Mead Johnson and Co., Evansville, Ind.

SATURDAY, JUNE 14, 1941

THE CLEVELAND SESSION

An inundation of physicians beyond the capacity of the available hotels in Cleveland marked the annual session of the American Medical Association for 1941. The attendance was 7,269, more than twelve hundred above the attendance in the same city in 1934. Even the use of a boat with a tremendous capacity moored on the lake front failed to satisfy the desire for accommodations. The problem of selecting a place for the annual session that is capable of providing sufficient hotel rooms to meet the desire of American physicians who attend the annual sessions of the American Medical Association is one which now taxes the resources of our great cities. There is obvious need in the United States for some of our largest metropolitan centers to provide auditoriums such as those available in Atlantic City, and there is also need for the smaller communities which have such large auditoriums to make available sufficient hotel space to accommodate the numbers who now attend many large conventions.

Conspicuous in the Cleveland session were the exhibits. The unanimous encomiums by physicians who spent many hours in attendance on both the scientific and the technical exhibits are proof of the tremendous value attached to these features. Invariably the doctors said that the scientific exhibits offered the greatest concentrated postgraduate education in medicine made available anywhere in this or any other country. The scope of the exhibits, the perfection of organization, the attractiveness of the displays and the earnestness of the physicians who demonstrated were, no doubt, largely responsible for the enthusiasm. Since the time when Drs. Frank Wynn and Frank Billings first gave their personal attention to this development there has been steady progress toward the practical perfection now achieved.

The scientific sessions merit particular mention. The new Section on Anesthesiology justified its existence with attendance varying between one hundred and fifty

and two hundred and with an excellent program. The general scientific meetings included the clinical session, which was received with approbation, a special session on infantile paralysis in which the National Foundation for Infantile Paralysis cooperated, and a meeting on medical preparedness in which all the official agencies of the government and other agencies were well represented. In many of the sections the traditional scientific contributions were varied by panel discussions, round tables and similar meetings, indicating that the Council on Scientific Assembly and the officers of the sections are alert to the adoption of new technics in medical teaching.

The problems which confronted the House of Delegates were largely military, social and economic, but there were also evidences of concern of the House with problems of scientific advancement. The medical profession is ready, through the work of the Committee on Medical Preparedness, to meet the needs of the government and of civilian agencies for medical service. Obviously, as the House recommended, some central assignment authority must be developed, having available a full knowledge of the medical resources of the country, to distribute medical personnel to meet all the various needs. Continuity of medical education is absolutely essential to maintenance of an adequate supply of physicians for all these purposes. Largely discussed also was the situation now created by the certifying boards in the specialties and by some of the activities of the Advisory Board created by these certifying boards. The resolutions on this subject and the discussion associated with their presentation and consideration indicated how essential is thorough consideration before taking further action in this field. Indeed, the Council on Medical Education and Hospitals of the Association was specifically requested by the House of Delegates to manifest leadership in aiding the work of these certifying boards so that they function primarily for the good of the people and for the advancement of medical science and avoid the tendency toward the establishment of guilds which in some instances seems to prevail. The various resolutions offered on this subject will be published as part of the proceedings of the annual session, which begin in this issue of THE JOURNAL.

Especially significant was the action taken by the House of Delegates to establish a Committee on Pan American Relationships, which is to be concerned with the establishment of scientific interchange with the medical societies of our South American, Mexican, Cuban, Puerto Rican and Canadian colleagues. The annual session for 1942, to be held in Atlantic City, has been announced as a Pan American session to which distinguished representatives of the other American nations

will be asked to send representatives, exhibits and, indeed, to participate as much as possible. The Council on Scientific Assembly is charged by the Association with the development of the scientific aspects of this session.

Noteworthy among the social functions of the 1941 session were the opening general meeting, which was held in the Music Hall under perfect conditions and which included addresses by distinguished clergymen, the governor of Ohio, the mayor of Cleveland and the officials of the Association, and the President's reception in the Hotel Cleveland, largely attended and with ideal arrangements for this delightful function, and the golf tournament, with the largest registration in its history. The dinners given to the Board of Trustees and the House of Delegates by the Ohio State Medical Association and the Cleveland Academy of Medicine were on a dignified plane, again perfectly arranged with the provision of delightful entertainment and exceptional cuisine.

The House of Delegates voted in executive session without a dissenting vote to carry onward the trial of the case of the United States government versus the American Medical Association et al., so that a decision may be had from the highest courts as to the place which organized scientific medicine is to occupy in our economy. The unity of the action taken, the careful consideration given to every problem presented, the insight into the affairs of medical practice in the United States testified to the extraordinarily high character of the representation in the House of Delegates, the body which is charged by the American Medical Association with the establishment of its policies.

The 1941 session witnessed the end of the term of service of Dr. Thomas Cullen as a member of the Board of Trustees, a service which he has rendered as a contribution to the advancement of medicine for the past twelve years. In his place comes Dr. Charles W. Roberts of Atlanta, Ga., for some time a member of the House of Delegates and of the Council on Industrial Health. The death of Dr. Fred Moore and the election of Dr. Fred Rankin to the presidency brought about two vacancies on the Council on Medical Education and Hospitals. For these positions the Board of Trustees nominated several distinguished physicians, from whom the House of Delegates elected Drs. Harvey B. Stone of Baltimore and Russell Haden of Cleveland. In the development of American medical practice this Council's part is now so vital that these additions to the membership are considered especially fortunate.

Thus passed the annual session of 1941—a credit to the Local Committee on Arrangements and to the city in which it was held; a credit to the official bodies of the Association who were charged with the creation of the exhibits and the handling of its affairs; a credit, indeed, to all who participated.

PROFESSIONAL TESTIMONIALS [?]

The Bureau of Investigation of the American Medical Association has always contended that testimonials, whether of doctors or of laymen, are of little scientific value. Frequently a monetary exchange influences a testimonial, in its opinion.

An orthopedic surgeon in Chicago recently received a letter on the stationery of the Scholl Manufacturing Company of Chicago which reads:

"Dear Sir: It is our intention to make a clinical investigation of some of our foot preparations and we would like to know if you are willing to do this work for us.

"Due to your wide experience in this field, we would greatly appreciate getting affidavits from you and learning your fee for these medical reports.

"These affidavits should contain the extent of your investigations and a sanction in regard to our claims, as well as the effectiveness of these products.

"If you do decide to make this clinical investigation, will you please drop a note to Dr. Einstoss, so that an appointment can be arranged for a time that will be mutually agreeable."

Apparently the Scholl Manufacturing Company fails to recognize that statements obtained in this manner do not constitute acceptable scientific evidence on which to devise claims for products.

Perhaps there is no relationship between the request and the statement issued on Dec. 8, 1940 by the Federal Trade Commission:

"Scholl Manufacturing Company, Inc., 211 West Schiller St., Chicago, engaged in the manufacture and distribution of devices known as 'Dr. Scholl's Zino-Pads' and 'Dr. Scholl's Kurotex Foot Plasters,' designed for the treatment of corns, bunions and other foot ailments, has been ordered by the Federal Trade Commission to cease and desist from certain misrepresentations of the products.

"The respondent is ordered to cease and desist from disseminating or causing to be disseminated any advertisement in commerce which represents, directly or through inference, that the use of 'Dr. Scholl's Zino-Pads' stops pain instantly or in one minute; that corns or callouses can be lifted out after the application of 'Dr. Scholl's Zino-Pads' without the use of surgery or other aids; that the use of 'Dr. Scholl's Zino-Pads' is a cure or remedy for corns, callouses or bunions; that 'Dr. Scholl's Zino-Pads' have healing properties; or that the use of 'Kurotex Foot Plasters' instantly relieves the pain caused by corns, sore toes, callouses, bunions or tender spots on the feet caused by new or tight shoes, or gives any degree of relief from such condition in excess of that which follows from the protection from outside pressure and friction, or gives any relief from such conditions except during the time that the 'Kurotex Foot Plasters' are worn."

Current Comment

FOURTH OF JULY FIREWORKS INJURIES

This year, as in the previous four years, the American Medical Association is circularizing hospitals, dispensaries and other institutions in the United States with a view to compiling a record of the deaths and injuries resulting from celebration of the Fourth of July with fireworks. As the result in large part of these annual summaries, several states have adopted effective anti-fireworks legislation. The number of deaths from this cause has been reduced therefore in 1940 to 8 as compared with 20 in 1937. The total number of injuries has been reduced from 7,205 in 1937 to 4,462 in 1940. Although the improvement is considerable, it is still obvious that there can be no relaxation of effort in the attempt to prevent such unnecessary accidents. Hospitals throughout the country are again asked to cooperate in the careful filling out and prompt return of the questionnaires which they will shortly receive in order that a still further improvement in the situation may be brought about.

FRED WHARTON RANKIN— PRESIDENT-ELECT

Again a surgeon of international repute has been elected by the House of Delegates of the American Medical Association to the highest honor in the province of scientific medicine. Again the House of Delegates recognized service to organized medicine: the physician selected is one who has participated notably in the affairs of the American Medical Association and of many other scientific bodies. Dr. Rankin was born in Mooresville, N. C., on Dec. 20, 1886. After receiving his bachelor of arts degree from Davidson College in 1905 he received his degree of doctor of medicine from the University of Maryland in 1909 and the degree of master of arts from St. John's College in 1913. He was also made honorary doctor of sciences by Davidson College, his alma mater, in 1937, and honorary LL.D. by the University of Maryland in 1939. Following his graduation in medicine he became a resident surgeon at the University Hospital in Baltimore from 1909 to 1912 and served as assistant demonstrator of anatomy and associate in surgery at the University of Maryland Medical School from 1913 to 1916. He then joined the Mayo Clinic in Rochester, Minn., acting as assistant surgeon at St. Mary's Hospital, 1916-1923. He was professor of surgery at the University of Louisville, 1922-1923, and served as surgeon to the Mayo Clinic and as associate professor at the University of Minnesota Medical School, Mayo Foundation, 1926-1933. He then removed to Lexington, Ky., where he became surgeon to St. Joseph's and the Good Samaritan hospitals, with which he has been associated since Jan. 1, 1934. In the World War Dr. Rankin served as a major in the Medical Corps for seventeen months and was attached to the First Army Corps, 4th and 26th divisions in France, as commanding officer of Base Hospital No. 26. He is now a colonel in the Medical Reserve Corps. He has been honored by many medical organizations, including the presidency of the Southern Surgical Association and the Southeastern Surgical Congress. He is a fellow of the American College of Surgeons and a member of the American Surgical Association, American Proctologic Society, Eastern and Western Surgical associations, Southern Medical Association and many surgical clubs and medical fraternities. He was one of the founder members of the American Board of Surgery, representing in that body

FRED W. RANKIN, M.D.
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

the Section on Surgery of the American Medical Association. His contributions to medical literature include a monograph on "Surgery of the Colon"; a work on "The Colon, Rectum and Anus," published in 1932 jointly with Drs. J. A. Bargen and L. A. Buie, and a work on "Cancer of the Colon and Rectum," published with Dr. A. S. Graham in 1939. He has also contributed chapters on surgery of the colon, with particular reference to carcinoma, in several systems of surgery. In the American Medical Association Dr. Rankin has been especially active. He was a member of the House of Delegates, representing the Section on Surgery from 1935 through 1940. On several occasions he has aided in the work of the reference committees.

In 1936 he was appointed to the membership of the Council on Medical Education and Hospitals, and he has been active in the work of that body. He was appointed by the speaker of the House of Delegates a member of the Committee on Medical Preparedness in 1940 and has been assiduous in the duties of that committee and especially in military preparedness in the Fifth Corps Area. In 1923 Dr. Fred W. Rankin married Miss Edith Mayo, a daughter of Dr. Charles H. Mayo, and he has four children: Frederic Wharton, Edith Graham, Charles Mayo and Thomas Alexander. Almost immediately following his election he was deluged with invitations to attend many meetings of state and other medical

organizations, indicating not only his popularity with the medical profession but his devotion to the work of organized medicine.

THE DISTINGUISHED SERVICE MEDAL

To the distinguished names of Rudolph Matas, surgeon, James B. Herrick, internist, and Chevalier Jackson, otolaryngologist, the House of Delegates added that of Dr. James Ewing of New York, world famed as a pathologist, as the recipient of the Distinguished Service Award of the American Medical Association for 1941. Although 74 years of age, Dr. Ewing came at once from New York to be present on the platform at the opening session to receive the Distinguished Service Medal in person. To repeat the record of his career is almost unnecessary, since he is widely known on several continents. Dr. James Ewing was born in Pittsburgh on Christmas day, 1866. He received his bachelor's degree from Amherst in 1888 and his master of arts degree in 1891. Following his funda-

mental education, he attended the College of Physicians and Surgeons of New York, now known as Columbia University College of Physicians and Surgeons, and received his degree of doctor of medicine in 1891. He has also been honored with honorary degrees of doctor of science by the University of Pittsburgh in 1911, by Amherst in 1923, by the University of Rochester in 1932 and by Union College in 1938 and with the LL.D. degree by Kenyon College in 1931 and by Western Reserve University in the same year. Early in his medical career Dr. James Ewing determined to devote himself to the fundamental sciences. He was a tutor in histology, 1893-1897, and had the Clark fellowship, 1896-1899. He then became instructor in

College, Dr. Ewing was honored with a dinner and with a testimonial volume including fifty-four articles on cancer written by authorities from all over the world. On that occasion messages were sent by President Hoover, Gov. Franklin Delano Roosevelt and Madame Curie, as well as many others. In 1936 he received the John Scott Award, consisting of a bronze medal and \$1,000, from the Philadelphia Board of City Trusts for his research in classifying tumors. He was appointed in 1937 a member of the National Advisory Cancer Council, and he has been a member of many other committees in this field. In 1940 he received the Clement Cleveland Medal of the New York City Cancer Committee. His literary contributions include

FRANK H. LAHEY, M.D., PRESIDENT OF THE AMERICAN MEDICAL ASSOCIATION, PRESENTING
THE DISTINGUISHED SERVICE MEDAL TO JAMES EWING, M.D.

clinical pathology at the Columbia College of Physicians and Surgeons, 1897-1898; he was professor of pathology, from 1899-1932, at Cornell University Medical College and since 1932 has been professor of oncology. Indeed it is his fundamental work in the field of cancer that has made him most famous. Among other positions which he has occupied are the directorship of the Memorial Hospital in New York City. He is a member of such scientific organizations as the National Academy of Sciences, the Association of American Physicians, the American Roentgen Ray Society, the American Association of Pathologists and Bacteriologists, the Society of Experimental Biology and Medicine, the Harvey Society, the American Association for Cancer Research and the American Medical Museum Society. In 1931, when he was head of the department of pathology at Cornell University Medical

“Clinical Pathology of the Blood,” published in 1900; his textbook on legal medicine published in 1910, and his work on “Neoplastic Diseases,” first published in 1919. His writings include also innumerable contributions to systems of medicine and to scientific periodicals. As he received the medal from the hands of President Frank Lahey, Dr. Ewing paid a tribute to organized medicine, complimenting the American Medical Association on its devotion to scientific advancement and pointing out that during his fifty years of membership in the medical profession he had observed a continued advancement, so that American medicine occupies today a position of recognized leadership in the scientific medicine of the world. Dr. Ewing stated also that it was his belief that this position of leadership was a result of the inspiration and freedom of action associated with a truly democratic system of government.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

BARCOMB, Albert E., Lieut., M. R. C., Rochester, N. Y., Camp Forrest, Tenn.
BURNES, Sidney H., 1st Lieut., West Hartford, Conn., Manchester, N. H.
CARROLL, Francis B., 1st Lieut., Great Barrington, Mass., Fort Devens, Mass.
CHESTER, Lewis, 1st Lieut., New Britain, Conn., Hartford, Conn.
CROSKERY, William F., 1st Lieut., Milton, Mass., Hartford, Conn.
CUTLER, Isadore L., 1st Lieut., Rutland, Mass., Fort Devens, Mass.
DURHAM, Richard A., 1st Lieut., Ipswich, Mass., Fort Devens, Mass.
DURLACHER, Stanley H., Lieut., M. R. C., New Haven, Conn., Camp Forrest, Tenn.
DYE, William J. P., 1st Lieut., Wolfeboro, N. H., Manchester, N. H.
EASTMAN, Oliver R., Lieut., M. R. C., Burlington, Vt., Camp Forrest, Tenn.
FAGAN, Frederick J., 1st Lieut., Boston, Maxwell Field, Ala.
FAILLA, Samuel D., 1st Lieut., Greenfield, Mass., Maxwell Field, Ala.
FINEBERG, Meyer H., Major, Boston, Fort Devens, Mass.
FISHBEIN, Jay N., 1st Lieut., Providence, R. I., Maxwell Field, Ala.
FOSTER, Clarence B., 1st Lieut., Greensboro, Vt., Fort McClellan, Ala.
GARIPAY, Stanley L., 1st Lieut., Hartford, Vt., Manchester, N. H.
GELLER, Philip S., 1st Lieut., Newport, R. I., Hartford, Conn.
GOODALL, Edwin B., Lieut., M. R. C., Newton Centre, Mass., Camp Forrest, Tenn.
GURALNICK, Eugene A., Lieut., M. R. C., Roxbury, Mass., Camp Forrest, Tenn.
HADLER, Arthur J., 1st Lieut., Boston, Camp Edwards, Mass.
HAGOPIAN, Peter B., 1st Lieut., Danvers, Mass., Fort Devens, Mass.
HAJJAR, Solomon G., 1st Lieut., North Billerica, Mass., Fort Devens, Mass.
HANSELL, Howard R., 1st Lieut., Sharon, Conn., Fort Devens, Mass.
HARRIS, Max, 1st Lieut., St. Albans, Vt., Fort Devens, Mass.
HILL, Edwin V., 1st Lieut., Lexington, Mass., Fort Barrancas, Fla.
HOLMES, Everett B., 1st Lieut., Ludlow, Vt., Fort Devens, Mass.
HORTON, William H., 1st Lieut., Fall River, Mass., Hartford, Conn.
JOSEPHS, William W., 1st Lieut., New Haven, Conn., Fort Devens, Mass.
KANSKI, Francis A., 1st Lieut., Springfield, Mass., Camp Edwards, Mass.
KEMBLE, Robert P., Captain, Worcester, Mass., Camp Edwards, Mass.
KNOX, Barron D., Lieut., M. R. C., Holyoke, Mass., Camp Forrest, Tenn.

SECOND CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Second Corps Area, which comprises the states of New York, New Jersey and Delaware:

ALFORD, Kenneth M., 1st Lieut., Buffalo, Fort Niagara, N. Y.
AURINGER, Horace E., Major, Addison, N. Y., Fort Ontario, N. Y.
BLEICH, Lamoyne C., 1st Lieut., Buffalo, Fort Bragg, N. C.
BLOCK, Richard M., 1st Lieut., Kenmore, N. Y., Fort Bragg, N. C.
BRIGGS, Bernard D., 1st Lieut., McGraw, N. Y., Fort Bragg, N. C.
CARPENTER, Walter, 1st Lieut., New York, Fort Jay, N. Y.
CHASSY, Gilbert H., 1st Lieut., Bronx, N. Y., Fort Jackson, S. C.
CILIBERTI, Benjamin Joseph, 1st Lieut., Yonkers, N. Y., Fort DuPont, Del.
CITRON, Adolph E., 1st Lieut., Baldwin, L. I., N. Y., Fort DuPont, Del.
COLEMAN, Joseph A., 1st Lieut., New York, Fort Hancock, N. J.
COLMER, Malcolm L., 1st Lieut., New York, Fort Dix, N. J.
CORPOLA, Andrew R., 1st Lieut., Brooklyn, Fort Benning, Ga.
CORBETT, Austin J., 1st Lieut., New York, Fort Benning, Ga.
CORCORAN, William R., 1st Lieut., Binghamton, N. Y., Fort Jay, N. Y.
COWEN, Louis, 1st Lieut., Brooklyn, Fort Hamilton, N. Y.
CULVER, Wesley Y., 1st Lieut., Long Island, N. Y., Fort DuPont, Del.
DAVERSA, Generoso, 1st Lieut., Brooklyn, Fort Jackson, S. C.
DEBADIO, Anthony J., 1st Lieut., Bronx, N. Y., Mitchell Field, N. Y.
DORBIN, Milton C., 1st Lieut., Ventnor, N. J., Fort Bragg, N. C.
DOLCE, Joseph R., Captain, Buffalo, Fort Niagara, N. Y.
D'ONOFIO, Gregory, Captain, Brooklyn, Plattsburg Barracks, N. Y.
DURANTE, Michael H., 1st Lieut., Rochester, N. Y., Fort Ontario, N. Y.

KOUFMAN, William B., 1st Lieut., New Haven, Conn., Hartford, Conn.
LEVIN, Julius R., 1st Lieut., Burlington, Vt., Camp Edwards, Mass.
LEVINSON, Samuel S., 1st Lieut., Malden, Mass., Camp Shelby, Miss.
LEWIS, Henry R., Lieut., M. R. C., Wethersfield, Conn., Camp Forrest, Tenn.
LEWIS, Samuel D., 1st Lieut., Hartford, Conn., Camp Claiborne, La.
LISBON, Wallace, 1st Lieut., Providence, R. I., Camp Edwards, Mass.
McVETTY, Rufus H., 1st Lieut., North Stratford, N. H., Maxwell Field, Ala.
MALONEY, John D., 1st Lieut., Waverley, Mass., Camp Edwards, Mass.
MARDER, Samuel H., 1st Lieut., Westboro, Mass., Maxwell Field, Ala.
MILLER, Himon, 1st Lieut., Providence, R. I., Providence, R. I.
MOORE, Kenneth T., 1st Lieut., Providence, R. I., Fort Bragg, N. C.
NATHAN, Edward M., 1st Lieut., Quincy, Mass., Maxwell Field, Ala.
NORTON, Thomas J., Captain, Pittsfield, Mass., Hartford, Conn.
OTIS, Carlos G., 1st Lieut., Townsend, Vt., Camp Claiborne, La.
PALMER, Edwin J., Captain, M. R. C., Palmer, Mass., Camp Forrest, Tenn.
POWERS, Michael F., Lieut., M. R. C., Belows Falls, Vt., Fort Oglethorpe, Ga.
RICCIO, Joseph S., 1st Lieut., Hamden, Conn., Maxwell Field, Ala.
SANDS, Sidney L., Lieut., M. R. C., Worcester, Mass., Camp Forrest, Tenn.
SEGAL, Leo, Lieut., M. R. C., North Troy, Vt., Fort Oglethorpe, Ga.
SHANNON, Edward T., 1st Lieut., Fall River, Mass., Camp Edwards, Mass.
SHERWIN, Herbert, Captain, Cambridge, Mass., Maxwell Field, Ala.
SMITH, Gordon B., Lieut., M. R. C., Rutland, Vt., Camp Forrest, Tenn.
SPIEGEL, Charles M., Lieut., M. R. C., New Haven, Conn., Camp Forrest, Tenn.
SWEET, Gustaf, 1st Lieut., Providence, R. I., Camp Edwards, Mass.
THORNE, Lewis, Lieut., M. R. C., New Haven, Conn., Fort Rodman, Mass.
VERNON, Sidney, Lieut., M. R. C., Willimantic, Conn., Camp Forrest, Tenn.
WEISMAN, Jacob I., 1st Lieut., Springfield, Mass., Camp Edwards, Mass.
WEISS, Louis R., 1st Lieut., Brookline, Mass., Fort Oglethorpe, Ga.
YOUNG, Leo A., 1st Lieut., Fitchburg, Mass., Camp Wheeler, Ga.

Orders Revoked

ABODEELY, Robert A., 1st Lieut., Worcester, Mass.
BELLIOU, Joseph L., Lieut.-Col., Providence, R. I.
FAY, Thomas F., 1st Lieut., Augusta, Me.
FIELD, Eugene A., 1st Lieut., Providence, R. I.
HASCALL, Theodore C., Major, Riverside, R. I.
MAINVILLE, Albert L., Captain, Leominster, Mass.
MATTERA, Vincent J., 1st Lieut., Providence, R. I.

FINCH, Charles S., Jr., 1st Lieut., Jamaica, L. I., N. Y., Camp Livingston, La.
FLAHERTY, Morton H., 1st Lieut., White Plains, N. Y., Fort Hancock, N. J.
FRIEDMAN, Eliot M., 1st Lieut., Utica, N. Y., Fort Ontario, N. Y.
GANNON, John R., 1st Lieut., Pelham, N. Y., Fort Hancock, N. J.
GAYDOS, Albert L., 1st Lieut., Brooklyn, Fort Wadsworth, N. Y.
GLASSMAN, Herman, 1st Lieut., Brooklyn, Fort Bragg, N. C.
GLICK, Bernard, Captain, Brooklyn, Camp Claiborne, La.
GREELEY, Horace, Jr., 1st Lieut., Brooklyn, Fort Dix, N. J.
GRENEY, Philip, 1st Lieut., Brooklyn, Fort Niagara, N. Y.
GRILLIAS, Morris, 1st Lieut., Brooklyn, Camp Blanding, Fla.
GROSS, Joseph M., 1st Lieut., Brooklyn, Fort Bragg, N. C.
GUTKIN, Morton L., 1st Lieut., Brooklyn, Fort Niagara, N. Y.
HALPERIN, Barnett, 1st Lieut., Brooklyn, Fort Bragg, N. C.
HARRIS, William L., 1st Lieut., Kings Park, L. I., N. Y., Fort Benning, Ga.
HARTMANN, Alfred A., 1st Lieut., Malone, N. Y., Plattsburg Barracks, N. Y.
HARTMANN, Edmund M., 1st Lieut., Jamaica, L. I., N. Y., Fort Benning, Ga.
HARWOOD, Mark R., 1st Lieut., Dexter, N. Y., Madison Barracks, N. Y.
HUBBARD, Oscar E., 1st Lieut., Buffalo, Fort Bragg, N. C.
JAGODA, Leonard S., 1st Lieut., New York, Fort Jackson, S. C.
JOSEPHSON, Frederick, 1st Lieut., Flushing, L. I., N. Y., Fort Hamilton, N. Y.
KAPLAN, Eugene S., 1st Lieut., Brooklyn, Camp Livingston, La.
KAPLAN, Jack A., 1st Lieut., Jersey City, N. J., Fort Bragg, N. C.
KAPLAN, Samuel D., 1st Lieut., Hillside, N. J., Fort Bragg, N. C.

KAUFMAN, Robert E., 1st Lieut., New York, Fort Benning, Ga.
KELLEHER, Dennis A., 1st Lieut., Brooklyn, Fort Monmouth, N. J.
KINDER, Frederick, 1st Lieut., New York, Camp Forest, Tenn.
KLEINFELD, Morris, 1st Lieut., Brooklyn, Pine Camp, N. Y.
KRON, William L., 1st Lieut., Brooklyn, Induction Station, Buffalo.
LANG, Sydney L., 1st Lieut., Staten Island, N. Y., Fort Monmouth, N. J.
LARKIN, Edward A., 1st Lieut., Amenia, N. Y., Fort DuPont, Del.
LEIBOWITZ, Harry, Captain, Brooklyn, N. Y., Camp Livingston, La.
LEVENSTEIN, Louis S., 1st Lieut., Bronx, N. Y., Camp Livingston, La.
LEWIS, Fredric, 1st Lieut., New York, Plattsburg Barracks, N. Y.
LIEBERMAN, Leo A., Captain, New York, Fort Bragg, N. C.
LOCASCIO, Nicholas R., Captain, Bronx, N. Y., Fort Hancock, N. J.
LORENZO, James V., 1st Lieut., Brooklyn, Camp Claiborne, La.
MCARTHUR, John J., 1st Lieut., Elmhurst, L. I., N. Y., Pine Camp, N. Y.
MCKNIGHT, William K., Captain, White Plains, N. Y., Camp Upton, N. Y.
MAILLARD, Leslie W., 1st Lieut., Flushing, L. I., N. Y., Fort Wadsworth, N. Y.
MALINS, Maurice L., 1st Lieut., New York, Madison Barracks, N. Y.
MASCALI, Angelo, 1st Lieut., Bronx, N. Y., Fort Bragg, N. C.
MASTELONE, Aniello F., 1st Lieut., New York, Fort Bragg, N. C.
MELLOW, Joseph A., 1st Lieut., New York, Fort Dix, N. J.
MESSINGER, Emanuel, 1st Lieut., Jamaica, L. I., N. Y., Induction Station, Fort Jay, N. Y.
MILLS, Clifford W., 1st Lieut., New York, Camp Croft, S. C.
MORRONE, Francis X., 1st Lieut., Yonkers, N. Y., Fort Bragg, N. C.
MULHOLLAND, Herbert, 1st Lieut., Far Rockaway, N. Y., Pine Camp, N. Y.
MULLAN, Hugh, 1st Lieut., Stapleton, S. I., N. Y., Fort Benning, Ga.
NEICHIN, Sudney N., 1st Lieut., Brooklyn, Fort Monmouth, N. J.
NUESKE, Frederick W., 1st Lieut., Freeport, L. I., N. Y., Fort Bragg, N. C.
OESTREICH, Mitchell, 1st Lieut., Brooklyn, Fort Hancock, N. J.
PARK, Charles L., 1st Lieut., Yonkers, N. Y., Fort Bragg, N. C.
PLOTKIN, Jacob B., Major, Brooklyn, Fort Dix, N. J.
PORT, Murray, 1st Lieut., New York, Camp Livingston, La.
PRESTON, William O., Captain, New York, Camp Blanding, Fla.
PRINCE, Arthur, Captain, Tuckahoe, N. Y., Fort DuPont, Del.
PSAKI, Constantine G., Captain, Forrest Hills, N. Y., Induction Station, Buffalo.
RAPPA, James E., 1st Lieut., Brooklyn, Fort Benning, Ga.
REISER, Paul, 1st Lieut., New York, Fort Bragg, N. C.
ROBINSON, Arthur, 1st Lieut., New York, Fort Bragg, N. C.
ROCK, Roger J., 1st Lieut., Brooklyn, Fort Bragg, N. C.
ROTHMAN, Albert, 1st Lieut., Syracuse, N. Y., Fort Niagara, N. Y.
RUBENFELD, Sidney, 1st Lieut., New York, Fort Hancock, N. J.
RUBIN, Abraham, 1st Lieut., Brooklyn, Fort Jackson, S. C.
SAFRAN, Nathaniel, 1st Lieut., Flushing, L. I., N. Y., Fort Slocum, N. Y.

FOURTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fourth Corps Area, which comprises the states of Tennessee, North Carolina, South Carolina, Alabama, Georgia, Mississippi, Florida and Louisiana:

CARDWELL, Edward S., Jr., 1st Lieut., Memphis, Tenn., Fort Jackson, S. C.
CARITHERS, Hugh A., Jr., 1st Lieut., Winder, Ga., Fort Bragg, N. C.
CHAPMAN, Charles Granger, 1st Lieut., Columbia, S. C., Camp Livingston, La.
CORRELL, William C., 1st Lieut., Memphis, Tenn., Camp Polk, La.
FERBER, Leon, 1st Lieut., Nashville, Tenn., Camp Claiborne, La.
FRANCIS, John Joseph, 1st Lieut., New Orleans, Camp Claiborne, La.
GOWER, Orien Thomas, Jr., 1st Lieut., Cordele, Ga., Camp Grant, Ill.
HENRY, Jennings L., 1st Lieut., Atlanta, Ga., Camp Davis, N. C.
HENRY, John Arnold, 1st Lieut., Atlanta, Ga., Camp Blanding, Fla.
JORDAN, William K., 1st Lieut., Milledgeville, Ga., Camp Davis, N. C.
KRON, John Louis, Jr., 1st Lieut., New Orleans, Camp Davis, N. C.
LAW, Edward H., Jr., 1st Lieut., Columbia, S. C., Camp Claiborne, La.
MCCULLOUGH, George C., 1st Lieut., Birmingham, Ala., Camp Shelby, Miss.
NEIGHBORS, Joseph B., Jr., 1st Lieut., Macon, Ga., Camp Blanding, Fla.
OVERSTREET, Ralph M., Jr., 1st Lieut., Miami, Fla., Camp Stewart, Ga.
PUGH, William W., Jr., 1st Lieut., Napoleonville, La., Camp Polk, La.
ROUGELOT, Robert Emile, 1st Lieut., New Orleans, Fort Oglethorpe, Ga.

SIXTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Sixth Corps Area, which comprises the states of Wisconsin, Illinois and Michigan:

AGIN, Lambert J., 1st Lieut., Detroit, Selfridge Field, Mount Clemens, Mich.
ALEXANDER, Martin M., 1st Lieut., Detroit, Selfridge Field, Mount Clemens, Mich.
BARKETT, Soddie J., 1st Lieut., Cairo, Ill., Scott Field, Ill.
BINDER, Paul, 1st Lieut., Chicago, Scott Field, Ill.
BIRNDORF, Leonard, 1st Lieut., Detroit, 27th Division, Fort McClellan, Ala.

SANTORO, George R., 1st Lieut., West Brighton, S. I., N. Y., Fort Hamilton, N. Y.
SAX, Charles E., 1st Lieut., Paterson, N. J., Camp Blanding, Fla.
SCHACHNO, Joseph, 1st Lieut., Brooklyn, Camp Claiborne, La.
SCHILDKRAUT, Milton, 1st Lieut., Bronx, N. Y., Camp Croft, S. C.
SCHOFIELD, Oscar, 1st Lieut., Brooklyn, Camp Claiborne, La.
SCHWARTZ, Marcus, Captain, White Plains, N. Y., Induction Station, Fort Jay, N. Y.
SCHWARTZ, Serge D., 1st Lieut., New York, Fort Bragg, N. C.
SHAW, Edward, 1st Lieut., New York, Plattsburg Barracks, N. Y.
SIEGEL, Edward, 1st Lieut., Poughkeepsie, N. Y., Plattsburg Barracks, N. Y.
SOLOMON, Marvin N., 1st Lieut., Bronx, N. Y., Fort Jackson, S. C.
SOLOVAY, Hyman, 1st Lieut., Brooklyn, Camp Blanding, Fla.
STACK, Harry G., Captain, Brooklyn, Induction Station, Fort Jay, N. Y.
STANTON, Edwin Y., 1st Lieut., Flushing, L. I., N. Y., Fort Hamilton, N. Y.
STARK, Charles W., 1st Lieut., Flushing, L. I., N. Y., Camp Upton, N. Y.
STECKLER, Julius, 1st Lieut., New York, Camp Claiborne, La.
STELMAN, Henry H., Captain, Buffalo, Fort Niagara, N. Y.
STIVALA, George J., 1st Lieut., New York, Camp Blanding, Fla.
STOLL, Bernard, 1st Lieut., Brooklyn, Camp Croft, S. C.
STROTZ, Charles M., Lieut. Col., Lyons, N. J., Plattsburg Barracks, N. Y.
SUSKIN, Samuel, 1st Lieut., Bronx, N. Y., Plattsburg Barracks, N. Y.
TADDEO, Mario C., 1st Lieut., Bronx, N. Y., Fort Bragg, N. C.
TAUSIG, Daniel P., 1st Lieut., New York, Fort Benning, Ga.
THORNE, Irving J., 1st Lieut., New York, Fort Benning, Ga.
TOPPERMAN, Samuel, 1st Lieut., Otisville, N. Y., Camp Stewart, Ga.
TURNER, Oscar A., 1st Lieut., Brooklyn, Fort Bragg, N. C.
VACCA, Joseph G., 1st Lieut., Kingston, N. Y., Fort Jackson, S. C.
VALENTI, Frank D., 1st Lieut., New York, Camp Claiborne, La.
VIOLE, Lawrence E., 1st Lieut., Great Kills, S. I., N. Y., Camp Stewart, Ga.
WASSERMAN, Seymour H., 1st Lieut., Brooklyn, Fort Moultrie, S. C.
WELLER, Milton J., 1st Lieut., Brooklyn, Plattsburg Barracks, N. Y.
WILLINGER, Hyman, Captain, Bronx, N. Y., Fort Dix, N. J.
WOLTMANN, Charles E., 1st Lieut., Hoboken, N. J., Induction Station, Buffalo.
ZIPPEN, George J., 1st Lieut., New York, Fort Barrancas, Fla.

CORRECTION

Captain Zukauckas.—In the list of reserve officers ordered to active duty under the Second Corps Area in THE JOURNAL May 3, page 2061, Edward W. Zukauckas of Brooklyn was listed as a first lieutenant serving at Fort Dix, N. J., when he should have been listed as a captain.

Orders Revoked

ASSEY, Philip E., 1st Lieut., Georgetown, S. C.
GREEN, Albert H., Major, Birmingham, Ala.
MATHIAS, Marion L., 1st Lieut., Charleston, S. C.
MORROGH, Lailor A., Jr., 1st Lieut., Breauux Bridge, La.
NOLAN, Lewis E., Captain, St. Petersburg, Fla.
NOTO, Joseph J., 1st Lieut., Baton Rouge, La.
SCOTT, William S., 1st Lieut., Spartanburg, S. C.
STANFIELD, William W., 1st Lieut., Dunn, N. C.
WAGNER, Rudolph T., 1st Lieut., Miami Beach, Fla.

Relieved from Duty

BRACKSTONE, LeRoy B., 1st Lieut., Iuka, Miss.
CARDWELL, Edward S., Jr., 1st Lieut., Memphis, Tenn.
DAVIS, Charles W., Jr., 1st Lieut., Humboldt, Tenn.
MARTIN, Marion T., 1st Lieut., Memphis, Tenn.

BOHORFOUSH, Joseph G., 1st Lieut., Madison, Wis., Air Corps Basic Flying School, San Angelo, Texas.
BOICE, William A., Captain, Chicago, 5th Division, Fort Custer, Mich.

WILLIAMS, Harold Murphy, 1st Lieut., Fort Worth, Texas.
WOOLF, Jack L., 1st Lieut., Dallas, Texas.
WYATT, Malcolm H., 1st Lieut., Amarillo, Texas.

BED CAPACITY OF ARMY HOSPITALS

The U. S. Army will have nine new general hospitals by the end of 1941, according to a report prepared by the Construction Division of the Office of the Quartermaster General. In addition, there are one hundred and thirty-three post hospitals on various military reservations throughout the country.

Of the total of thirteen general hospitals, which will have thirteen thousand, seven hundred and fifty-eight beds, four are established, six were recently completed and three are under construction.

The post hospitals have a total of sixty-five thousand five hundred beds and they are equipped to handle any kind of medical or surgical case. The post hospitals are established, however, with the view of handling short-time patients. The general hospitals receive patients requiring long confinement, patients suffering from chronic ailments and, where it is possible to move over, with the view of handling short-time patients. The general hospitals are located in important cities or army posts which are easily accessible to troops stationed in their particular part of the country.

In addition to maintaining the highest standards of medical science, the hospitals are equipped with the most modern utilities—electrical equipment, water supply, sewage disposal plants and systems, heating, laundries, kitchens and fire protection.

The following general hospitals have been completed recently:

Hospitals	Bed Capacity
Barnes General Hospital, Vancouver Barracks, Washington.....	750
Lawson General Hospital, Chamblee, near Atlanta, Ga.....	2,000
LaGarde General Hospital, New Orleans.....	1,000
Stark General Hospital, Charleston, S. C.....	1,000
Hoff General Hospital, Santa Barbara, Calif.....	750
Billings General Hospital, Fort Benjamin Harrison, Ind.....	1,000

At the Stark General Hospital—generally regarded as a model institution in the South—four accessory buildings are to be constructed. They are a hospital barracks, Red Cross

recreation building, ambulance garage and administration building. The hospital takes up 30 acres of ground and is surrounded by a 319 acre tract also owned by the government.

The hospitals still under construction are as follows:

Hospitals	Date of Completion	Bed Capacity
O'Reilly General Hospital, Springfield, Mo., Aug. 24, 1941.....		1,000
Tilton General Hospital, Fort Dix, N. J., uncertain.....		1,000
Lovell General Hospital, Fort Devens, Mass., uncertain.....		1,000

The following are the long-established general hospitals of the army in continental United States:

Hospitals	Bed Capacity
Letterman General Hospital, San Francisco.....	1,204
Fitzsimons General Hospital, Denver.....	1,458
Army and Navy General Hospital, Hot Springs, Ark.....	412
Walter Reed General Hospital, Washington, D. C.....	1,184

ARMY'S PHYSICAL THERAPY COURSE TO BE SHORTENED

Because of the great demand made on the Army's Physical Therapy School for trained personnel to staff new hospitals, the school's one year course for physical therapy aids will be reduced to six months on July 1. It is contemplated that the students will then be sent to Army hospitals for an additional six months of practical supervised training. The school is conducted at the Army Medical Center, Washington, D. C., and has graduated two hundred and twenty-five young women since it was inaugurated in 1922.

GENERAL WILLIS TO COMMAND REPLACEMENT CENTER

Brig. Gen. John M. Willis, M. C., United States Army, has been assigned to command the Medical Department Replacement Center at Camp Grant, Rockford, Ill.

ORGANIZATION SECTION

PROCEEDINGS OF THE CLEVELAND SESSION

MINUTES OF THE NINETY-SECOND ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CLEVELAND, JUNE 2-6, 1941

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 2

The House of Delegates convened in the Euclid Ball Room of the Hotel Statler and was called to order at 10 a. m. by the Speaker, Dr. H. H. Shoulders.

Preliminary Report of the Reference Committee on Credentials

A preliminary report of the Reference Committee on Credentials was submitted by the chairman, Dr. G. Henry Mundt, Illinois, who reported that one hundred and thirty delegates with proper credentials had registered.

Dr. Mundt moved that Drs. A. R. McComas and R. L. Diveley, Missouri, whose names are included on the official list but who did not present credentials, be seated. The motion was seconded by Dr. A. T. McCormack, Kentucky, and carried.

Dr. Mundt later stated that additional delegates with proper credentials had registered, making a total of one hundred and fifty-two at this time.

Roll Call

The Secretary called the roll and announced that a quorum was present.

Distinguished Service Award

Dr. Arthur W. Booth, Chairman of the Board of Trustees, presented the following report:

The Committee on Distinguished Service Awards of the American Medical Association submitted five names to the Board of Trustees. In accordance with chapter VI, section 5, of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order: Dr. James Ewing, New York; Dr. Simon Flexner, New York, and Dr. Ludvig Hektoen, Chicago.

The Speaker appointed as tellers Drs. Samuel J. Kopetzky, New York; Olin H. Weaver, Georgia; Leon J. Menville, Louisiana; B. F. Cook, Vermont, and Henry Cook Macatee, District of Columbia.

The tellers spread the ballot, and the Secretary announced that one hundred and fifty-two votes had been cast, of which Dr. Ewing received ninety-one, Dr. Flexner fourteen and Dr. Hektoen forty-seven.

The Speaker declared Dr. James Ewing, who received a majority of the votes cast, to be elected by the House to receive the Distinguished Service Award of the American Medical Association.

Adoption of Minutes of New York Session

On motion of Dr. A. T. McCormack, Kentucky, seconded by Dr. John Z. Brown, Utah, and carried, the House dispensed with the reading of the minutes and adopted the minutes as published.

Address of the Speaker, Dr. H. H. Shoulders

The Vice Speaker, Dr. R. W. Fouts, Omaha, presided while the Speaker, Dr. H. H. Shoulders, read his address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker, Members of the House of Delegates and Guests:

I wish first to express to the members of the House my appreciation of the honor and privilege of greeting you again as your presiding officer. I wish especially to acknowledge my

indebtedness to you for your forbearance toward my shortcomings.

It is the desire and purpose of your Speaker to cooperate with the membership of the House in such a way that the actions taken on every matter presented will truly reflect the deliberate judgment of the House. Trick parliamentary procedures may have a place in political assemblies, but not here.

At this time I wish to pose a question and then answer it very briefly. The question is this: Whom do you, as Delegates, represent? It is more accurate to state the question in this form: What interest or interests do you represent? It is true, of course, that you represent the more than one hundred and eighteen thousand doctors who sent you here. But what interest of theirs do you represent? Is it a selfish pecuniary interest? Or is it their ideas and ideals with regard to medicine as an agency for human welfare?

A Representative in the national Congress represents the interests of his constituents. It appears that their political and economic interests are uppermost in his mind. His effectiveness as a representative, it seems to me, is too often measured by the number and the amount of the appropriations he obtains for projects in his district. You represent no such interest. You make no such appropriations. You do not even vote as to the amount of the fee a single constituent you represent may charge for a single item of service he may render. Furthermore, your effectiveness as a representative cannot be measured in terms of financial or political benefits to your constituents, either direct or indirect. A careful review of the actions of this House on many matters touching this question, over a long period of years, it seems to me, would lead any unbiased person to the conclusion that it is the ideas and ideals of the medical profession with regard to medicine which you represent, and that in no sense do you represent the selfish pecuniary interests of doctors. It is true that you represent the science and art of medicine as an agency for human welfare. You do not, however, represent doctors as the owners of the science of medicine. Doctors do not, and have never pretended that they do, own the science of medicine.

When Abraham Lincoln died, a member of his cabinet walked from the room and said "Abraham Lincoln now belongs to the ages." That phrase, in my opinion, correctly expresses the ownership of the science of medicine. It truly belongs to the ages. Too many different individuals in too many different countries in too many different ages of the world have made contributions to the science of medicine for any nation or any group of citizens anywhere to lay claim to its ownership.

The relationship of the organized profession of medicine to the science of medicine is recognized by all of us as a trusteeship. The attitude displayed by the profession to the science through the ages has been that of a trustee in every sense of the word—guarding with diligence and fidelity something of value for the benefit of others. This book of science has been kept wide open by reason of policies and principles enunciated by this House and observed by the profession. You have erected no barrier of any character which stands in the way of the appropriate use of any medical discovery of proved benefit to a sick person or the public health. On the contrary, your actions have prevented that very thing from happening. In addition you have promoted progress under the influence of such restraints and guidance as make progress safe.

It is to be remembered that the science of medicine, in reality, embraces portions of several sciences, such as chemistry, biology and bacteriology. These are of no earthly use to ailing humanity until they have gone through the long and tedious process of adaptation by which they are made applicable to human needs in a way that is most beneficial and least dangerous. We know better than most people that "everything that is potent for good is also potent for evil." Even the tongue may do harm when "not bridled." The bridle is not used just to stop a horse: it is used to guide him in the way he should go in service and duty. The art of medicine, of course, is an individual accomplishment. The art or skill, if you please, of using a scalpel for the relief of an ailment is as truly an individual accomplishment as the ability to paint a picture or fashion a statue of marble or bronze.

You represent the art of medicine, but in no sense do you represent any selfish interest of the art. You represent those who have by years of study and effort acquired the art. But you do not represent and have never promoted their selfish use of it. In a very real sense you represent the public interest in this science and this art. This public interest has been the concern of the profession and your primary concern in every expression of principle enunciated by you in relation to the application of this science and this art to human needs.

This is a brief and very inadequate statement of the interests you represent. It does in a measure answer the question put. In my opinion all these interests have been represented in this House in such a way as to stimulate a sense of pride in each of us at this moment. It is natural and proper that you should desire and even expect approval of your actions by each and every interest you have so faithfully represented. Your appeal for such approval, however, has been and must be addressed to the higher elements in human nature. You could not address an effective appeal to the lower instincts, if you felt inclined to do so, for the simple reason that you do not possess the means for such an appeal.

Your task is difficult, of course. It is difficult by reason of the nature and variety of all the interests you represent. It calls for qualities of leadership which, to say the least, are a bit unusual at the present time, and an attitude toward your task which is all too unusual. It requires not only a broad knowledge of the broad subject of medicine and its proper uses in relation to human needs, it requires a degree of integrity which money cannot tempt and flattery cannot influence. It requires a courage which stands firmly against odds, apparently overwhelming. It requires wisdom that is born alone of experience. It requires the virtue of charity akin to that which uttered the prayer "Father, forgive them, for they know not what they do." It requires the ability to see human nature as it is: its virtues and its faults; its generosity and its greed; its loves and its hates; its strength and its weakness; its hopes and its fears. It requires vision—a vision which penetrates this tangled maze of conflicting attributes of human nature and envisions the future.

In conclusion may I venture the opinion that the profession of medicine throughout the world, and an increasing number of enlightened lay people in our own land, are placing an increasing faith in and reliance on you for leadership in the solution of problems requiring medical statesmanship.

In Memoriam

In accordance with the established custom of the House of Delegates of taking official notice of the death of Fellows who have served the Association in official capacities, either as members of the House or as officers of the Association, the Speaker called the roll of those who have passed away since the House met in June of 1940, as follows:

(The dates following the names indicate years of service in House or year or years in which officers held official positions.)
Lemuel P. Adams, California, 1925.
Floyd J. Atwell, New York, 1937-1938.
William C. Braisted, U. S. Navy, President-Elect 1919-1920; President 1920-1921.
Roger Brooke, U. S. Army, 1938.
Bertram L. Bryant, Maine, 1920-1923; 1925-1928; 1930-1933.
Joseph T. Buxton, Virginia, 1920; 1922; 1924.
Willis C. Campbell, Memphis, Tenn.; Section on Orthopedic Surgery 1939.
Guy S. Carpenter, New York, 1940.

E. E. Cornwall, New York, 1911-1912.
Walter F. Enfield, Pennsylvania, 1923.
William L. Estes, Pennsylvania, 1909.
Louis Frank, Kentucky, 1918.
E. J. Goodwin, Missouri, 1909-1918; 1925-1934.
C. A. Gray, Texas, 1928.
William W. Harper, Alabama, 1928.
Willis F. Hart, Maine, 1918.
John A. Hatchett, Oklahoma, 1905-1906. Second Vice President 1908.
Austin A. Hayden, Chicago. Treasurer 1922-1933; Trustee 1933-July 10, 1940.
Emory Hill, Virginia, 1924; Section on Ophthalmology 1934-1936.
Edgar A. Hines, South Carolina, 1910-1928; 1930-1940.
Charles R. Hume, Oklahoma, 1918-1919.
Charles E. Humiston, Illinois, 1915-1916; 1918-1919; 1921-1935 Special Session. Member Council on Medical Education and Hospitals 1930-1937.
R. D. Kennedy, Arizona, 1928-1929.
Hermann J. G. Koobs, South Dakota, 1919.
Le Roy Long, Indian Territory, 1903-1904; Oklahoma, 1920.
John J. McGovern, Wisconsin, 1913-1914.
F. Clifton Moor, Florida, 1934.
Fred Moore, Iowa, 1927; 1931-1940. Member of Council on Medical Education and Hospitals 1934-April 8, 1941.
Arthur C. Morgan, Pennsylvania, 1911; 1929-1938.
John P. Munroe, North Carolina, 1915.
Oliver T. Osborne, New Haven, Conn., Section on Materia Medica, Pharmacy and Therapeutics 1902-1903; Section on Pharmacology and Therapeutics 1908.
Ira N. Pickett, Nebraska, 1905-1906.
William Allen Pusey, Chicago, Section on Dermatology 1910; 1914. Treasurer 1911-1922. President-Elect 1923-1924; President 1924-1925. Illinois delegate 1926-1932.
Charles B. Reed, Illinois, 1933-1940.
Charles Richard, U. S. Army, 1907; 1914.
Andrew F. Richards, Tennessee, 1917-1918.
Stewart R. Roberts, Georgia, 1916-1920.
Joseph W. Schereschewsky, U. S. Public Health Service, 1918-1922.
Alfred J. Scott Jr., California, 1934; 1936.
Arthur C. Scott, Texas, 1911; 1924-1927.
Harry C. Sharp, Indiana, 1909.
Dudley Smith, California, 1927-1930; 1932.
Elsworth S. Smith, Missouri, 1920.
Richard R. Smith, Michigan, 1911-1912.
Howard L. Snyder, Kansas, 1936-1940.
John G. South, Kentucky, 1920-1921.
Thomas S. Southworth, New York, Section on Diseases of Children 1907.
C. E. Stackhouse, North Dakota, 1935 Special Session.
Charles Stover, New York, 1908; 1910.
Magnus A. Tate, Ohio, 1923; 1925-1928.
Samuel J. Waterworth, Pennsylvania, 1917; 1926; 1928.
Horace G. Wetherell, Colorado, 1910; 1912. Section on Obstetrics and Gynecology 1917-1918.
Charles J. Whalen, Illinois, 1915-1918; 1920-1940.
Carl Lewis Wheeler, Kentucky, 1913; 1916-1919. Section on Urology 1922.
William V. Whitmore, Arizona, 1910.
William N. Wishard, Indiana, 1902-1910. First Vice President 1918.
Thomas A. Woodruff, Chicago. Section on Ophthalmology 1909-1910; 1913. Third Vice President 1908.

As was so well said of another who died, as they did on the field of duty, we can truthfully say of each of our departed associates and friends:

When a star is quenched on high,
For ages will its light
Still travel downward from the sky,
Shine on our mortal sight.
So, when a good man dies,
For years beyond our ken
The light he leaves behind him lies
Upon the path of men.

On motion, duly seconded and carried, the delegates arose and stood in silent tribute to the memory of the deceased delegates and officers.

Reference Committees

The Speaker announced the personnel of the Reference Committees. Included in the list which follows is the personnel of a Reference Committee on Military Preparedness, the appointment of which was later authorized by the House:

SECTIONS AND SECTION WORK

George W. Kosmak, Chairman.....New York
David D. Scannell.....Massachusetts
Hilton S. Read.....New Jersey
Rollo K. Packard.....Illinois
B. J. Hein.....Ohio

RULES AND ORDER OF BUSINESS

Thomas F. Thornton, Chairman.....Iowa
Floyd S. Winslow.....New York
James Q. Graves.....Louisiana
Joseph F. Smith.....Wisconsin
E. N. Roberts.....Idaho

MEDICAL EDUCATION

Walter G. Phippen, Chairman.....	Massachusetts
Elbridge J. Best.....	California
Carl R. Steinke.....	Ohio
Louis A. Buie.....	Section on Gastro-Enterology and Proctology
Wingate M. Johnson.....	North Carolina

LEGISLATION AND PUBLIC RELATIONS

Henry A. Luce, Chairman.....	Michigan
F. J. Pinkerton.....	Hawaii
John H. Fitzgibbon.....	Oregon
Terry M. Townsend.....	New York
F. S. Crockett.....	Indiana

HYGIENE AND PUBLIC HEALTH

Arthur T. McCormack, Chairman.....	Kentucky
Warren F. Draper.....	U. S. Public Health Service
Lewis B. Bates.....	Isthmian Canal Zone
L. W. Larson.....	Section on Pathology and Physiology
William D. Johnson.....	New York

AMENDMENTS TO CONSTITUTION AND BY-LAWS

William Weston, Chairman.....	Section on Pediatrics
Edward M. Pallette.....	California
Edmund R. Brush.....	Ohio
J. N. Baker.....	Alabama
Walter W. King.....	Colorado

REPORTS OF OFFICERS

C. W. Roberts, Chairman.....	Georgia
H. G. Hamer.....	Indiana
L. G. Christian.....	Michigan
A. R. McComas.....	Missouri
Walter B. Martin.....	Virginia

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Francis F. Borzell, Chairman.....	Pennsylvania
F. J. Savage.....	Minnesota
Robert A. Peers.....	California
William R. Brooksher.....	Arkansas
Meredith Mallory.....	Florida

CREDENTIALS

G. Henry Mundt, Chairman.....	Illinois
Arthur J. Bedell.....	Section on Ophthalmology
Raymond L. Zech.....	Washington
J. Newton Hunsberger.....	Pennsylvania
A. P. Nachtwey.....	North Dakota

MISCELLANEOUS BUSINESS

Charles G. Strickland, Chairman.....	Pennsylvania
Frederic E. Sondern.....	New York
Holman Taylor.....	Texas
Charles E. Kiehl.....	Ohio
Andrew F. McBride.....	New Jersey

EXECUTIVE SESSION

Thomas A. McGoldrick, Chairman.....	New York
Charles H. Henninger.....	Pennsylvania
Deering G. Smith.....	New Hampshire
E. S. Hamilton.....	Illinois
Guy W. Wells.....	Rhode Island
E. G. Wood.....	Tennessee
James R. Miller.....	Connecticut

MILITARY PREPAREDNESS

Harvey B. Stone, Chairman.....	Maryland
James E. Paulin.....	Section on Practice of Medicine
Sam E. Thompson.....	Texas
John H. O'Shea.....	Washington
Samuel J. Kopetzky.....	New York
E. H. Skinner.....	Section on Radiology
Joseph F. Smith.....	Wisconsin

SERGEANTS AT ARMS

A. A. Ross.....	Texas
Frank E. Reeder.....	Michigan
John Z. Brown Sr.....	Utah

Address of President Nathan B. Van Etten

The Speaker resumed the chair and presented the President, Dr. Nathan B. Van Etten, New York, who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker and Members of the House of Delegates:

It is impossible to suppress an emotional regret that this is my valedictory. Although my bones are old, my spirit is still inquisitive. Fifty years of medical practice during a period of almost incredible scientific revelations stimulates a longing to see the unpredictables of the next half century. As the curtain is partly lifted on scenes of new therapy, of new developments in immunology, of new and daring surgery, of new social science, of new adventures into the mysteries of human behavior, of inevitable readjustment of world geography, one can neither

fold one's hands and close one's eyes in complacent retrospection nor suppress resurgent anxiety over our immediate social future.

PROGRESS IN MEDICINE

The American Medical Association has attained the dignity of age as it has grown from a small group of founders in 1846 to its present stature of one hundred and eighteen thousand members. Ninety-five years of progress present an inspiring panorama. The triumphs of optimism, the evolution of science, the insistence on the highest possible qualification of the doctor of medicine, the romance of the physician as he progressed from empiricism to scientific controls and from the saddle bag to the automobile stimulate dreams of wonder as to whether the century ahead can be as remarkable as the century just past.

One must credit the founders of 1846 with being just as up to date as you are in 1941 as you view with amazement new discoveries which may completely change your conception of medical practice. Postgraduate education has as great importance for the physician of 1941 as it had for his predecessor of 1846. Unless the physician of 1941 is alive to the unfolding medical and surgical drama, he will find himself so far behind the procession that he will be unable to keep step with a public which is trying to understand the sensational revelations which are broadcast in the daily press.

I am profoundly grateful to the House of Delegates of the American Medical Association for many opportunities to share the responsibility of forming some of the policies of American medicine these many years and for selecting me as an official messenger to all American physicians two years ago. These are the greatest privileges that can be given to any American physician. In this room in 1934, as chairman of a reference committee, I had the honor to present for your approval a ten point program which seems to have stood the test of the last seven turbulent years. It has survived severe criticism especially directed at one of its essentials, "free choice of physician." Some self-esteemed persons have admitted that freedom to choose a doctor was quite right for themselves as they carried their arthritis to Philadelphia or Boston, their surgery to outstanding operators and their eyes to the best ophthalmologists. Their denial of the value of free choice applies only to other less fortunate persons. Mass medicine is wonderful for everybody except themselves. They would prescribe but cannot swallow their own medicine.

In 1939 you formulated an eight point platform which stems from the program of 1934. The essence of this platform is centralization of national health functions and decentralization of individual sickness under local control. The platform has had wide approval and at the present moment Washington health bureaus are operating under the coordinating directions of the Federal Security Administrator. This is perhaps the logical manner of correcting a multiplication of health functions distributed through many agencies in many government departments and may be the answer to the prayer of the Delegates of 1875, which was reaffirmed in 1939, even though it required a world convulsion to accomplish it.

This matter has been discussed freely during the past two years, and a bill to create a National Department of Health was introduced in the House of Representatives by Mr. Pfeiffer of New York in 1939. This bill was referred to the Committee on Administration Expenditures and died there. It was reintroduced in 1941. The Federal Security Administrator has strongly advocated the establishment of a National Health Department to be headed by an officer of Cabinet rank. Other statesmen have expressed favoring opinions. I commend this matter to your careful and appropriate action. A National Health Department is now functioning—without the title and without its director in the cabinet of the President. I trust that the national emergency will at least result in the permanence of this new government reorganization. It is a safe prediction, however, that this new alignment of Washington bureaus will be violently opposed by officials who will fear loss of place or prestige. If this House continues to favor the establishment of a National Health Department, it must continue to fight for it.

CENTRALIZATION OF GOVERNMENT HEALTH FUNCTIONS

I am in complete disagreement with those who claim that centralizing what are now government health functions means more state medicine. In a federacy of forty-eight states certain blanket powers such as those needed to protect state lines in the instance of the dangers of spreading communicable disease would be most desirably concentrated in a single agency. The migrating indigent as he moves from state to state carrying his diseases along with his poverty presents health problems that cannot be controlled successfully by state governments. The protection of all our frontiers from invasion by those who may bring physical or moral or mental disease and become public menaces and public charges cannot be the responsibility of state government.

The Veterans Health Administration, which will inevitably expand to vast proportions, must be a national problem; it is really state medicine and should be. On the other side of the question, your platform of 1939 recognizes that individual sickness cannot wait for the state capitol or Washington to diagnose, segregate or prescribe; it must be treated on the spot, when it is discovered, in the smallest political subdivisions and controlled by the local medical profession.

POLICIES OF THE AMERICAN MEDICAL ASSOCIATION

The American Medical Association has been subjected to attack by certain groups with special interests as a selfish, reactionary, antisocial and restraining influence, opposing the activities of those who desire to practice group or cooperative medicine or any new plans for the delivery of medical care; it is accused of indifference and inertia in its attitude toward public health agencies. The language of these attacks declares, in the words of a New York newspaper of Tuesday, May 6, 1941, that the American Medical Association believes "that everything is right as rain" concerning the health of the underprivileged or the indigent or the unfortunate who cannot afford to pay for any medical care. This descent from the truth to mud slinging in order to illuminate an inspired article is interesting to you members of the House because you know that the American Medical Association, whose policies you form, desires for the American people only the best service for their best interests and their protection from any form of quackery which would exploit them when they are sick, and favors public health measures under proper auspices which can be used to keep them well and prevent infection regardless of race, creed, class or financial competence. The same article colors its argument with arraignment of "the old guard of organized medicine" or "the top clique of the American Medical Association" or the "American Medical Association hierarchs." This should interest you members of the House of Delegates for the reason that if there is such a thing as "the old guard of Organized Medicine" you compose it. If there is such a thing as "the top clique of the American Medical Association" you are it. If there are "American Medical Association hierarchs" you are they.

The old idle talk about a small group of persons in Chicago, or sometimes one person, as dictating the policy of the American Medical Association still goes on. If there are any dictators in American medicine you are, because you alone are responsible for making our policies. Your elected officers are merely your executives.

Why do otherwise intelligent persons and some physicians continue to believe these old stories? I have heard them for more than twenty-five years. In some manner we must be failing to present a clear and convincing picture of our organization. Can you not take the trouble to convince the people who sent you here and whose interest you serve that this is the most democratic of all democratic organizations? Can you not tell them that no one else delegated you to sit in this House and endowed you with power but the members of your county medical societies who sent you to your state societies, from which you were chosen for your high office? Can you not take the trouble to enlighten public opinion at your homes through your local newspapers and develop a consciousness of the realities of local health needs and promote them? Can you not tell the world that the loyalties of organized medicine are even more altruistic today than they have ever been before?

I have sat with your Trustees for eight years and I have observed the meticulous and exhausting patience with which they try in every way to carry out the spirit and the letter of the authorized actions of this House. Your Trustees handle your affairs without personal bias. They come from all regions of the country at great personal sacrifice, some of them every month, to concentrate their best intelligence on the execution of your decisions. Only one of them, Dr. Irons, lives in Chicago. Dr. West, Dr. Fishbein and Mr. Braun are executives. I have never heard or seen any of them attempt to originate any policy of the American Medical Association. I have heard these men called a "Triumvirate of Dictators." Mr. Braun could double your advertising if you would let him. Ethical advertising could yield to large volumes of uncensored advertising. Dr. Fishbein could travel in far more attractive financial fields than in those in which he is limited by his strict loyalty to the service of American medicine, to which he has dedicated his brilliant talents. Dr. West has been called a "Pooh-Bah" by some loose thinking space writers, possibly because he has been inflexible in his devotion to the principles that have been evolved in this house. He has frankly and forcibly expressed his convictions on many occasions, but he has never dictated policy.

Authors whose mental processes seem to have been influenced by Moscow or Berlin have written volumes of destructive criticism concerning the policies of the American Medical Association and the personalities of your executives. If these strictures on these characters who are so vital to the success of your organization have gained any credit in your minds, you should bring your doubts or your questions before the House for appropriate action. If you deny the truth of these allegations, you should at this time express your high appreciation of their unselfish devotion.

THE COMMITTEE ON MEDICAL PREPAREDNESS

At your session in New York last June the government of the United States made a formal request for help in the mobilization of medical personnel for national defense and you authorized the Speaker to appoint a nationwide Committee on Medical Preparedness. This committee has been at work for a year with a resulting mass of tabulated information that justified its existence and revealed that 95 per cent of American physicians are loyally willing to support the military services of the United States when and where they may be needed. This extraordinary record of patriotic expression strikes a high note of enthusiasm for the preservation of the integrity of our national existence and denies the claims of discord within the ranks of medicine which have been made by a few physicians, who have openly declared that our entire social structure must be leveled and rebuilt after the communistic manner. There can be no room in organized medicine for destructive ideologists if we are to continue to believe in the cohesive altruism which has survived the social revolutions of the centuries and which is now carrying us to still higher planes of public service. Our professional honor must never become a political football or be involved in interracial, interreligious or international battles that threaten our high position as a scientific and humane body. As Americans we must stand for whatever is best for America. As physicians we must stand for the best of mental, moral and physical health for all the world.

Address of President-Elect Frank H. Lahey

The Speaker presented the President-Elect, Dr. Frank H. Lahey, Boston, who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

Mr. Speaker and Members of the House of Delegates:

As I see my responsibility in this address, it consists of calling your attention to things which have come to my mind while in the position of President-Elect, as I have been during the last year, and while interested and participating in the activities of the American Medical Association, as I have been for the past several years.

It has always interested me that an organization as large as the American Medical Association in terms of its membership, in terms of the number of people employed in it and in terms

of the income and expenditures involved in its conduct, and as broad and as varied as are, of necessity, its interests could be run as well as it is. It is additionally surprising that it functions as satisfactorily as it does—and we all admit that it functions very satisfactorily—in view of the fact that its destinies are controlled and directed by a group of men whose primary interest is scientific and who have, in addition, many unavoidable local responsibilities and, behind all of that, the need of raising and supporting families. Furthermore, it has always seemed to me that the American Medical Association has functioned surprisingly well when so much of the work must be done by paid representatives in extremely peculiar positions. They must direct really large affairs without final authority and without establishing a bureaucracy. They must please a vast majority but still maintain a large amount of independence of thought and action. In view of the peculiarity of this situation, it seems to me that the American Medical Association has been conducted very well. In the conduct of its affairs it has made mistakes, but they have been largely those of minor magnitude. No really gross mistake in the way of policy or management can truly be charged against this Association.

I have repeatedly thought as I have watched the functioning of the American Medical Association from within its executive circles that no one can possibly really evaluate what the American Medical Association has done for American medicine and, through that, for world medicine by its various activities without having lived intimately with the inner workings of the American Medical Association. For one to appreciate fully these values, the American Medical Association would really have to be destroyed and the country would have to exist without it over a period of time. The American Medical Association is undoubtedly not unlike a good wife—only fully appreciated when lost. We are all so adjusted to the aid, the resources and the helpful facilities of the Association that we tend, I believe, to make the mistake that is so often made by unappreciative husbands who think of their good wives much as they think of a comfortable piece of furniture. Not only does this thought, it seems to me, relate itself to those of us within medicine who benefit from its help and existence but, with even greater probability of the truth of the statement, by the lay public and by the government itself.

I have watched many of my friends pass through the occupancy of the position of President of the American Medical Association, and I have always promised myself that when the opportunity arose I would direct attention to the pressing need of protecting those men who occupy that position from the necessity of seriously affecting their health during that period. It is, I believe, extremely important not to place the responsibility of overconscientious fulfillment of the duties of this position on the shoulders of those who occupy it. They must of necessity always lean over backward in their desire to fulfil what they believe to be their obligations. They need your protection.

State societies, postgraduate meetings and local societies have properly, but naturally, one purpose; that is, to make their meetings the greatest possible success. They have no knowledge of the demands on the President's time and therefore no consideration for his health. They are conscious only of the immediate need for the success of their meeting. They have no knowledge or great interest in the number of engagements the President of the American Medical Association may have. Thus the tendency of the President, in his desire to satisfy every one, is to overdo.

There is therefore a need for assistance from the Association in publicizing to the state societies the necessity for the President of the American Medical Association to care for his health, and that this responsibility should not be entirely placed on the occupant of the position lest it be interpreted as a lack of willingness on his part to undertake all the obligations he should.

None of these suggestions have anything to do with me personally. I do not need the help, because I happen to be so constituted as to be able to decide for myself what is and what is not proper, and what I can and cannot do within reason. I happen also to be so independently situated that I can take

a position regarding obligations and stand on it. I am particularly impelled to speak of this because of the record as to the health of past presidents at the completion of their terms of office, because it has been so bad and because I wish to do something constructive for those who are to follow me.

I am probably as well able to handle this situation as almost any one, provided as I am with a large amount of clerical and professional help and with patients already well trained and adjusted to my frequent absence. Before occupying this position I had already become well immunized to travel, public addresses and a trouper-like existence. But even in the face of all this, when it is, as it is at times, difficult for me, I appreciate what it must be for a man practicing as an individual. It should not be necessary for a president of the American Medical Association to give up his practice. It should not be necessary to limit the selection of presidents of the American Medical Association to those who are giving up their activity in medicine and who are losing touch with active affairs. This is not what we should want. The men who are presidents of the American Medical Association should be men who are actively living with the live problems, not those who are tending to approach them from a sequestered and philosophic point of view.

While I am on this subject I should like to suggest that society meetings and nonprofessional groups may possibly be demanding too much of the time of some of our paid executives at headquarters in Chicago. It must likewise be a considerable tax on their nervous and physical energy, as has been stated in relation to the President. Must not those who occupy important executive positions at our headquarters be given the same consideration that presidents of the Association are given? With the demands for them at many meetings, may it not also become essential for them to decide whether or not the increasing burdens and responsibilities at headquarters necessitate their accepting less traveling and speaking engagements? May it not even be possible, as a suggestion, that the printed word, involving as it does the opportunity to measure carefully and evaluate its meaning before finally put into print, may be a more sound and safe way to publicize the activity of our society without the possibility of promotion of undesirable, critical reactions?

Probably few men have had a greater opportunity to interpret the reactions of the medical public throughout America than have I. I can truthfully say, and I am pleased to be able to state it to you, that the reactions of the medical public in America to the activities of the American Medical Association are with few exceptions extremely approving and appreciative. Having occupied various positions in the American Medical Association—as an officer of a section and as a member of the Council on Scientific Assembly and later of the Council on Medical Education and Hospitals—and having attended so many meetings in intimate contact with those giving so generously of their time to the conduct of these meetings, and at the same time sitting outside the circles of active participation in the House of Delegates and the other activities of the Association, I have been able to develop at this distance some ideas which I can at least mention to you. One that has occurred to me is the necessity of selecting young men as representatives in the House of Delegates of the American Medical Association and as members of various important committees of the House of Delegates. One of the greatest mistakes, it has always seemed to me, in the executive management of large affairs has been to put complete control into the hands of an older group of men and to fail to realize that there must be developed, by experience and by contact with problems, a constant supply of younger men. They secure from this experience the ability to take over the reins when the older men no longer are active. It has been my experience to see so many institutions, business and professional, come to a bad end through failure to appreciate this point. It will always be necessary for growing organizations to have fresh points of view as well as fresh, youthful representation, and to develop men interested in the organization side of medicine early in their careers.

With a full realization of the delicacy of the situation, yet with an equal realization of my responsibility to speak my mind as the representative of such a large body of men, and because I am so sincerely interested in seeing the American Medical

Association continue* to occupy not only the place it does in American medicine but an even greater one, I am impelled to make the statement that is so outstandingly a conviction in my mind that it is extremely desirable that we be ever conscious of the fact that the Presidency of the American Medical Association should largely seek the man and not the man the position. Too much competition in the selection of men for President of the American Medical Association is injurious to it and, even more important, particularly injurious to the position that it does and must occupy in the minds of the American public.

It would be improper in an address to this group of men, who play such an important part in shaping and maintaining the policy of American medicine, if I were not to compliment the American Medical Association and other branches of medicine, such as the American College of Surgeons, the American Hospital Association and the specialty boards for their widening development of unselfish cooperation in the interests of better medicine now and for the future. We should all be conscious of the fact that what appeared to be in the beginning natural hostilities have been overcome in time. A better acquaintance of these groups with one another is constantly smoothing out difficulties which have in the past played a considerable part in slowing the progress of development and in preventing the accomplishment of changes of real advantage. The way has undoubtedly been cleared considerably by the elimination of personalities, which are natural and apparently inevitable, but which in the past generation undoubtedly have so hampered this progress which is so desirable.

I cannot close my remarks to this group without at least making a brief mention of the national situation. If we are frank with ourselves, and now certainly in this period it is desirable to be so, there are few of us who do not feel a sense of injustice regarding the attitude of the government toward organized medicine. I say this not in order in any way to be critical of government or of those who have to do with what a majority of us would consider injustices, but rather to plead that these are but trivial and possibly necessary features in our existence in these trying times. I mention them solely with the purpose to plead that they be not permitted to occupy any prominent position in our minds and to urge that we forget them and look toward the more urgent and important things at the present time, as I will state in my presidential address. Soon there will be made, and these remarks were written before it was made, a most important decision for this country and that is what is to be its position as relates to the world conflict. Suits, privileges, personalities, personal opinions in the light of that decision will, and should, occupy minor positions. The things that will need to be settled then will be: Can we subordinate our differences to the national need? Can we have that all important need in a conflict, national unity? Can we eliminate from our minds what we should like to have for what must be? That will be a real test of the democratic form of government. If we permit relatively unimportant trivialities to becloud our vision of this all important problem or if we permit personalities and personal differences to prevent us from giving wholehearted support to our country in this national emergency, we shall properly belong to that group so well described by Sir William Osler, who said "Only to the small is the trivial great."

REPORTS OF OFFICERS

Report of the Secretary

Dr. Olin West, Secretary, presented his report as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Report of Board of Trustees

Dr. Arthur W. Booth, Chairman, presented the report of the Board of Trustees as presented in the Handbook as well as the following supplementary report, which were referred to the Reference Committee on Reports of Board of Trustees and Secretary:

PAN AMERICAN RELATIONSHIPS

During the past year the Board of Trustees has had brought to its attention on several occasions the importance of the estab-

lishment of cordial relations and scientific interchange with our colleagues in South America, Central America, Cuba, Puerto Rico, Mexico and Canada. The Council on Scientific Assembly has had before it the question of arranging for suitable representation by these visitors on the scientific programs of the annual session. Several conferences have been held with the Coordinator for Pan American Affairs in Washington. The Board of Trustees has been impressed with the importance of facilitating further cooperation of this type in the interest of scientific advancement and unity of the American continents.

Report of Treasurer

Dr. Herman L. Kretschmer, Treasurer, presented his report as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the report of the Judicial Council as presented in the Handbook, as well as the following supplementary report, which were referred to the Reference Committee on Reports of Officers:

REVISION OF CONSTITUTION AND BY-LAWS AND OF PRINCIPLES OF MEDICAL ETHICS

Several items arising from the activities of the 1940 session of the House of Delegates, held in New York City, among them rewriting of the Principles of Medical Ethics and the revision of the Constitution and By-Laws with respect to membership and Associate Fellowship, have received the continuous attention of the Judicial Council during the past year. The Council is still of the opinion that the general state of the country and of the medical profession itself is so unsettled and confusing that no material change in either the Principles of Medical Ethics or the Constitution and By-Laws should be made until clarification of conditions takes place and more stability is established.

As instructed by the 1940 House of Delegates, the Judicial Council has devoted study to the proposal to consider representation of scientific sections in the House on a basis of their minimum registration at annual sessions.

The last reapportionment of delegates was made effective in 1941 and remains in effect through 1941, 1942 and 1943, at which time a new apportionment must be made for the 1944, 1945 and 1946 sessions of the House.

The Council believes that the number of angles involved in an equitable solution of this question justifies postponement of the Council's report on these matters until the 1942 session of the House of Delegates.

Report of Council on Medical Education and Hospitals

Dr. Reginald Fitz, Acting Chairman of the Council, presented the Report of the Council on Medical Education and Hospitals as presented in the Handbook, together with the following supplementary report:

TRIBUTE TO DR. FRED MOORE

The members of the Council on Medical Education and Hospitals record with deep sorrow and regret the death of Dr. Fred Moore of Des Moines, Iowa, which occurred on April 8.

Dr. Moore was born in Harlan, Iowa, May 10, 1883; received the degree of M.S. from the University of California in 1907; studied medicine at Western Reserve University and at the State University of Iowa College of Medicine from 1907 to 1911, receiving the degree of doctor of medicine from the latter institution in 1911. He served an internship at the Montreal General Hospital and in 1914 engaged in further studies in Baltimore. Dr. Moore had been a practitioner in Iowa since 1911 and for many years limited his practice to pediatrics. He had an office in Des Moines since 1915. He was director of the health department of the public schools of Des Moines and was on the staffs of the Iowa Methodist, Iowa Lutheran and Mercy hospitals.

Dr. Moore was completing the last year of a seven year term as a member of the Council on Medical Education and

Hospitals. He showed great interest in the work of the Council and until his illness had a perfect record of attendance at its meetings. In his early years as a member he listened and learned and in a short time his high ideals, tempered by a sympathetic understanding, together with his determination to maintain high standards of medical education, were of inestimable value in the deliberations of the Council.

INTERN HEALTH

Two years ago the Trustees asked of the Council on Medical Education and Hospitals that a study be made of the health of interns. Such a study was begun at once. A report of the preliminary steps of the investigation was presented to the House of Delegates a year ago. Briefly, there appeared no evidence to suggest that the health of interns was notably bad; yet among sixty-one interns who during the three year period of 1937, 1938 and 1939 were compelled to discontinue work because of illness, tuberculosis was an important and significant factor. This disease occurred in thirty-six instances and thus caused 59 per cent of all the serious casualties.

During the past year the problem of intern health has been further investigated from a different angle. Letters were sent to five thousand three hundred and one physicians who received their medical diplomas from recognized schools in 1937. They were asked to give an account of their hospital experience and also of the nature of any illness suffered during it, with a line stating the amount of time lost from work. This method of studying the problem was adopted in the belief that doctors in general might be interested in a study of this nature, and that, as a typical group, men and women four years out of medical school would remember their own illnesses with sufficient vividness as to make the data obtained both interesting and accurate.

Two thousand eight hundred and forty replies to the questionnaire have been received, and in addition are the records in the files of the American Medical Association of thirty-four fatalities known to have occurred among the men who graduated in that year.

Hospital life creates no immunity to illness. The types of illnesses to which these particular interns and residents fell heir make a glossary of diagnostic terms, though naturally respiratory infections were the commonest single incapacitator.

The illnesses, on the whole, were not incapacitating for long periods of time and proved to be of little more than a minor nuisance. There were three diseases which were encountered so frequently as to make them seem of significant importance. These were appendicitis, pneumonia and tuberculosis. There were 142 cases of appendicitis, there were 103 cases of pneumonia and there were 48 cases of tuberculosis.

In light of present knowledge, the illnesses which interns and residents are likely to acquire are not often strictly preventable. Interns and residents, however, should be given proper living quarters, adequate recreational facilities, good food, happy surroundings and some form of systematized medical supervision in order to protect their health reasonably and thus enable them to accomplish more. There should be enough interns in each hospital so that no one intern is grossly overworked. A friendly interest on the part of older members of the staff in the amount of work each intern does and in his physical and mental adjustments to it may do much to prevent catastrophes.

The problem of tuberculosis is important enough to receive particular consideration. Each hospital should make a rule to require chest roentgenograms of its interns at six month intervals. Large hospitals dealing with vast numbers of patients should go even further. They should require their interns and residents to have chest films at three month intervals. If a rule of this sort was made general, tuberculosis in the resident staff would be recognized more quickly than it is at present and unnecessary loss of the time spent in treatment would be saved.

On the whole, the health of doctors living in hospitals appears to be an important matter and it deserves careful consideration.

ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR CLINICAL LABORATORY TECHNICIANS

PREPARED BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION
WITH THE COOPERATION OF THE AMERICAN SOCIETY OF CLINICAL PATHOLOGISTS

PREAMBLE

Two organizations are primarily concerned with the training of clinical laboratory technicians: the Council on Medical Education and Hospitals of the American Medical Association and the Board of Registry of Medical Technologists of the American Society of Clinical Pathologists. The Council functions by inspecting, reporting and approving these schools, while the Board of Registry investigates and certifies the competence of the technicians.

The Council, with the cooperation of the Board of Registry, has promulgated standards for this type of training for the information of physicians, hospitals, prospective students and others and for the protection of the public.

Technicians are being trained in these schools to work under the direction of qualified physicians and not as independent practitioners of laboratory work.

I. ADMINISTRATION

1. Acceptable schools for training laboratory technicians may be conducted by general hospitals where the majority of the student's practical training is received. This arrangement should not discourage affiliations between the hospital and universities, colleges, public health laboratories or other hospitals.

2. Responsibility for the maintenance of the school should be placed on the hospital administrator rather than on the laboratory director.

3. Resources for continued operation of the school should be insured through regular budgets, gifts or endowments, but not entirely through students' fees. Experience has shown that commercial schools operated for profit frequently do not adhere to proper ethical and educational standards and therefore are not acceptable.

II. ORGANIZATION

1. Adequate space, light and modern equipment shall be provided in the laboratory department. A library containing up to date references, textbooks and scientific periodicals pertaining to clinical laboratory work and pathology should be maintained.

2. Satisfactory record systems shall be provided for all work carried on in the department. Monthly and annual classifications of the work of the department should be prepared.

3. Transcripts of high school and college credits and other credentials must be available. Records should be kept of each student's attendance and grades as well as the number and type of tests performed. In addition, a synopsis of the complete curriculum should be on file in the office of the laboratory director. This curriculum should include the rotation of assignments, the outline of instruction supplied by the laboratory and a list of the prepared specimens which are used to augment the experiences of the student.

4. At least two or more students should be enrolled in each class. Approval is automatically withdrawn if a school does not have any students for a period of two years, unless a satisfactory reason for this is given.

III. FACULTY

1. The school should have a competent teaching staff. The director must be a graduate in medicine who holds the certificate of the American Board of Pathology or who has had the equivalent in training and experience. He shall take part in and be responsible for the actual conduct of the training course. He shall be in daily attendance for sufficient time to supervise properly the laboratory work and teaching.

2. In laboratory practice the enrollment shall not exceed one student to each member of the teaching staff. The staff should include not less than one salaried instructor who is a registered technician or eligible for registration, in addition to the laboratory director. In order to be considered as an instructor, a

technician must have had three years of experience, while members of the hospital staff or visiting instructors must have regular assignments that cover a complete course prescribed in the Essentials.

IV. PREREQUISITES FOR ADMISSION

Candidates for admission should be able to satisfy one of the following requirements:

(a) Two years of college work, including chemistry and biology from an accredited college or university.

After Jan. 1, 1943 this requirement shall read two years of college work, including general chemistry, quantitative chemistry and biology from an accredited college or university. Bacteriology may be substituted for biology. Organic chemistry and physics are highly recommended.

(b) Graduation at a school of nursing recognized by the state board of nurse examiners and in addition college chemistry.

After Jan. 1, 1943 requirements for nurses shall include one year of college work, thirty semester hours (forty-five quarter hours), including courses in chemistry and biology.

V. CURRICULUM

1. The course of training shall be not less than twelve months in duration and shall include the following subjects: biochemistry, hematology, bacteriology, parasitology, histology and serology. The training shall also include a course in record keeping.

2. The instruction shall follow a planned outline similar to the Model Curriculum of the Board of Registry of Medical Technologists and shall be accomplished by text assignments, lectures or informal discussions, demonstrations, supervised practice, quizzes and written, oral and practical examinations.

VI. CLINICAL MATERIAL

Each student should receive practice training, adequate in kind and amount, under competent supervision, in a hospital laboratory. The hospital should be registered and be otherwise acceptable to the Council on Medical Education and Hospitals of the American Medical Association and have a minimum of two thousand yearly admissions. A sufficient amount of clinical material should be available to permit the student to comply with the requirements of the Board of Registry. If the hospital is not able to supply all of this material through its routine tests and examinations, artificial mediums should be provided.

VII. ETHICS

1. Exorbitant fees and commercial advertising shall be considered unethical.

2. Schools conducted primarily for the purpose of substituting students for paid technicians will not be considered for approval.

The report and the supplementary report of the Council were referred to the Reference Committee on Medical Education, with the exception of that part of the supplementary report dealing with intern health, which was referred to the Reference Committee on Hygiene and Public Health.

Report of Council on Scientific Assembly

Dr. James E. Paullin, Chairman, presented the report of the Council on Scientific Assembly as printed in the handbook, which was referred to the Reference Committee on Sections and Section Work.

Appointment of Reference Committee on Military Preparedness

On motion of Dr. Arthur J. Bedell, Section on Ophthalmology, seconded by Drs. Arthur T. McCormack, Kentucky, and Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, the House authorized the appointment of a Reference Committee on Military Preparedness, on which the Speaker named members as follows: Harvey B. Stone, Chairman; James E. Paullin; Sam E. Thompson; John H. O'Shea; Samuel J. Kopetzky; Edward H. Skinner, and Joseph F. Smith.

Address of Dr. T. C. Routley

The Chairman presented to the House Dr. T. C. Routley, official representative of the Canadian Medical Association, who addressed the House as follows:

Mr. Speaker, Mr. President, Mr. President-Elect, Ladies and Gentlemen: Once again it is my privilege and pleasure to bring you greetings from your brother practitioners in the Dominion of Canada. I do so on this occasion not only for those who are with us in Canada but on behalf of perhaps fifteen hundred who are no longer within our borders but are serving in forces in other lands.

Since I had the privilege of speaking to you a year ago, we have seen the world become turbulent and confused. These are days, however, when at least one profession may be expected to endeavor to keep the world on an even keel. The medical profession as a scientific body marches on; it recognizes no geographic or international boundaries; it is a profession to which mankind can look and should look for leadership and guidance and sane living. It is my hope that the medical profession of all lands will find its true place in the days to come.

I would like, sir, to express on behalf of my organization our profound thanks for the presence at our annual meeting last year of Dr. Van Etten and Dr. Cullen, who came to us, who brought us greetings, and who added materially to the success of our meeting.

I should also like to express in anticipation of his coming a most cordial welcome to Dr. Braasch, who is to visit us on your behalf at the Winnipeg meeting, and may I say to those of you who find it convenient to be in Winnipeg during the last week of June, we shall open to you our hearts and our homes and make you as welcome as you have made me for these many years.

Mr. Chairman, I shall not detain you longer other than to say a final word. I want to thank you from the bottom of my heart, and I speak for all Canadians when I say this, because we know you are our good neighbor.

NEW BUSINESS

Resolution Requesting the Appointment of a Committee to Survey the Relationship of Medicine and Law

Dr. Walter G. Phippen, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, Medical knowledge and skills have much to offer in investigations which seek to determine the cause of and the circumstances surrounding certain deaths; and

WHEREAS, The quasijudicial office of county coroner does not possess and is not qualified to exercise such knowledge and skills; and

WHEREAS, The failure to utilize such knowledge and skills seriously impairs the ends of justice; and

WHEREAS, The utilization of such knowledge and skills is essential to the public good; and

WHEREAS, The commonwealth of Massachusetts was the first community in the English speaking part of this continent to discard the archaic county coroner and substitute a system of county medical examiners; and

WHEREAS, The Massachusetts Medical Society was largely instrumental in bringing this about; be it therefore

Resolved, That (1) the Speaker of the House of Delegates of the American Medical Association shall appoint a committee of three, which committee shall be designated as this House of Delegates shall determine; (2) the committee so appointed shall survey the relationship of medicine and the law with particular reference to the manner in which this relationship is exercised in those counties which still cling to the coroner system; (3) the committee set up under this resolution shall be instructed to confer with such other committee or committees as are or will be designated by the American Bar Association, and (4) the committee created by this resolution shall make available to state medical societies all information gathered under these instructions.

Resolution Authorizing Establishment of a Health Exhibit for the Public at Cities Where Annual Sessions Are Held

Dr. William R. Molony Sr., California, presented the following resolution, which was referred to the Board of Trustees:

WHEREAS, The California Medical Association, recognizing the need of acquainting the general public with the problems of health and sound principles of medical practice, has established a policy of public health education; and

WHEREAS, Scientific exhibits constitute an effective means of acquainting the public with health problems as evidenced by the great public interest in the week-long Health Defense Exhibit in the Shrine Auditorium sponsored by the Los Angeles County Medical Association; and

WHEREAS, Such material is easily available at the time in each city in which the American Medical Association meeting is held and public interest has already been aroused by favorable newspaper publicity in relation to said convention; therefore be it

Resolved, That this House of Delegates of the American Medical Association authorize the Board of Trustees in its judgment to establish during the week immediately following the session a health exhibit for the public in each of the various cities in which the annual session of the American Medical Association is held and utilize such material from the Scientific Exhibit, to which other material may be added, which would be of interest and of educational value to the general public.

Proposed Amendment to By-Laws

Dr. O. P. J. Falk, Section on Pharmacology and Therapeutics, presented the following proposed amendment to the By-Laws, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

The Council on Scientific Assembly at its meeting held in Chicago last December endorsed the proposal that the name of the Section on Pharmacology and Therapeutics be changed to the Section on Experimental Medicine and Therapeutics. This recommendation has been included in the report of the Council on Scientific Assembly made to the House of Delegates at this session.

The Section on Pharmacology and Therapeutics therefore requests that chapter XV, section 1 be amended so that item 7 in that section shall read "7. Experimental Medicine and Therapeutics."

Resolution Requesting Appointment of Committee to Study Question of Determination of Serum Sensitivity

Dr. Walter W. Mott, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, On the occasion of a train wreck at Little Falls, N. Y., in April 1940 a number of the injured were brought in unconscious; and

WHEREAS, In making tests to determine serum sensitivity before administering tetanus antitoxin 2 cases were found; and

WHEREAS, It has been suggested that a tattoo code or other means of identification showing serum sensitivity might be devised to safeguard unconscious accident patients; and

WHEREAS, The Medical Society of the State of New York considers the subject deserving of national consideration; therefore be it

Resolved, That a committee of the American Medical Association study this question and report to this House in 1942.

Resolution Requesting Appointment of Committee to Confer with Specialty Boards

Dr. L. G. Christian, Michigan, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

Report of the Committee on Distribution of Medical Care Presented to the Michigan State Medical Society House of Delegates, Sept. 24, 1940:

Arising out of the discussion of the report of the committee on distribution of medical care, the following points seem clear:

1. It is recognized that not all qualified physicians have been certified by a specialty board.

2. It is also recognized that the opportunities for formal academic preparation for certification by these boards are very limited, and, further, that the value of experience has not always been given adequate consideration.

To correct the above mentioned faults in the existing situation, the reference committee offers the following resolution, which was adopted by the house of delegates of the Michigan State Medical Society:

WHEREAS, Now as never before, this country needs the concerted effort and wholehearted cooperation of American physicians; and

WHEREAS, Certification by specialty boards is being arbitrarily taken by government agencies as an imperative requirement for performance of many medical services paid for by government funds; and

WHEREAS, Such work is increasing in amount and importance; and

WHEREAS, This policy works a hardship on many qualified physicians by excluding them from such work; therefore be it

Resolved, That the Michigan delegates to the American Medical Association be instructed to propose to the House of Delegates of the American Medical Association that a committee of that House be created to confer with specialty boards, national organizations of specialists and government agencies to effect some equitable adjustment of these difficulties and remove this potential source of dissension in the ranks of American medicine.

Resolution on Eligibility of Women Physicians and Surgeons for Medical Reserve Corps

Dr. Emily D. Barringer, New York, presented the following resolution, which was referred to the Reference Committee on Military Preparedness:

WHEREAS, The United States of America is at present engaged in a vast preparedness program which includes a listing of members in the Medical Reserve Corps available for active service; and

WHEREAS, There are approximately eight thousand women physicians and surgeons in the United States, and women physicians and surgeons of America demonstrated their fitness for wartime service during the first World War when they financed units and staffed hospitals with well trained officers, in France and Serbia; and

WHEREAS, The United States government has to date taken no cognizance of these women physicians in time of national emergency; and

WHEREAS, The government has already granted women nurses Army rating with proper rank, pay, and war risk insurance; and

WHEREAS, The Medical Society of the State of New York has gone on record recommending that the women physicians and surgeons of America be made eligible for the Medical Reserve Corps of the United States Army and Navy and be granted full privileges thereof; therefore be it

Resolved, That the American Medical Association go on record to this effect and that a request go to the Surgeon Generals of the Army and Navy to make women physicians and surgeons of the United States eligible for the Medical Reserve Corps of Army and Navy with full privileges thereof.

Resolutions on Specialists

Dr. Thomas A. McGoldrick, New York, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, At the regular meeting of the Kings County Medical Society held March 19, 1940 the following resolution was introduced and passed unanimously; be it

Resolved, That in order to serve better the hospitals with which they are connected and to improve that service by greater cooperation and understanding, the Joint Council of Pathologists, Radiologists, Anesthesiologists and Physical Therapy Physicians recommends that all hospitals approved for medical training for interns shall have physicians especially trained in pathology, radiology, anesthesiology and physical medicine in charge of these respective departments and that the directors of these departments shall be members of their respective medical boards or their equivalent, with voice and vote; and

WHEREAS, At the meeting of the Kings County Medical Society the delegates to the Medical Society of the State of New York were instructed to present and support the foregoing resolution; therefore be it

Resolved, That in those communities in which the aforementioned specialties are not represented by specialists it shall be permissible for physicians trained in these specialties to represent the specialty on their respective medical boards or their equivalents; and be it

Resolved, That the house of delegates of the Medical Society of the State of New York at its regular session of May 6, 1940 does hereby approve this resolution; and be it further

Resolved, That this resolution be presented to the House of Delegates of the American Medical Association at its next meeting in New York City, in June 1940.

Resolutions Requesting Appointment of Committee to Confer with Committees of Hospital Associations

Dr. Harry H. Wilson, California, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, In the drafting of policies or contracts to cover medical and hospitalization services of nonprofit and other prepayment organizations it is of primary importance that the agreements or contracts shall make a clear differentiation of medical and hospitalization services that will permit physicians who give pathologic laboratory, x-ray laboratory, anesthesia or similar services, to maintain their physician-patient relationship and their own status as physician specialists; and

WHEREAS, In many plans designed to promote more adequate service among lower income groups of citizens it has seemingly been difficult to maintain the necessary professional distinctions concerning such medical work, and the ways and means whereby compensation shall be made therefor; now therefore be it

Resolved, That the California Medical Association through its constituted authorities herewith requests the House of Delegates of the American Medical Association to instruct the Board of Trustees of the American Medical Association to appoint a committee of such number as may be deemed advisable to confer with similar committees representing the American Hospital Association and the Catholic Hospital Association of the United States, the conjoint committees to study and submit reports to their respective national bodies, in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in prepayment hospitalization and similar plans, the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association; and be it further

Resolved, That the Board of Trustees be requested to proceed in these matters as expeditiously as may be possible, and to submit the com-

mittee's report, with such suggestions and/or recommendation that the Board of Trustees may wish to attach thereto, at the next annual session of the American Medical Association, the Board of Trustees to be authorized in the interim to advise the constituent state associations of the American Medical Association concerning tentative or other agreements that may have been reached.

Resolution Requesting the Creation of a Section
on General Practice

Dr. Henry A. Luce, Michigan, presented the following resolution, which was referred to the Reference Committee on Sections and Section Work:

WHEREAS, Sixty-six and two-thirds per cent of the doctors of medicine of this nation are general practitioners, and these general practitioners constitute the bulk of the membership of the American Medical Association; and

WHEREAS, General practice is an entity of and by itself within the profession, is definite in its comprehension and is limitless in its extension; and

WHEREAS, The organized specialty groups have set up certain restrictive rules and regulations concerning important portions of the field of general practice, which rules and regulations cannot be met and surmounted in the aggregate by the physicians who are making general practice their life work; and

WHEREAS, Forty per cent of surgery and 50 per cent of obstetrics are efficiently performed by well trained general practitioners; and

WHEREAS, Efforts to date looking toward the creation of an official section of general practitioners in the American Medical Association have met with disapproval and no sufficiently good reasons have been advanced for denying the general practitioners this vital means by which they can help themselves to face and solve their own particular problems; and

WHEREAS, General practitioners are constantly engaged in continuation study to increase their proficiency along practical lines and are developing more suitable programs of clinical study, as is evidenced by statistics from one section of the country which shows that 60 per cent of those in attendance at postgraduate courses are general practitioners; and

WHEREAS, No place has been provided on hospital staffs through which general practitioners would be enabled to submit their evidence of special training in certain fields of medicine and surgery which would qualify them before the public as proficient therein; and

WHEREAS, General practitioners have a special interest in medical legislation, administration and jurisprudence which justifies their particular voice being officially heard; and

WHEREAS, It is not the desire of the general practitioner to disrupt the splendid variety and caliber of scientific programs of the American Medical Association but rather to create a new and proper basis for separate registration, representation and participation in the general activities of the organization; and

WHEREAS, The general practitioners have original contact with the great majority of all patients; and

WHEREAS, The people of the United States will be inclined to view with favor and good will the official recognition of their family physicians as a distinct part of the American Medical Association; and

WHEREAS, The specialty fields are overcrowded with general practitioners classified as specialists only because there is no proper classification for them; and

WHEREAS, The establishment of an official Section on General Practice in the American Medical Association will stimulate a more active interest and cooperative attitude among the profession generally, making for greater unity in the advancement of the organization's programs; and

WHEREAS, The Council of the Wayne County (Mich.) Medical Society has gone on record as endorsing the introduction of this resolution for the creation of a Section on General Practice of the American Medical Association; and

WHEREAS, The Michigan State Medical Society has approved the introduction of resolutions at this meeting looking toward the expansion of hospital staff privileges for general practitioners throughout the country; therefore be it

Resolved, That the House of Delegates of the American Medical Association take whatever action is proper at this time to create as soon as possible a new Section on General Practice to be duly constituted of equal rank and authority with the other sections already established.

Resolution on Hospital Privileges for General
Practitioners

Dr. C. R. Keyport, Michigan, presented a resolution dealing with hospital privileges for general practitioners, which was referred to the Reference Committee on Miscellaneous Business.

Resolution on Continuation of Supply of Well
Trained Medical Graduates

Dr. Louis H. Bauer, New York, presented a resolution concerning the deferment of medical students, which was read by title and referred to the Reference Committee on Military Preparedness.

Communication Concerning Uncompensated Services
Rendered by Physicians to the Selective Service

Dr. Edward E. Barlow, Arkansas, presented by title a communication concerning uncompensated services rendered by physicians to the Selective Service, which was referred to the Reference Committee on Military Preparedness.

Resolution on Medical Examination of Draftees

Dr. T. K. Gruber, Michigan, presented by title a resolution on Medical Examination of Draftees, which was referred to the Reference Committee on Military Preparedness.

Resolution on Patriotic Services of Native American
and Foreign Born Physicians

Dr. Samuel J. Kopetzky, New York, presented by title a resolution dealing with patriotic services of native born and foreign born physicians, which was referred to the Reference Committee on Military Preparedness.

The House recessed at 12:45 p. m. to reconvene at 9:30 a. m., Tuesday, June 3.

(To be continued)

REGISTRATION AT CLEVELAND

The total registration at Cleveland was 7,269. Below are summaries of the registration by sections and by states:

Registration by Sections	
Practice of Medicine.....	2,440
Surgery, General and Abdominal.....	1,147
Obstetrics and Gynecology.....	432
Ophthalmology	281
Laryngology, Otolology and Rhinology.....	257

MEDICAL LEGISLATION

STATE MEDICAL LEGISLATION

Florida

Bills Introduced.—H. 1626 proposes to establish in Dade County the office of county medical examiner. The county medical examiner must be a graduate of some recognized school of medicine and surgery and licensed to practice in the state. It is proposed to confer on the county medical examiner the authority and duties generally conferred in other states on coroners. H. 1636 proposes to establish the office of county medical examiner in all counties having a population of more than 267,000. The jurisdiction proposed to be conferred on the county medical examiner in such counties is similar to the jurisdiction proposed in H. 1626.

Bill Passed.—H. 1556 passed the House, May 27, proposing to establish a public hospital district in Broward County to provide free of cost necessary hospital care and medical treatment to indigent residents of the county. Such care and treatment may be rendered to persons who are not paupers for a reasonable compensation for occupancy, nursing, care, medicine and attendance, according to the rules and regulations to be prescribed by the board of trustees of the hospital district.

Illinois

Bills Introduced.—S. 641 proposes to prohibit the retail sale and distribution of barbital except on the written prescription of a licensed physician, dentist or veterinarian. The bill states that "Barbital" includes diethyl-barbituric acid, barbital sodium, and all compounds containing barbital, barbituric acid, barbital sodium, or any derivative of any of them, whether in crystalline, liquid, or other form, which are, or may be used internally as pain-killers, soporifics, or for other purposes." H. 910 proposes to authorize the Department of Public Health, through its Division of Cancer Control, to formulate policies, establish standards and regulations, prescribe schedules and terms of payment, and specify the conditions under which indigent cancer patients may be provided with care and treatment at governmental expense. The bill proposes to authorize the department to acquire such equipment and other materials and to hire such personnel as may be necessary to carry out the purpose of the bill. The bill proposes to appropriate \$200,000 to the department for these purposes. H. 911 proposes to create a Committee to Investigate Chronic Diseases among indigents to make a thorough survey of the number of persons in indigent circumstances in the state afflicted with chronic diseases who are not already provided for in existing state institutions and to submit recommendations to the sixty-third general assembly, when it convenes, accompanying the recommendations with appropriate legislative proposals to provide for the construction, equipment and operation of such institution or institutions as the committee may determine to be necessary.

DISTRICT OF COLUMBIA

Bill Introduced.—S. 1593, introduced by Senator McCarran, Nevada, provides that certain buildings and grounds of hospitals in the District of Columbia and occupied and used by the hospitals for legitimate hospital purposes shall be exempt from all national and municipal taxation.

MEDICAL BILLS IN CONGRESS

Changes in Status.—H. R. 4926 has passed the House, making appropriations for the Department of Labor, the Federal Security Agency and related independent agencies, for the fiscal year ending June 30, 1942. This bill, among other things, authorizes an appropriation of \$1,235,000 to enable the United States Public Health Service to assist state and local health authorities in health and sanitation activities (1) in areas adjoining military and naval reservations, (2) in areas where there are concentrations of military and naval forces, (3) in areas adjoining government and private industrial plants engaged in defense work and (4) in private industrial plants engaged in defense work. This appropriation, too, may be utilized to provide emergency health and sanitation services in government industrial plants engaged in defense work and in areas adjoining United States military and naval reservations outside of the United States. The bill furthermore appropriates \$1,200,000 to be utilized by the United States Public Health Service for the cost, including subsistence but not cash allowances to trainees, of refresher, student nurse and postgraduate nursing courses, including courses in midwifery. H. R. 4965 has been passed by the House, making appropriations for the military establishment for the fiscal year ending June 30, 1942. As reported, this bill provided, among other things, for an appropriation for the employment of interns at not to exceed \$720 per annum each. On the floor of the House an amendment was adopted providing for the employment of interns, at \$720 per annum, who are graduates or have successfully completed at least four years' professional training in reputable schools of medicine or osteopathy. Another amendment appropriates "such additional sum as the Surgeon General [of the army] may determine to be necessary for assisting financially civilian schools on account of student nurses undergoing training therein for duty in army hospitals and for assisting such student nurses."

Bill Introduced.—S. 1546, introduced by Senator McNary, Oregon, relates to the production of poppies for seed purposes only. This bill provides that no person who produces opium poppies shall, by reason of the production of such poppies, be deemed for the purposes of any Act of Congress to be a producer of opium or any derivatives thereof, or of any other narcotic substance, if he complies with the regulations prescribed by the Secretary of Agriculture. The bill provides that the Secretary of Agriculture shall prescribe regulations (1) providing that any person who seeds land to opium poppies shall file with the Secretary, or his representative, at such time or times as may be fixed by such regulations, a report or reports showing the area and location of the land seeded by him to such poppies; (2) prohibiting the collection or extraction from such poppies of any opium, morphine or other narcotic substance; (3) providing for such utilization and disposition of every part of the poppy plants by the producer of any such poppies in such manner as will, in the opinion of the Secretary, prevent the extraction or collection of narcotic substances therefrom, and (4) providing that the producer of any such poppies shall make such reports, under oath, with respect to the utilization and disposition of every part of the poppy plants as may be required by the Secretary.

WOMAN'S AUXILIARY

Indiana

On February 3 and 4 the regional meeting of the Women's Field Army for Cancer Control met in Indianapolis with the national auxiliary president, Mrs. V. E. Holcombe, of Charleston, W. Va., present. Accompanying her was Mrs. A. A. Seletz, also of Charleston, and the program chairman for the West Virginia state auxiliary. A luncheon in their honor was given February 3 in the Indianapolis Athletic Club.

The Woman's Auxiliary to the Indiana State Association has added a new group to its organization, La Porte County. This new auxiliary chose Mrs. F. M. Fargher, of Michigan City, as president.

The legislative committee provided the program for the Marion County auxiliary, January 6. Dr. Norman Beatty and Mr. Thomas A. Hendricks discussed medical legislation pending in the state legislature. Fifty-one members attended the meeting.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Orchestral Society.—Physicians and dentists have joined in organizing the Medical Arts Orchestral Society in Los Angeles. William R. Bergren of the California Institute of Technology, Pasadena, is the conductor, and rehearsals take place every Thursday night in the auditorium of the Cedars of Lebanon Hospital. Interested persons are requested to communicate with Dr. Fred Lindenberg, secretary of the society.

Santa Monica Hospital Transferred.—The Santa Monica Hospital, Santa Monica, will be turned over to the California Hospital, operated by the Lutheran Hospital Society of Southern California, Los Angeles, Jan. 1, 1942. The transfer will fulfil the plans of Dr. William S. Mortensen, president and medical superintendent of the Santa Monica Hospital, to convert his profit corporation into a nonprofit charitable institution for the citizens of Santa Monica. The gift includes the one hundred and fifty bed Santa Monica Hospital and adjoining property and the Loamshire Convalescent Home, with a capacity of thirty beds, and will serve to create a memorial to Dr. August B. Hromadka and Dr. Mortensen. The widow of Dr. Hromadka is participating in the transaction. The administration of the Santa Monica Hospital, which will be converted into a two hundred bed institution, will be carried out under a foundation, the creation of which is now being negotiated. The present medical staff will continue and the two hundred workers at the hospital will be retained.

CONNECTICUT

Yale Dedicates New Library Building.—The dedication and opening of the new Yale Medical Library, New Haven, will take place June 15. The ceremony will open with an introduction by Wilmarth S. Lewis, chairman, the Yale Corporation's Committee on the Library and Museum. A feature will be the presentation of a gift for the rotunda from the class of 1891 in memory of Dr. Harvey Cushing, New Haven. Starling W. Childs, a member of the class, will make the presentation and Charles Seymour, LL.D., president of the university, will accept the gift for the university and Dr. Francis G. Blake, dean, for the school of medicine. Dr. John Homans, clinical professor of surgery, Harvard Medical School, Boston, will give the address and Rev. George Stewart, minister of the First Presbyterian Church, Stamford, will deliver the benediction. The new building was made possible through an appropriation of \$600,000 from the estate of John W. Sterling, who graduated at Yale in 1864. It is located on the grounds of the Yale University School of Medicine and is designed as an extension to the library wing of the Sterling Hall of Medicine. The building is Y-shaped and combines facilities for studies based on the history of medicine and the medical sciences with those for more strictly professional study for the practice of medicine and the prosecution of medical research. The Historical Library, of which the nucleus is the recently acquired Cushing collection, is in one branch of the Y and the General Medical Library in the other, with separate reading rooms for each. The Beaumont Room, in which will be displayed items from the Beaumont Collection, will be located centrally on the second floor. This room will also serve for lectures, seminars and meetings. The building will provide offices and studies. With its stack rooms and bookshelves on all floors it will be capable of housing upward of 400,000 volumes, providing space to meet future growth. There is also provision for a well equipped photographic laboratory and for storage of films.

ILLINOIS

Society News.—Dr. Willard C. Scrivner, East St. Louis, discussed "Management of Placenta Praevia and Premature Detachment of the Placenta" before the Madison County Medical Society in Collinsville, April 4.—Dr. Clinton W. Lane, St. Louis, discussed "Contact Dermatitis" before the Peoria Medical Society, April 15.—The Sangamon County Medical Society was addressed in Springfield, May 1, by Drs. Millard F. Arbuckle and Brian B. Blades, both of St. Louis, on "Lung Abscess from the Standpoint of the Bronchoscopist" and "Pulmonary Resection" respectively.—Dr. William Thompson, St. Louis, discussed "Management of Acute Abdominal Emer-

gencies" before the Adams County Medical Society, Quincy, April 14.—Dr. Charles E. Galloway, Evanston, discussed "Pathology of the Cervix" before the Rock Island County Medical Society, May 13, in East Moline.

Zoologist Joins Illinois Staff.—Carl G. Hartman, Ph.D., research associate in embryology of the Carnegie Institution of Washington, Johns Hopkins University School of Medicine, Baltimore, has been appointed professor of zoology and head of the departments of zoology and physiology at the University of Illinois, Urbana, effective September 1. *Science* reports that a consolidation of the two departments is anticipated. Victor E. Shelford, Ph.D., professor of zoology at Illinois, will continue his research with a reduced teaching load, it was stated. Dr. Hartman received his degree of doctor of philosophy at the University of Texas in 1915.

Chicago

Branch Societies.—Dr. George H. Gardner discussed "Differential Diagnosis and Management of Leukorrhea" before the Northwest Branch of the Chicago Medical Society, April 18, and Dr. Chauncey C. Maher, "Management of Cardiac Edema." Dr. Cleveland J. White addressed the Calumet Branch, April 18, on "Common Skin Disorders and Their Modern Management." Among others, Drs. LeRoy H. Sloan and Chester C. Guy addressed the Jackson Park Branch, April 17, on "Spinal Cord Tumor" and "A Common Error in Diagnosis of Appendicitis in Women." Dr. Willard O. Thompson discussed "Sex Hormones: Clinical Application" before the West Side Branch, April 17. The Stock Yards Branch was addressed, April 17, by Drs. Ben Z. Rappaport on "Allergy in Infants and Children" and Francis E. Senear, "Common Skin Disorders in Infants and Children." Dr. Adolph Hartung addressed the North Shore Branch, May 6, on "Abdominal Tumors of Questionable Origin" and Drs. Jay M. Garner, Winnetka, and Jerrold P. Nesselrod, Evanston, "Cinematographic Proctoscopy in Color."

New Publication Committee.—The president of the University of Chicago has appointed five members of the faculty to a committee on biology and medicine to further the publication through the University Press of books in the field of medicine and the biologic sciences. Members of the committee are William H. Taliaferro, Ph.D., dean of the Division of Biological Sciences and chairman of the department of bacteriology and parasitology and Eliakim H. Moore distinguished service professor of parasitology; Drs. Franklin C. McLean, professor of pathologic physiology; Charles Phillip Miller, associate professor of medicine; Lester R. Dragstedt, professor of surgery, and Thomas Park, Ph.D., assistant professor of zoology. The committee will advise the University of Chicago Press of research suitable for publication, will plan needed texts and will act as a possible outlet for valuable work now being done throughout the country in the biologic and medical fields. In the matter of securing manuscripts, the committee will be assisted by an advisory group, one man from each department of the biologic sciences at the university. Appointments to the newly formed committee are for five years. It replaces the committee on medical monographs.

INDIANA

First Year of Premarital Examinations.—A report on the first full year of operation of Indiana's premarital blood test law showed that positive results were obtained in tests for syphilis in 1.6 per cent of marriage license applicants, newspapers reported April 18. In the twelve months dating from March 1, 1940, when the law became effective, 64,913 tests were made; of these 1,098 showed positive syphilis reactions. The report shows that 31,038 tests were made on pregnant women with 450 having positive reactions. In the United States Army selective service group from Indiana 33,017 serologic tests were made and 321, or 3.8 per cent, showed positive reactions, newspapers stated.

District Meetings.—Physicians of the Sixth Councilor District met in New Castle, May 16, to hear, among others, Lieut. Col. Irving H. Willett, Fort Wayne, discuss "The Army Medical Service and the Doctor."—At a meeting of the Ninth Councilor District Medical Society in Frankfort, May 22, Dr. Arthur F. Weyerbacher, Indianapolis, addressed the banquet session on "Romance and Venereal Disease."—Speakers before the Tenth Councilor District Medical Society in Gary, May 14, included Dr. Samuel Feinberg, Chicago, on "Allergy of the Nose."—The Eleventh Councilor District Medical Society was addressed in Kokomo, May 21, among others, by Dr. William R. Cubbins, Chicago, on "Chest Injuries, Abdominal Injuries and Fractures of the Extremities."

IOWA

Twin Lakes District Meeting.—The eighteenth annual assembly and dry diagnostic clinic of the Twin Lakes District Medical Society will be held at Rockwell City June 19, under the presidency of Dr. John R. Christensen, Eagle Grove. Dr. Roy W. Fouts, Omaha, will open the program with a talk on the "Art of Medicine." The following will conduct clinics:

Dr. Charles C. Dennie, Kansas City, Mo.
Dr. Archibald Ross McIntyre, Omaha.
Dr. Gordon B. New, Rochester, Minn.
Dr. Waltman Walters, Rochester.
Dr. George E. Fahr, Minneapolis.

Dr. Carl M. Peterson, Secretary, Council on Industrial Health, American Medical Association, Chicago, will conclude the day's program with an address entitled "The Private Practitioner and Industrial Preparedness."

KENTUCKY

Donates Library for Negro Physicians.—Dr. August Schachner, Louisville, has given a collection of 1,000 medical volumes for the use of Negro physicians. The library is housed in the Western Colored Library under the care of the Louisville Free Public Library in a special Schachner Memorial Room. Dr. Schachner, now 80 years old, made the presentation, and addresses were made by Drs. Rettig Arnold Griswold, professor of surgery, University of Louisville School of Medicine; Orville L. Ballard, Waverly Hills, secretary of the Falls City Medical Association, and Coleman Milton Young Jr., director of the Central Louisville Health Center, among others. Letters were read from Drs. Arthur T. McCormack, secretary of the Kentucky State Medical Association, and Irvin Abell, former president of the American Medical Association, both of Louisville.

MAINE

State Medical Meeting.—The eighty-ninth annual session of the Maine Medical Association will be held at the Marshall House, York Harbor, June 22-24, under the presidency of Dr. Thomas A. Foster, Portland. The scientific program has been divided into conferences covering the following topics: traumatic surgery, cardiac lesions, obstetrics, otolaryngologic pediatrics and surgery. A symposium on vascular and arterial diseases will be presented by Drs. Laurence B. Ellis, Burton E. Hamilton and Reginald H. Smithwick, all of Boston. There will also be a symposium on problem fractures. Among the speakers on the program will be:

J. Ernestine Becker, D.Sc., specialist in nutrition, Children's Bureau, U. S. Department of Labor, Washington, D. C., "The Vitamins, What They Are, What They Do for You, and Where You Get Them."
Dr. John F. Holmes, Manchester, N. H., "A Study of the Slipping Rib Cartilage Syndrome."
Dr. Henry B. Elkind, Boston, "Practical Aspects of the Modern Mental Hygiene Movement."
Dr. William Dameshek, Boston, "The Spleen: Facts and Fancies."
Dr. Arthur W. Allen, Boston, "Gastric Ulcer and Its Relationship to Cancer."

At the dinner Monday evening "fifty year" medals will be presented to the following: Drs. Lindley Dobson, Presque Isle; Willey Edgar Sincock, Caribou; William H. Bradford, Portland; George A. Gregory, Boothbay Harbor; Nathaniel H. Crosby, Milo, and Ernest A. White, Columbia Falls. The annual dinner Tuesday evening will be addressed by Gov. Sumner Sewall and Dr. Frank H. Lahey, Boston, President of the American Medical Association.

MINNESOTA

Osteopath's Eight Year Sentence Upheld.—On April 10, 1941 the Supreme Court of Minnesota upheld the sentence of not to exceed eight years at hard labor imposed by Judge Kenneth G. Brill of the Ramsey County District Court on May 13, 1940 on Samuel M. Stern, St. Paul osteopath, under the state habitual criminal act. Stern pleaded guilty to an information charging him with the crime of abortion. The prior offense alleged, which resulted in the double sentence authorized under the habitual criminal act, was Stern's conviction of embezzlement Jan. 3, 1922 by a jury in Orange County, Calif. He served one year in the San Quentin prison and was then paroled. In September 1938 he obtained a pardon from former Governor Merriam of California "in order to restore his citizenship." Stern claimed in the present case that having been pardoned by the governor of California he could not be given a double sentence by Judge Brill in the abortion case. However, the supreme court of Minnesota upheld Judge Brill and pointed out that the legislature had not excepted pardoned prior criminal offenses from the habitual criminal law of this state and, therefore, Stern was properly sentenced by Judge Brill to a term of not to exceed eight years at hard labor.

MONTANA

State Medical Meeting in Great Falls.—The Medical Association of Montana will hold its sixty-third annual session in Great Falls June 23-25, under the presidency of Dr. James I. Wernham, Billings. The preliminary program lists the following speakers:

Dr. Emile F. Holman, "Carcinoma of the Lung—Its Early Diagnosis and Treatment; Carcinoma of the Stomach—Its Early Diagnosis and Treatment by Aseptic Resection of the Stomach."
Dr. Donald E. King, "Fracture of the Spine—Its Treatment and Complications; Fracture of the Upper Extremity."
Dr. Charles W. Barnett, "Massive Dose Arsenotherapy in the Treatment of Syphilis; Prognosis and Treatment of Late Syphilis of the Cardio-vascular System."
Dr. Davis A. Ryland, "Management of Hypertension; Interpretation of the Newer Laboratory Methods."
Dr. Maurice L. Tainter, "Chemotherapy, Including the Sulfanilamide Group; Practical Applications of the Sympathetic Drugs, Including Benzedrine."

Dr. Tainter will address the banquet Tuesday evening. All are members of the faculty of Stanford University School of Medicine, San Francisco. Sessions will be held by the Montana Academy of Oto-Ophthalmology, June 22-23, and the Montana Public Health Association, June 26-27.

NEW MEXICO

Health in New Mexico.—The biennial report of the state department of public health, covering 1939-1940, shows that tuberculosis continues to be a major problem. From one half to two thirds of the cases originate outside the state, but it is said that tuberculosis among the native born is increasing as a result of their contact with health seekers. With the highest infant mortality rate in the United States reported for New Mexico, the health department has emphasized this subject, pointing out the 109 centers for maternal and child health clinics or conferences as community projects. Special instruction and supervision has been given to midwives and post-graduate instruction provided for physicians and nurses. In San Miguel County a demonstration unit has been established with funds provided by the Social Security Act. A nutrition program was started in January 1940 with federal funds, and a state nutrition council has been formed. Typhoid has declined since 1935; in 1940 there were 142 fewer cases than the average for the five preceding years. In 1935 there were 436 cases with 47 deaths. A pneumonia control program was operated from January to June 1940, during which time serum and sulfapyridine were provided without cost to patients unable to pay for them. A cancer control program, largely educational, was started at the beginning of the present fiscal year. In 1939 the state had 107 cases of poliomyelitis, the largest number reported during the past ten years. Selective service examinations taxed the public health laboratory from November through December 1940 with serologic tests for the diagnosis of syphilis; 2,210 specimens were examined, of which 95 gave evidence indicative of infection. An epidemic of rabies among dogs and other animals has been prevalent in the two years, the report says; in 1940 there was one human death from rabies. Demands for birth certificates as a result of the national defense effort placed a heavy burden on the division of vital statistics. A table showing major causes of death for 1939 gave the following rates per hundred thousand of population: heart disease 125.3, influenza and pneumonia 116.6, accidents 97.6, congenital malformations and diseases of infancy 81.8, tuberculosis 81.2, cancer 60.8, diarrhea and dysentery 58.9, nephritis 49.3, cerebral hemorrhage 47.3 and puerperal causes 15.2.

NEW YORK

Meeting of School Physicians.—The New York State Association of School Physicians will hold its annual meeting and conference at the Grand Union Hotel, Saratoga Springs, June 23. A program has been arranged of interest to school physicians, health officers and general practitioners.

Hospital News.—New York Hospital-Westchester Division, White Plains, opened a new building for acutely ill women patients in March. The building, which has space for twenty beds, is called the Nichols Memorial Cottage in memory of Dr. Charles H. Nichols, superintendent of the hospital from 1877 to his death in 1889.

Cornerstone Laid for Science Building.—The cornerstone of the new Edward Bausch Hall of Science and History, the gift of Edward and Matilda Bausch to the Rochester Museum of Arts and Sciences, was laid recently. Robert A. Millikan, Ph.D., director of the Norman Bridge Laboratory of Physics and chairman of the executive council, California Institute of Technology, Pasadena, was the principal speaker.

Health Officers' Conference.—The annual Conference of Health Officers and Public Health Nurses will be held at Saratoga Springs, June 24-26. The provisional program announces the following speakers, among others:

Dr. Soma Weiss, Boston, Heart Disease.
Dr. Russell M. Wilder, Rochester, Minn., Nutrition—A Public Health Problem.
Dr. Lawrence Kolb, U. S. Public Health Service, Washington, D. C., Alcoholism and Public Health.
Dr. Harry S. Mustard, New York, Trends in Public Health Administration.
William F. Wells, Philadelphia, Radiant Disinfection of Air.
Dr. Herbert A. Spencer, U. S. Public Health Service, Philadelphia, Health Conditions in Germany.

New York City

Grant for Public Health Teaching.—Cornell University Medical College has received a grant of \$600,000 from the Rockefeller Foundation for the endowment of the department of public health and preventive medicine. The department has been receiving an annual grant of \$28,000 for the past five years. The endowment will enable the college to expand its teaching in public health, it was said.

Columbia Alumni Meeting.—The Alumni Association of Columbia University College of Physicians and Surgeons held its annual meeting, May 6, at the De Lamar Institute of Public Health. A symposium on "What's New in Public Health" was presented by Dr. Harry Stoll Mustard, John W. Fertig, Ph.D., Frederick B. Flinn, Ph.D., Moses L. Isaacs, Ph.D., Dr. Ernest L. Stebbins and Prof. Earl B. Phelps. The annual dinner was held at the Hotel George Washington in the evening with Professor Phelps presiding and the following speakers: Dr. John L. Rice, city commissioner of health, Leonard J. Piccoli, Ph.D., and Dr. Mustard.

Brooklyn Medical Library.—In the Library of the Medical Society of the County of Kings and the Academy of Medicine of Brooklyn the number of books consulted increased from 63,665 in 1939 to 68,656 in 1940, while the number of books taken home decreased from 13,594 to 12,765. The number of current periodicals and serial publications on file was 1,459, but because of conditions abroad the library was actually receiving at the close of the year about 1,230. Financial support for the Brooklyn library is derived from the general funds of the society, from special societies that meet in the building, from other Brooklyn organizations, from health and welfare organizations and from many individual donors.

Society News.—Drs. Victor W. Eisenstein, Pittsburgh, Emanuel D. Friedman and Charles Davison addressed a combined meeting of the New York Neurological Society and the section of neurology and psychiatry of the New York Academy of Medicine, May 6, on "Brain Abscess of Uncommon Origin: Relation to Osteomyelitis of the Skull" and Dr. Leo Alexander, Boston, on "Electrical Injuries of the Central Nervous System."—A symposium on "sclerosing therapy" was presented before the Bronx County Medical Society, April 16, by Drs. Grant P. Pennoyer, Frank C. Yeomans, New York, and Daniel C. Patterson, Bridgeport, Conn.—Dr. William Cook Spain addressed the Academy of Pathological Science, May 2, on "Hypersensitiveness to Common Foods."—Drs. Thomas A. Shallow, Philadelphia, and James Murray Flynn, Rochester, addressed the Medical Society of the County of Kings, Brooklyn, April 15, on "The Surgical Aspects of Peptic Ulcer" and "The Individual Physician's Obligation to Medical Organization" respectively.

Dr. Knapp Awarded Medal.—The Leslie Dana Gold Medal, awarded annually for outstanding achievements in the prevention of blindness and the conservation of vision, will be presented this year to Dr. Arnold Knapp, formerly professor of ophthalmology at Columbia University College of Physicians and Surgeons. The medal is given by Mr. Leslie Dana of St. Louis through the St. Louis Society for the Blind and on the recommendation of the Association for Research in Ophthalmology. Dr. Knapp was born in New York in 1869 and graduated at Columbia University College of Physicians and Surgeons in 1892. He was professor of ophthalmology at his alma mater from 1903 to 1928. He was executive surgeon at the Herman Knapp Memorial Hospital until it merged last year with the Institute of Ophthalmology of the Columbia-Presbyterian Medical Center. For a number of years he has been editor of the *Archives of Ophthalmology*. He was also chairman of the Section on Ophthalmology of the American Medical Association, 1925-1926, a position held by his father, the late Dr. Herman Knapp, from 1878 to 1880. The American Ophthalmological Society awarded Dr. Knapp the Lucien Hove Medal in 1937.

NORTH CAROLINA

State Medical Meeting and Election.—Dr. Donnell B. Cobb, Goldsboro, was chosen president-elect of the Medical Society of the State of North Carolina at its annual meeting in Pinehurst May 2. Dr. Franklin W. Griffith, Asheville, was installed as president. Other officers include Drs. Thomas D. Sparrow, Charlotte, and Thomas L. Carter, Gatesville, vice presidents, and Roscoe D. McMillan, Red Springs, secretary-treasurer. The 1942 meeting will be in Charlotte. Speakers who addressed general sessions were:

Dr. Frank H. Lahey, Boston, President of the American Medical Association, Developments in Medicine, Economic and Scientific.
Dr. Louis H. Clerf, Philadelphia, Tumors of the Larynx and Hypopharynx.
Dr. Thomas M. Watson, Greenville, Appendicitis in Small Children.
Dr. James Watson, Raleigh, The Medical Profession and the Problem of Mental Disorder.
Dr. Wilburt C. Davison, Durham, The First Ten Years of Duke University School of Medicine and Duke Hospital (McBrayer Memorial Lecture).
Dr. James W. Tankersley, Greensboro, Surgical Aspects of Splenic Disease.
Dr. William T. Rainey, Fayetteville, Management of Congestive Heart Failure.
Major Elmus D. Peasley, Raleigh, The Physical Status of the Selective Service Drafttees.
Dr. Charles Hampton Mauzy Jr., Winston-Salem, Cesarean Section, Incidence and Fetal Mortality in Some Cities in North Carolina.

The North Carolina Public Health Association held its annual meeting May 19, with Dr. Harry Stoll Mustard, New York, as guest speaker on "Relationships in State and Local Public Health Work."

OHIO

New Medical Supervisor for Industrial Commission.—Dr. Henry P. Worstell, Columbus, who has been assistant supervisor of the medical section of the State Industrial Commission, has been appointed supervisor. He succeeds Dr. Sidney M. McCurdy, Columbus, who resigned.

Personal.—Dr. Chester A. Spitzer, Middletown, has been named health commissioner of the town to succeed the late Dr. George D. Lummis.—Dr. Alfred P. Cole, Cincinnati, has been appointed medical director of the Hamilton County Home and Chronic Disease Hospital, Cincinnati, to succeed Dr. Miles J. Scott, it is reported.—Dr. George F. Zinninger, Canton, was guest of honor at the annual dinner of the Canton Academy of Medicine recently, celebrating his completion of fifty years in the practice of medicine.

Society News.—Dr. Walter L. Dandy, Baltimore, addressed the Academy of Medicine of Cincinnati, April 15, on "Diagnosis and Treatment of Lesions of the Cranial Nerves." Dr. John de J. Pemberton, Rochester, Minn., was the speaker, April 29, on "Present Status of Surgery of the Spleen."—Dr. Warren T. Vaughan, Richmond, Va., addressed the Academy of Medicine of Cleveland, May 16, on "Allergy and Its Relation to Chronic Diseases." The academy orchestra gave its spring concert in Severance Hall, May 10, for the benefit of the Health Education Foundation.—Dr. John A. Toomey, Cleveland, addressed the Mahoning County Medical Society, Youngstown, May 20, on "Diagnosis and Treatment of Scarlet Fever, with Special Reference to the Use of Sulfanilamide, Scarlet Fever Antitoxin and Convalescent Serum" and on "The Portal of Entry of Poliomyelitis." Dr. Edward H. Cary, Dallas, Texas, was the speaker June 6 on "Political Medicine."

PENNSYLVANIA

Society News.—Dr. Andrew B. Fuller, Pittsburgh, addressed the McKeesport Academy of Medicine, April 28, on "Hypertension and Coronary Diseases."—Dr. Gilson C. Engel, Philadelphia, addressed the Lebanon County Medical Society, Lebanon, May 13, on "Diseases of the Thyroid Gland."—Dr. Francis F. Borzell, Philadelphia, addressed the Northampton County Medical Society, May 16, at the Northampton Country Club near Easton on "What Medical Defense Means to the County Societies."

Philadelphia

Special Meeting on Nutrition.—The committee on nutrition and deficiency diseases of the Philadelphia County Medical Society and the Philadelphia Child Health Society sponsored a special meeting on nutrition May 9, with the following speakers: Drs. Rufus S. Reeves on "Nutrition—The Cornerstone of National Defense"; Herbert T. Kelly, "Medical Aspects of Nutrition"; Ralph M. Tyson, "Effect of Nutrition of the Mother on the Health of the Baby," and Pauline Beery Mack, Ph.D., State College, "Mass Studies in Human Nutrition."

Doctors' and Nurses' Night.—The Philadelphia County Medical Society devoted its meeting May 14 to "Doctors' and Nurses' Night." Nursing facilities available to physicians and patients in Philadelphia County were explained by representatives of official groups of nurses and the following addresses were given: Drs. Edgar van Nuys Allen, Rochester, Minn., on "The Blood Pressure Problem"; Francis F. Borzell, "The Handmaiden of Modern Medicine"; Miss Katharine Tucker, director of nursing education, University of Pennsylvania, "Nursing and National Defense," and Mrs. Katharine Miller, general secretary, Pennsylvania State Nurses' Association, "Pennsylvania and the Nursing Inventory."

Pittsburgh

Medical Research at Mellon Institute.—The annual report for the thirtieth year of the Mellon Institute of Industrial Research, for the fiscal year ended March 1, states that the institute has spent \$1,258,866 in studies in pure science. There have been 187 fellows and 114 fellowship assistants working under ninety-three industrial fellowships. Chemical, bacteriologic and clinical investigations on the chemotherapy of pneumonia have continued to be important in the institute's program in cooperation with a staff of medical associates at Mercy Hospital in Pittsburgh. Other phases of chemotherapy have been under investigation at the Western Pennsylvania Hospital, notably natural resistance factors in pneumococcal infection and the common cold and in basic bacteriologic experimentation bearing on therapeutic procedure. Another project is concerned with pharmacopeial standards for surgical dressings and gut and silk sutures. During the past year the nutrition fellowship of the Buhl Foundation terminated its five year program of research on the relation of foods to dental caries. The conclusion was reached that preeruptive influences are dominant in the subsequent susceptibility of rat teeth to caries. Air Hygiene Foundation, whose headquarters are in the institute, is reported to be revising its programs of medical and engineering research to stress projects of more immediate benefit in the national emergency. More attention is to be given to chemical hygiene, a study of sick absenteeism in industry and plant surveys for member companies to combat occupational hazards incident to increased production. This foundation supports research at the Harvard School of Public Health, the Saranac Laboratory at Saranac Lake, N. Y., and the University of Pennsylvania, Philadelphia.

VIRGINIA

Regional Meetings.—At a meeting of the South Piedmont Medical Society in Danville, April 16, the speakers included Drs. Edwin C. Hamblen, Durham, N. C., on "Diagnosis and Treatment of Ovarian Failure During the Reproductive Period"; Porter P. Vinson, Richmond, "Significance of Difficulty in Swallowing"; George B. Craddock, Lynchburg, "Sulfonamide Drugs"; Isham K. Briggs, South Boston, "Treatment of Industrial Injuries," and Samuel R. Newman, Danville, "Convulsions During Anesthesia." Dr. Edwin E. Barksdale, Danville, was elected president.—A symposium on pain was presented at the spring meeting of the Southwestern Virginia Medical Society in Pulaski, April 18, by Drs. Isaac A. Bigger, William B. Porter, Robert Finley Gayle Jr., William Gayle Crutchfield and Carrington Williams, all of Richmond. In the evening Dr. Walter B. Martin, Norfolk, president of the Medical Society of Virginia, gave an address on "The Use of Sulfanilamide Drugs by the General Practitioner with Special Reference to Toxic Reactions."

WISCONSIN

George Crownhart Dies Suddenly.—Jesse George Crownhart, Madison, since 1923 executive secretary of the State Medical Society of Wisconsin, died June 5 of coronary thrombosis while attending the Annual Session of the American Medical Association in Cleveland. Mr. Crownhart was born in Superior, Oct. 8, 1896, and graduated from the University of Wisconsin in 1921. For the subsequent two years he served as legislative correspondent for the Holmes News Service. Since 1923 he has been executive secretary of the state medical society and managing editor of the *Wisconsin Medical Journal*. He was secretary of the Wisconsin Hospital Association, 1930-1937, and a member of the governor's Committee on Public Welfare, 1936-1937, and was for many years an officer in the Wisconsin National Guard. He was a member of the Wisconsin Historical Society, American Hospital Association, Wisconsin Press Association, and National Collegiate Players. He was joint author of "Who's Who at Wisconsin," 1920, and "Medical Blue Book of Wisconsin," 1928 and 1929. In 1937

the state medical society sent Mr. Crownhart abroad to study medical care operating under governmental control in various countries; his report, entitled "Sickness Insurance in Europe," was published in 1938. Mr. Crownhart was an indefatigable worker and an able administrator.

PHILIPPINE ISLANDS

Department of Health and Public Welfare.—The Philippine legislature has approved the creation of a department of health and public welfare to take the place of the former administration as a division of the department of public instruction. Dr. Jose Fabella, Manila, who has been commissioner of health and welfare under the former arrangement, has been appointed secretary of health, and Dr. Hilario Lara, Manila, is undersecretary. The *Journal of the Philippine Medical Association* notes that the association has been urging the creation of this separate department of health in its official deliberations since 1931. Previously a law authorizing such a department was passed by the legislature in 1923, but it was vetoed by Governor General Leonard Wood, who nevertheless expressed his favorable opinion of it in principle, the *Journal* said.

GENERAL

League of Nations Narcotic Office Moved to Washington.—According to the Washington (D. C.) *Times-Herald*, April 12, the narcotics division of the League of Nations has been moved to Washington from Geneva, Switzerland. It was said that powers involved in the European war are still contributing to the cooperative effort to regulate the flow of narcotics among the sixty-seven nations participating in the international narcotics agreements.

Association for Study of Neoplastic Diseases.—The summer meeting of the American Association for the Study of Neoplastic Diseases will be held at Johns Hopkins Hospital, Baltimore, June 26-28, under the presidency of Dr. Roscoe W. Teahan, Philadelphia. The meeting has been planned partly as a demonstration of gross and microscopic pathology and partly a demonstration of x-ray films and lantern slides. Every member is urged to attend, bringing both microscope and material for presentation. Dr. Eugene R. Whitmore, 2139 Wyoming Avenue, N.W., Washington, D. C., is the secretary. The annual meeting of the association will be held in Washington, September 4-6.

Fellowships Awarded in Cancer Research.—The Finney-Howell Research Foundation, Inc., Baltimore, announces that the following fellowships have been awarded for research into the cause or causes and the treatment of cancer:

Dr. Glenn Horner Algire, to work at the National Cancer Institute, Bethesda, Md.
Dr. Joseph Gilbert Hamilton, to work at the Radiation Laboratory, University of California, Berkeley.
Dr. Rose I. Shukoff, to work at the Glasgow Royal Cancer Hospital, Glasgow, Scotland.

Fellowships were renewed for a year for Margaret Nast Lewis, Ph.D., Berkeley, Calif.; Bernard E. Kline, M.S., Madison, Wis.; Dr. Julius B. Charles Abels, New York; Alfred Marshak, Ph.D., Berkeley; Dr. John F. Menke, San Francisco, and Dr. Paul C. M. Zamecnik, New York. Fellowships carrying an annual stipend of \$2,000 are awarded for the period of one year, with the possibility of renewal up to three years, at the annual meeting of the board of directors, held at the end of February. Applications must be made on blanks furnished by the secretary and filed in the office of the foundation before Jan. 1, 1942.

Association on Mental Deficiency.—The sixty-fifth annual convention of the American Association on Mental Deficiency will be held in Salt Lake City, June 20-24, under the presidency of Meta L. Anderson, Ph.D., Newark, N. J. The speakers will include:

Dr. Gilbert J. Rich, Milwaukee, The Borderline Defective in the Community.
Dr. E. Arthur Whitney, Elwyn, Pa., The Municipal Court of Philadelphia Studies the Problem of Mental Deficiency.
Sidney L. Halperin, M.A., and Dr. George M. Curtis, Columbus, Ohio, Anhidrotic Ectodermal Dysplasia Associated with Mental Deficiency.
Dr. Emiliano O. Houde, Tacoma, Wash., Most Primary Factors Necessary to the Increasing Incidence of Cretinism.
Dr. Charles C. Hawke, Winfield, Kan., Castration versus Vasectomy in the Feebleminded as a Surgical Problem.
Dr. Louis P. Harshman, Fort Wayne, Ind., Human Sterilization Before Puberty.
Dr. James Lewald, Laurel, Md., Cortical Excision for the Allaying of Tremor.
Dr. Theodore A. Watters, New Orleans, Detecting Schizophrenic Personalities.
Dr. George A. Jervis, New York, Certain Neuropathological Studies of Mental Deficiency at Letchworth Village.

Memorial to Father of American Pharmacy.—A bronze statue of William Proctor Jr., designated the "Father of American Pharmacy," was unveiled in the foyer of the American Institute of Pharmacy, Washington, D. C., May 3, the one hundred and thirty-fourth anniversary of his birth. William Marks Simpson, Baltimore, is the sculptor of the statue. The presentation was made to the American Pharmaceutical Association. Ivor Griffith, Pharm.D., president of the Philadelphia College of Pharmacy and Science, delivered the principal address. William Proctor Jr. was born in Baltimore in 1817. In 1831 he apprenticed himself to a pharmacist in Philadelphia and graduated at the Philadelphia College of Pharmacy and Science in 1837. He conducted his own pharmacy from 1844 in Philadelphia until his death in 1874. In 1840 he became a member of the Philadelphia College of Pharmacy, in 1841 he was elected to its board of trustees, in 1855 he was made corresponding secretary, in 1867 he became vice president and in 1872 he accepted the chair of pharmacy on the death of Prof. Edward Parrish. He was one of the founders of the American Pharmaceutical Association, serving as president in 1862.

Surgery Board Acts to Certify Proctologists.—At the annual meeting of the American Board of Surgery May 1 a plan of examination to certify proctologists was adopted by members of the board of surgery and representatives of the proctologists. This plan requires that every candidate wishing to be qualified in the field of proctology by examination shall meet all the requirements exacted by the American Board of Surgery as to training and pass its examinations. If the candidate passes the prescribed examinations and becomes eligible for certification by the board of surgery he shall then take an additional examination to be given by an examining committee appointed by the proctologic group in that special field. On the passing of this additional examination, which may follow immediately on the final one given by the American Board of Surgery, he may then be certified by the American Board of Surgery as having been qualified in general surgery with special reference to the field of proctology. At the recent meeting the American Board of Surgery elected the following officers, among others: Drs. Allen O. Whipple, New York, chairman; Fred W. Rankin, Lexington, Ky., vice chairman, and John Stewart Rodman, Philadelphia, secretary-treasurer.

Northwest Medical Association.—The eighteenth annual meeting of the Pacific Northwest Medical Association will be held at the Davenport Hotel, Spokane, Wash., June 25-28. The ten speakers on the program will each present three papers:

- Dr. Russell L. Cecil, New York, Diagnosis and Treatment of Infectious Arthritis, of Osteoarthritis and of Gouty Arthritis.
- Dr. Louis H. Clerf, Philadelphia, Clinical Significance of Hoarseness and Its Importance in Cancer of the Larynx; Bronchoscopy in Non-tuberculous Pulmonary Disease; The Esophagus and Its Diseases.
- Dr. Louis J. Karnosh, Cleveland, Neuritis and Avitaminosis; Mental Disorders Associated with Bodily Disease; Traumatic Neuroses and Psychoses.
- Dr. William J. Kerr, San Francisco, Clinical Use of the Symballophone; Pathologic and Physiologic Factors in Coronary Occlusion; Treatment of Angina Pectoris.
- Dr. Perrin H. Long, Baltimore, Experimental, Biological and Pharmacologic Background of Bacterial Chemotherapy; Clinical Use of Sulfanilamide, Sulfapyridine, Sulfathiazole; Recognition and Importance of the Toxic Manifestations of Sulfanilamide and Its Derivatives.
- Dr. Carleton Mathewson Jr., San Francisco, The Ambulatory Treatment of Certain Fractures of the Lower Extremities; The Management of Extensive Burns; The Treatment of Compound Fractures.
- Dr. John deJ. Pemberton, Rochester, Minn., Surgery of the Thyroid Gland; Lesions of the Colon and Rectum; Present Status of Surgery of the Spleen.
- Dr. Samuel Soskin, Chicago, The Fundamentals of the Physiology of Diabetes; Carbohydrate Utilization and Carbohydrate Tolerance; The Endocrine Balance in Carbohydrate Metabolism.
- Dr. William Dock, San Francisco, The Nature and Effects of Arterial Hypertension; Albuminuria and Nephrosis; Cirrhosis of the Liver.
- Dr. Leighton C. Conn, Edmonton, Alta., Amnesia and Analgesia During Labor; Hemorrhage During Labor; Vaginal Discharges and Their Treatment.

Special Society Elections.—New officers of the Association of American Physicians chosen at its annual meeting in Atlantic City, N. J., recently include Drs. James Howard Means, Boston, president; George Blumer, New Haven, Conn., vice president, and Hugh J. Morgan, Nashville, Tenn., secretary.—Dr. Arthur H. Ruggles, Providence, R. I., was named president-elect of the American Psychiatric Association at its annual meeting in Richmond, Va., in May and Dr. James K. Hall, Richmond, was installed as president. Dr. Winfred Overholser, Washington, D. C., is secretary-treasurer.—Dr. John J. Wittmer, New York, was chosen president-elect of the American Association of Industrial Physicians and Surgeons at its annual meeting in Pittsburgh May 9 and Dr. Theodore Lyle Hazlett, Pittsburgh, was inducted into the

presidency. Dr. Edward C. Holmblad, Chicago, was named to the newly created position of managing director. Cincinnati was selected as the place for the 1942 meeting.—Philip Drinker, S.D., Boston, was chosen president-elect of the American Industrial Hygiene Association at its meeting in Pittsburgh in May and Donald E. Cummings, B.S., associate professor of medicine and director of the division of industrial hygiene of the University of Colorado School of Medicine, Denver, was installed as president. Gordon C. Harrold, Ph.D., of the Chrysler Corporation, Detroit, was reelected secretary and Theodore Hatch, Philadelphia, was reelected treasurer.—Officers of the American Society for Pharmacology and Experimental Therapeutics chosen at its meeting in April include Drs. Eugene M. K. Geiling, Chicago, president (reelected); Carl F. Schmidt, Philadelphia, vice president; Raymond N. Bieter, Minneapolis, secretary; Erwin E. Nelson, New Orleans, treasurer.

CORRECTION

Dr. Brücke Did Not Go to East Indies.—An item in the Student Section, May 31, stated that Dr. Ernst Th. von Brücke of the physiology department of Harvard Medical School, Boston, was en route to the Dutch East Indies to work with the Dutch army. This was erroneous. It was Dr. A. Colaco Belmonte, formerly of Amsterdam, who was en route to the Dutch East Indies and who a few years ago served with a Red Cross unit sent by the Netherlands to Ethiopia and more recently to Finland.

Government Services

Changes in Public Health Service

A list of official orders from the U. S. Public Health Service announces the following changes:

Sr. Surg. Herbert A. Spencer, relieved at Berlin, Germany, and ordered to proceed to U. S. Immigration Station, Ellis Island, for duty.

Acting Asst. Surg. Jeremiah J. Donovan, relieved at Toronto, Canada, and ordered to Havana, Cuba, to report to American Consulate General for duty.

Asst. Surg. Ralph B. Dawson, relieved at Ellis Island, N. Y., and ordered to London, England, for duty.

Passed Asst. Surg. Erwin W. Blatter, relieved at London and ordered to U. S. Quarantine Station, Baltimore.

Asst. Surg. Wixom S. Sibley, relieved at Terminal Island, Calif., and ordered to U. S. Quarantine Station, Honolulu, T. H., for duty.

The following have recently been promoted to the titles indicated: Drs. Roscoe R. Spencer, Sanders L. Christian, Royd R. Sayers, Paul M. Stewart and Walter C. Teufel, all medical directors; Carl V. Morrison, Charles G. Spicknall, Vernam T. Davis and Harold T. Castberg, all passed assistant surgeons.

Navy Medical Center at Bethesda

The first unit of the U. S. Naval Medical Center under construction at Bethesda, Md., is nearing completion, newspapers reported April 20. The entire project, when finished, will cost \$4,850,000. With a normal capacity of six hundred and fifty beds, it is so arranged that by additional construction in a time of national emergency accommodations will be available for eighteen hundred beds. The unit now nearing completion forms the central tower of the main building and consists of sixteen stories, to house the administrative section, the surgical section including the operating rooms, the x-ray rooms and physical therapy equipment including an orthopedic pool to be used in cases of bone injuries to reduce time of hospitalization. In addition, board rooms and sick officers' quarters will be in the tower, together with the medical library of 22,000 volumes. In the front wings of the central building, three stories in height, will be the medical and dental schools, while the rear wings, also three stories high, will contain thirty-bed wards with room enough for about 100 patients to a wing. In addition to the main building, there will be erected quarters for some of the thirty-five medical officers and six dental officers on the institution's staff, a building for fifty nurses, and barracks for the two hundred and fifty navy hospital corpsmen. The entire plant will occupy more than 200 acres and replace existing facilities in Washington which are now considered inadequate.

April 12, 1941.

Pulmonary Tuberculosis in the Navy

At the Section of Epidemiology and State Medicine of the Royal Society of Medicine, Surgeon Rear Admiral Dudley, F.R.S., opened a discussion on pulmonary tuberculosis in the royal navy. He said that since the beginning of the century the invaliding rate for the disease had remained at about 2 per thousand, although the greatest efforts had been made to improve the environment by better ventilation, dust extraction and better diet, and to improve diagnosis by periodic overhauls of the men. Yet during this period the mortality in the country from tuberculosis had been nearly halved. The prevalence of tuberculosis in the navy was due to the factor of population density, which could not be eliminated or even reduced. The purpose for which a warship was designed prohibited any increase of deck space per man, and more and more men were required to work the complicated machinery. The yearly incidence of 2 per thousand seemed to be irreducible and was double the figure for the army and the air force, although the navy had a large proportion of boys and men at those younger and older ages which in civil life showed the lowest incidence of tuberculosis. The closeness of community life on the quarter deck was the determining cause of tuberculosis in the naval ratings. Among the naval officers the yearly incidence was less than 1 per thousand. They nearly always slept in separate cabins and their living accommodation was more spacious.

All men in the navy suspected of having pulmonary tuberculosis were at once examined with the roentgen rays. Little effect on the incidence could be expected from this examination of recruits or of limited numbers of contacts, and periodic roentgen ray examination of the total force by the usual method was impracticable. Therefore mass examination by miniature photoradiography was introduced as less cumbersome and less expensive. No man would be labeled tuberculous on the evidence of a miniature film until a full size film had been taken.

Social Work in Air Raid Shelters

In an address to the Royal Society of Arts on "The Modern Troglodyte," Lord Horder, who was appointed by the government to inspect and report on air raid shelters, said that we heard a lot about foreigners crowding into the shelters, but these folk were under British protection and we must give them security and care for them. That was where we differed from the Nazis. This great and cataclysmal upheaval had brought into the shelters for inspection the slum conditions of which we said we were ashamed. For many of these citizens what the authorities had now been able to establish represented better and happier conditions than they had before night bombing began. This was an indictment of what had been called "our social system." These folk now enjoyed a communal life, though of a rudimentary sort, which bred a spirit of good temper and dignity; it enabled them to adapt themselves to the nation's exigency and spirit. That it should have needed a war and life under ground for half of the twenty-four hours to achieve a result which was bringing joy to the hearts of social workers was a humiliating thought. To get among the ordinary folk and give them sane, simple and homely advice was the dream of doctors with any vision for one hundred years. Here was field work of the best kind in preventive medicine: to keep the fit fit and to make the near fit fit. He believed that from these severe trials would emerge a group of people better fitted to arrange the pattern of their lives in the better days that all were determined to have in the future.

The Casualties of "The Battle of Britain"

For the first time a connected account of the three months almost continuous daylight fighting against the luftwaffe, known as "the battle of Britain," August-October 1940, has been given in an official pamphlet. No fewer than 2,375 German aircraft were known to have been destroyed and many others must have been. The British losses were 375 pilots killed and 358 wounded. In daylight 1,700 persons, nearly all civilians, were killed and 3,360 seriously wounded. At night 12,581 were killed and 16,965 injured. In this greatest air battle in history the German air force was reduced from a confident machine-like organization to a shattered and disordered armada. The object was to obtain a quick decision by destroying our air power and so render invasion possible. Massed formations of bombers escorted by fighters in the initial stage made twenty-six attacks on our ports and shipping. They next attacked fighter airdromes. Attacks were then delivered against inland airdromes and aircraft factories and also against residential districts. Waves of formations of from twenty to forty bombers, protected by a greater number of fighters, were sent over at intervals of twenty minutes. This continued from September 7 to October 5 as the last desperate attempt to obtain victory. Much damage was done but at a cost the Germans could not stand. In one month they lost 883 aircraft. The British losses were less than a sixth of the German.

Preparations Against a Gas Attack

A campaign to tighten up the organization for meeting a gas attack from the air on the civilian population has begun. In the presence of the inspector general of air raid precautions, tests were made in different London districts with tear gas, which had a satisfactory effect on the inhabitants, who took care to have their respirators ready for use. One object was to ascertain how quickly gas could be detected by patrolling wardens and how wardens in neighboring areas would act. To help practical training, a convoy of casualty service vehicles was driven through the concentration of gas, together with a section of the auxiliary fire service, whose members carried out a "dry hose drill." Another concentration of gas was laid outside a large department store and adjoining streets and premises as a test for the anti-gas precautions in the district and the air raid precautions service in the store, while the effects on the customers in the store were especially noted. An important point observed was the extent to which the gas penetrated the building and the height at which it might be effective.

The public response to the appeal of the authorities for cooperation was admirable. Gas masks were put on whenever they were required, and the injunction not to take cover or attempt to get into the shelters before putting them on was strictly obeyed. Persons carrying parcels obeyed the instruction to place them on the ground where they stood and then put on the masks. It is intended to repeat these tests, which were made at the request of the government, in other parts of the country.

The danger of invasion seems to have become more remote in consequence of the Balkan war. But the government has shown by repeated warnings that it expects a gas attack on the civilian population. It has issued to householders fifteen million leaflets entitled "What to Do about Gas." They contain the following: "The danger is not serious if you do the right thing. In your gas mask you have the best possible protection against gases that affect your lungs or eyes. Carry your mask always. Buy a jar of antigas ointment. If the rattles sound, put on your mask and take cover and keep it on until you hear handbells ringing the "Gas clear." Cover your skin up outdoors—hands in pockets, collar turned up. If you have an umbrella, put it up. Never look upward—you may get a drop of liquid gas in the eye. If you breathe any gas or vapor put on your mask at once. If the irritation is serious, go to a

first aid post. If you are splashed with liquid gas from a bomb and you can see the dark splash on your skin or clothing, dab, not wipe, as much as you can of the liquid off your skin and then rub in the ointment. Your handkerchief has become dangerous—destroy it. If you have not the ointment, wash at once with soap and water. This may save you a bad burn. Take off any splashed outer garment at once, before the liquid soaks through. If you are within five minutes of any place where you can get a wash, go there and wash yourself. Before going in, take off your shoes and any clothing which you think has been splashed.

"Poison gases will not always affect exposed foods to such an extent that they become dangerous, but in any case simple precautions will protect your foods. Food in cans or airtight bottles is perfectly safe, and flour, rice, tea and butter should be kept in tins or jars with fitting lids. Refrigerators are very good protection. If there is any risk that your food or water may have been contaminated, do not attempt to deal with them yourself. Notify the police or the air raid wardens."

Physiologic Problems of Flying

In the House of Commons the air minister, Sir Archibald Sinclair, stated that in flying special attention was being paid to the problem of cold, to the supply of oxygen at high altitudes and to night vision. The development of aircraft tended toward flying at great heights, and research was continuous in search of a solution of the physiologic problems involved. The problem of cold was being tackled by the sealing up—a difficult problem in a fighting aircraft—and the heating of cabins and by the provision of equipment, boots, gloves, helmets and underclothing of special design. The psychologic care of pilots was not less important. The early detection of signs of flying strain formed an important part of the duties of medical officers of the air force. The fighting spirit of the pilots was so strong that unless they were closely watched they kept on flying long after they should have rested from operations. The medical officer's duty was to catch them in time, so that the squadron or station commander could make them rest. Good results had been achieved. The incidence of flying strain was considerably less than was expected before the war. The four orthopedic centers of the air ministry were second to none in the country today. Behind these were rehabilitation centers situated in the most healthful part of the country, at which modern methods were applied to secure recovery as quickly as possible. In addition, centers with the most modern forms of treatment for severe burns had been established.

Science and the War Effort

Replying to a question in the House of Lords, Lord Hankey, chancellor of the duchy of Lancaster, said that scientific research in our war effort had three main pillars: the Department of Scientific and Industrial Research, the Medical Research Council and the Agricultural Research Council. The Scientific Advisory Committee to the government was in close touch through the Royal Society with the great streams of scientific research and development. The sphere of the Medical Research Council extended far beyond "medical" as this term was generally understood. It was concerned with all problems that affected man's health and efficiency and therefore assisted the defense department by promoting these in the men who operated machines such as aircraft and tanks. Research activities covered the whole field of the application of science to war. Among the subjects dealt with were the innumerable problems of the submarine, the submarine mine, the bomber and the fighter, their location by day and by night, in thick weather or in clear, the means of destroying them when located, and gas warfare in all its branches. Research in every item was being pursued systematically all over the country by an army of scientists. Our scientists were at least as good as those of the enemy.

With the aid of the scientific resources of the empire, and especially of the United States, we were building a scientific equipment destined to play an ever increasing part in our war effort.

BUDAPEST

(From Our Regular Correspondent)

March 15, 1941.

The Organization of Blood Donors

The Hungarian Red Cross Society started in the spring of 1940 to recruit blood donors. About six thousand women and girls have been supplied with printed matter, to wit, journal sheets of four colors corresponding to the blood group. On these sheets the result of clinical examination, the personal data of the donor, her short history and the respective blood group are recorded. To date only 1,955 women have been subjected to the different tests and of these 1,447 were found fit. The age of the applicants varied between 15 and 60 years. The Red Cross Society stated that in case of war the number of blood donors needed will be about ten thousand. Those who donate blood for saving wounded soldiers more than once will receive bronze medals as a special distinction, and they will be exempted from a part of the compulsory labor service that will be introduced in Hungary shortly; they will also enjoy priority if applying for any public position. In case of mobilization a certain contingent of women will be called in and their blood will be stored and taken to the front by airplanes. The stored blood will be kept for four weeks, and beyond this time it will not be used for transfusion.

Prophylactic Inoculations Against Diphtheria

The ministry of internal affairs enacted the compulsory prophylactic inoculation against diphtheria of all children in their second year of life. The inoculations are made by the medical officers of health in towns and cities and by the district physicians in villages. The inoculations are made free of charge without regard to the financial position of the parents. No inoculations are made if there is medical evidence that the child has survived diphtheria or received within the last two years regular inoculation or if feverish or if suffering from an infectious disease, or if the body is much debilitated. With the same enactment the minister ordered the inoculation also of 7 year old children. These will be made in the schools by the school physicians.

The Treatment of Cerebrospinal Meningitis with Sulfanilamide Preparations

At a recent meeting of the medical society Dr. Molitor gave an account of his experience gained in connection with 75 cases of cerebrospinal meningitis. In about 85 per cent of the cases the fever abated on the second or third day of treatment and the patients were out of bed on the fifth or sixth day of treatment. If oral administration was not feasible on account of vomiting, the drug was introduced anally through a catheter pushed up to the sigmoid. Improvement and cure were striking in almost all cases.

Marriages

MONTGOMERY A. STUART, Captain, M. C., U. S. Navy, to Mrs. Charles Fague Williams at Annapolis, Md., April 26.

ROBERT A. DEMO, Rochester, N. Y., to Miss Vilma Arseneau of Campbellton, N. B., Canada, April 19.

JOHN F. KEARNS, Dutch Harbor, Alaska, to Miss Betty Merriam of Wallace, Idaho, April 14.

ROBERT PROSSER MORROW JR., New Orleans, to Miss Lelia Terry in Laurel, Miss., April 5.

CHARLES E. ERWAY, Rochester, N. Y., to Miss Edith Daugard of Syracuse, April 12.

Deaths

Albert Graeme Mitchell * Cincinnati; University of Pennsylvania School of Medicine, Philadelphia, 1910; chairman of the Section on Pediatrics of the American Medical Association, 1934-1935; instructor in pediatrics from 1919 to 1921 and associate in pediatrics from 1921 to 1924 at his alma mater; since 1924 B. K. Rachford professor of pediatrics at the University of Cincinnati College of Medicine; member of the American Pediatric Society, American Academy of Pediatrics and the Central Society for Clinical Research; past president of the Central States Pediatric Society and the Philadelphia Pediatric Society; in 1932 was elected a member of the National Board of Medical Examiners; member of the medical committee of the National Foundation for Infantile Paralysis; medical director of the Babies Milk Fund Association in Cincinnati; in 1929 member of the White House Conference on Child Health and Protection; delegate to the second International Congress of Pediatrics in Stockholm, Sweden, in 1930; in 1938 vice president of the Pan American Medical Association Section on Pediatrics 7th Cruise Congress; during the World War served as adjutant of Hospital Unit A, as superintendent and medical director of the American Hospital for Civilian Population at Neufchateau, France, with the 149th machine gun battalion of the 42d division in the San Mihiel and Argonne offensives, and with the Army of Occupation in Germany; was commissioned a major in the medical reserve corps in 1926; member of the city board of health from 1926 to 1930; director of pediatrics and contagious diseases, Cincinnati General Hospital; chief of staff and medical director of the Children's Hospital; director of the Children's Hospital Research Foundation; consulting pediatrician to the Ohio Soldiers' and Sailors' Orphan Home, Xenia; co-author with Dr. J. P. Crozer Griffith of Philadelphia of "Textbook of Diseases of Infants and Children," now known as the "Textbook of Pediatrics"; co-author of "Pediatrics and Pediatric Nursing"; a chief associate editor of "Cyclopedia of Medicine"; on the editorial board of the *American Journal of Diseases of Children*; aged 52; died, June 1.

John Rosslyn Earp, Albany, N. Y.; L.R.C.P., London, and M.R.C.S., England, 1917; was director of the health department of Antioch College, Yellow Springs, Ohio, from 1923 to 1927; lecturer at the University of Colorado, Denver, 1928-1929; director of public health of the state of New Mexico from 1931 to 1937; became associated with the New York State Department of Health in 1937, when he was appointed medical editor of the division of public health education; served with the British Red Cross, Belgium, 1914-1915 and medical officer of the French Red Cross, 1917-1918; was awarded the Mons medal and the Medaille de la Reconnaissance Française; member of the Medical Society of the State of New York; assistant editor of the *Lancet*, 1919; editor of *Tubercle*, 1919-1920; associate editor of the *International Journal of Public Health*, 1920-1922; scientific editor of *Colorado Medicine*, 1929-1930; member of the publications committee of *Public Health Nursing*; aged 49; died, May 19.

Jacob Morgan Coffin * Colonel, United States Army, retired, San Francisco; University of Pennsylvania Department of Medicine, Philadelphia, 1900; entered the army as an assistant surgeon in 1902; at one time assistant professor of military science and tactics at his alma mater; served during the World War; was promoted through the various grades to that of colonel in 1928; retired in 1934 for disability in line of duty; aged 62; died, April 16, in the Letterman General Hospital of carcinoma of the tongue.

Roderick Duncan Kennedy * Globe, Ariz.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; member of the House of Delegates of the American Medical Association, 1928-1929; past president of the Arizona State Medical Association and the Southwestern Medical and Surgical Association; fellow of the American College of Surgeons; on the staff of the Gila County Hospital; aged 62; died, March 19, in St. Joseph's Hospital, Phoenix, of coronary thrombosis.

Arthur Storer Driscoll * Staten Island, N. Y.; Fordham University School of Medicine, New York, 1911; fellow of the American College of Surgeons; past president of the Richmond County Medical Society; served during the World War; member of the official advisory health preparedness committee; on the staffs of the Staten Island Hospital and the Richmond Memorial Hospital; aged 53; died, April 27.

James Harvey Baldwin, Baltimore; University of Pennsylvania Department of Medicine, Philadelphia, 1900; member of the Medical Society of the State of Pennsylvania; fellow of the American College of Surgeons; formerly on the staff of the Methodist Episcopal Hospital, Philadelphia; served during the World War; aged 69; died, April 18, in the Veterans Administration Facility, Coatesville, of arteriosclerosis.

Patrick George McGill, Superior, Wis.; School of Medicine and Surgery, Montreal, Que., Canada, 1890; member of the State Medical Society of Wisconsin; past president of the Douglas County Medical Society; formerly city health officer; served during the World War; aged 80; formerly on the staff of St. Mary's Hospital, where he died, April 23, of bronchopneumonia.

Loring Bradford Packard, Brockton, Mass.; Harvard Medical School, Boston, 1903; member of the Massachusetts Medical Society and the New England Roentgen Ray Society; on the staff and formerly superintendent of the Brockton Hospital; aged 63; died, April 12, in the New England Baptist Hospital, Boston, of hemorrhage resulting from aneurysm of the aorta.

George Clinton Hafford * Albion, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1887; an Affiliate Fellow of the American Medical Association; fellow of the American College of Surgeons; served during the World War; formerly member of the school board; aged 78; died, April 19, in St. Petersburg, Fla., of coronary occlusion.

Eugene Stephen Knox * Green Bay, Wis.; Marquette University School of Medicine, Milwaukee, 1914; past president and secretary of the Brown-Kewaunee-Door Counties Medical Society; served during the World War; formerly president of the staff of St. Mary's Hospital; aged 54; died, April 1, of streptococcal infection following an appendectomy.

Arthur Henry Stall, Akron, Ohio; Western Reserve University Medical Department, Cleveland, 1901; member of the American College of Radiology; past president of the Summit County Medical Society; served during the World War; formerly on the staff of the Akron City Hospital; aged 64; died, April 21, of carcinoma of the rectum.

Horace Chauncey Lyman * Chicago; University of Illinois College of Medicine, Chicago, 1915; fellow of the American College of Surgeons; served during the World War; on the staffs of the Edgewater Hospital and the Alexian Brothers Hospital, Chicago, and the West Suburban Hospital, Oak Park, Ill.; aged 48; died, April 13.

Michael Earley Murray Jr., Cambridge, Mass.; Harvard Medical School, Boston, 1932; member of the Massachusetts Medical Society; physician to the hygiene department, Harvard University; assistant in medicine, Massachusetts General Hospital, Boston; aged 36; died, April 21, in the McLean Hospital, Belmont.

George William Kutscher Jr., Asheville, N. C.; University of Pittsburgh School of Medicine, 1923; member of the Medical Society of the State of North Carolina and the American Academy of Pediatrics; formerly secretary of the Buncombe County Medical Society; aged 44; died, April 15, in Philadelphia.

Charles Gipson Dewey, Boston; Dartmouth Medical School, Hanover, N. H., 1886; member of the Massachusetts Medical Society and of the American Psychiatric Association; assistant superintendent of the Boston City Hospital from 1895 to 1899; aged 80; died, April 19, of hypostatic pneumonia and myocarditis.

Charles Henry Hall, Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1902; member of the Medical Society of the State of New York; at various times on the staffs of the Coney Island, Caledonian, Victory and Bay Ridge hospitals; aged 64; died, April 21, of cerebral thrombosis.

George Johnson Tompkins, Lynchburg, Va.; Medical College of Virginia, Richmond, 1894; member of the Medical Society of Virginia; on the staffs of the Lynchburg General Hospital, Marshall Lodge Memorial Hospital and the Virginia Baptist Hospital; aged 68; died, April 2, of heart disease.

Greta Frankenberg, Kew Gardens, N. Y.; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1919; member of the Medical Society of the State of New York; on the staff of the Long Island College Hospital, Brooklyn; aged 45; died, April 25, of carcinoma.

Lawrence Tweedie Sidwell, Pomona, Calif.; University of Nebraska College of Medicine, Omaha, 1908; at one time superintendent of the Hospital for the Tuberculous, Kearney, Neb., and the Nebraska Institution for the Feebleminded, Beatrice; aged 58; died, April 11, of heart disease.

Farel Jouard ☉ New York; New York Homeopathic Medical College and Flower Hospital, New York, 1918; on the staffs of the Mount Sinai Hospital, Polyclinic Hospital and the Gouverneur Hospital; aged 57; died, April 27, at his home in New Rochelle of lymphosarcoma.

Mary H. Fletcher Perkins, Steilacoom, Wash.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1891; member of the Washington State Medical Association; formerly on the staff of the Western State Hospital; Fort Steilacoom; aged 83; died, April 7.

Ralph C. Matheny ☉ Galesburg, Ill.; Northwestern University Medical School, Chicago, 1891; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; consulting oculist, Galesburg Hospital; aged 82; died, April 18.

Rex Vale Henry, Hedrick, Iowa; John A. Creighton Medical College, Omaha, 1901; member of the Iowa State Medical Society; served during the World War; aged 66; died, April 17, in St. Joseph Hospital, Ottumwa, of retroperitoneal tumor and volvulus and peritonitis.

William Fritchey Roth, Wilkes-Barre, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1894; member of the Medical Society of the State of Pennsylvania; on the staff of the Wyoming Valley Homeopathic Hospital; aged 69; died, April 1, of cerebral hemorrhage.

Walter Branham Hendrick, Hurtsboro, Ala.; University of Louisville (Ky.) Medical Department, 1890; member of the Medical Association of the State of Alabama; aged 72; died, April 21, in the City Hospital, Columbus, Ga., of cholecystitis and coronary heart disease.

Peter Christian Heinrich Pahl, Los Angeles; Bennett College of Eclectic Medicine and Surgery, Chicago, 1893; University of Southern California College of Medicine, Los Angeles, 1901; physician in charge and owner of a hospital bearing his name; aged 71; died, April 14.

David Low, Regina, Sask., Canada; McGill University Faculty of Medicine, Montreal, Que., 1889; past president of the Saskatchewan Medical Association and the Canadian Medical Association; member of the Saskatchewan Cancer Commission; aged 72; died, March 9.

George William Overmeyer, Retsil, Wash.; Curtis Physio-Medical Institute, Marion, Ind., 1888; Chicago Physio-Medical Institute, 1893; Hospital College of Medicine, Louisville, Ky., 1896; served during the World War; aged 78; died, April 5, of cerebral hemorrhage.

A. E. McLarty, Secaucus, N. J.; Western University Faculty of Medicine, London, Ont., Canada, 1909; served during the World War; on the staff of the Hudson County Hospital; aged 52; died, April 22, in the Medical Center of Jersey City of cerebral arteriosclerosis.

William Marcus Kendall, Beverly Hills, Calif.; Pulte Medical College, Cincinnati, 1892; formerly health officer, police surgeon and member of the board of education of Venice; aged 71; died, April 6, in the Hospital of the Good Samaritan of spontaneous pneumothorax.

Griffith Moses Jones ☉ Minneapolis; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; on the staff of the Norwegian Deaconess Hospital, aged 70; died, April 16, in Petersburg, Va., of coronary occlusion.

Henry Louis Schelling, Brooklyn; University of the City of New York Medical Department, 1890; member of the Medical Society of the State of New York; served during the World War; aged 75; died, April 13, in the Brooklyn Hospital of cerebral hemorrhage.

Charles William Simpson, Dallas, Texas; University of Tennessee Medical Department, Nashville, 1889; member of the State Medical Association of Texas; formerly medical director of the American Life Re-Insurance Company; aged 75, died, April 17.

Homer Hopkinson Marks, Berlin, N. H.; Medical School of Maine, Portland, 1906; member of the New Hampshire Medical Society; aged 65; on the staff of St. Louis Hospital, where he died, April 11, of injuries received when he fell down the elevator shaft.

John Francis Hackett, Waterbury, Conn.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1906; member of the Connecticut State Medical Society; served during the World War; aged 61; died, April 6, of coronary occlusion.

Austin Rodgers Kracaw, Denver; University of Colorado School of Medicine, Denver, 1911; member of the Colorado

State Medical Society; on the staffs of St. Joseph and Presbyterian hospitals; aged 54; died, April 4, of coronary thrombosis.

William Edward Foy, Fort Pierce, Fla.; Temple University School of Medicine, Philadelphia, 1933; member of the Florida Medical Association; on the staff of the Fort Pierce Memorial Hospital; aged 33; died, April 16, of coronary occlusion.

Estie Eri Hunt, Pendleton, Ind.; Indiana University School of Medicine, Indianapolis, 1926; at one time a member of the school board of Pendleton; aged 39; died, April 7, in the Indiana State Sanatorium, Rockville, of pulmonary tuberculosis.

Farn Butt Chu ☉ New York; Yale University School of Medicine, New Haven, Conn., 1930; aged 37; on the staffs of the Morrisania Hospital, Hospital for the Ruptured and Crippled and the Lenox Hill Hospital, where he died, April 19.

Asa Kelly Shelton, Oliver Springs, Tenn.; Vanderbilt University School of Medicine, Nashville, 1881; University of Nashville Medical Department, 1882; aged 84; died, April 7, in a hospital at Knoxville of carcinoma of the prostate.

Herbert Willis, Beach Haven, N. J.; Jefferson Medical College of Philadelphia, 1904; for many years mayor of Beach Haven, and county coroner; bank president; aged 59; died, April 8, of arteriosclerosis and cerebral hemorrhage.

Oscar Elmer Hofmann, West Hazleton, Pa.; Jefferson Medical College of Philadelphia, 1891; member of the Medical Society of the State of Pennsylvania; for many years school physician; aged 71; died, April 18, of heart disease.

Arthur Burns ☉ Houston, Texas; Johns Hopkins University School of Medicine, Baltimore, 1923; served during the World War; formerly director of the division of tuberculosis, state department of health; aged 44; died, April 8.

Howard Roxboro Elliot ☉ Grimsby, Ont., Canada; University of Toronto Faculty of Medicine, 1881; L.R.C.P. and L.R.C.S., Edinburgh, Scotland, 1881; member of the Colorado State Medical Society; aged 82; died, April 1.

Libbie Seymour Cammack, Maitland, Fla.; State University of Iowa College of Medicine, Iowa City, 1904; at one time a medical missionary; aged 64; died, April 5, in the Florida Sanitarium and Hospital, Orlando.

Caroline Reed, Veedersburg, Ind.; Northwestern University Woman's Medical School, Chicago, 1899; for many years on the staff of the Iola-Monroe County Tuberculosis Sanatorium, Rochester, N. Y.; aged 74; died, April 4.

Merritt Owen Wilkins ☉ Chicago; the General Medical College, Chicago, 1924; served during the World War; on the staff of the Illinois Masonic Hospital; aged 51; died, April 6, of coronary thrombosis and hypertension.

James Franklin Hilton ☉ Washington, D. C.; Georgetown University School of Medicine, Washington, 1904; aged 62; on the staff of the Georgetown Hospital, where he died, April 18, of carcinoma of the cecum.

Warren Leroy Lindsay, Salt Lake City; Rush Medical College, Chicago, 1917; served during the World War; on the staff of the Veterans Administration Facility; aged 57; died, April 16, of chronic nephritis.

Arnold Burkelman, Los Angeles; Bellevue Hospital Medical College, New York, 1891; member of the California Medical Association and the Pacific Coast Oto-Ophthalmological Society; aged 76; died, April 23.

Samuel Wray Alexander, McKenzie, Tenn.; University of Tennessee College of Medicine, Memphis, 1933; member of the Tennessee State Medical Association; aged 36; died, April 9, of coronary thrombosis.

George Andrew Rigrish, Charleston, W. Va.; Medical College of Ohio, Cincinnati, 1896; member of the West Virginia State Medical Association; aged 69; died, April 7, in the Kanawha Valley Hospital.

David Oswald Foley ☉ Mount Jackson, Va.; University of Maryland School of Medicine, Baltimore, 1896; aged 69; died, April 24, in the Rockingham Memorial Hospital, Harrisonburg, of angina pectoris.

Curtis Lewis Hancock, Lexington, Ky.; Hospital College of Medicine, Louisville, 1904; served during the World War; on the staff of the Veterans Administration; aged 57; died, April 20, of heart disease.

Frank Herbert Low, Santa Monica, Calif.; University of Pennsylvania School of Medicine, Philadelphia, 1929; member of the Utah State Medical Association; aged 44; died, March 30, in Salt Lake City.

Annie Luverne Harris, Richmond, Maine; Vanderbilt University School of Medicine, Nashville, Tenn., 1930; member of the Maine Medical Association; aged 38; was found murdered in March.

De Forrest Elmer Tiffany, San Jose, Calif.; State University of Iowa College of Homeopathic Medicine, Iowa City, 1893; member of the California Medical Association; aged 69; died, March 31.

Edgar Bond Armstrong, New York; Columbia University College of Physicians and Surgeons, New York, 1905; member of the Medical Society of the State of New York; aged 59; died, April 20.

David De Will Moncrief, Atlanta, Ga.; Hospital Medical College, Atlanta, 1911; served during the World War; medical examiner of the Civil Aeronautics Administration; aged 64; died, April 11.

Joseph Luther Ewing, Shreveport, La.; Memphis (Tenn.) Hospital Medical College, 1911; member of the Louisiana State Medical Society; served during the World War; aged 54; died, March 28.

Frank Rudd McDonald @ Jersey City, N. J.; University of Pennsylvania School of Medicine, Philadelphia, 1917; served during the World War; aged 52; died, April 2, of coronary occlusion.

R. A. Creekmore, Calhoun City, Miss.; Louisville (Ky.) Medical College, 1894; Memphis (Tenn.) Hospital Medical College, 1895; aged 67; died, April 15, in the Baptist Hospital, Memphis.

Robert Washington King, Ackmen, Colo.; University of Colorado School of Medicine, Denver, 1912; aged 70; died, April 16, of coronary occlusion, arthritis, gangrene and acute nephritis.

J. Louis Fichman, Indianapolis; Indiana University School of Medicine, Indianapolis, 1929; member of the Indiana State Medical Association; aged 35; died, March 29, in the Methodist Hospital.

John Vassie Brown, Orillia, Ont., Canada; University of Toronto Faculty of Medicine, 1903; served during the World War; aged 64; died, April 8, in the Christie Street Hospital, Toronto.

John James Smith, Paris, Ark.; Vanderbilt University School of Medicine, Nashville, Tenn., 1879; Jefferson Medical College of Philadelphia, 1891; aged 87; died, April 4, of myocarditis.

Benjamin Damsky @ New York; Fordham University School of Medicine, New York, 1917; on the staff of the Mount Sinai Hospital; aged 48; died, April 24, of coronary occlusion.

Noah Gorsuch, Sunbury, Ohio; Columbus Medical College, 1892; member of the Ohio State Medical Association; aged 80; died, March 31, in the White Cross Hospital, Columbus.

John M. McClanahan, Guilford, Mo.; Missouri Medical College, St. Louis, 1886; aged 81; died, April 9, of valvular heart disease, diabetes mellitus and hypertrophy of the prostate.

George L. Perry, Portland, Ind.; Medical College of Indiana, Indianapolis, 1897; formerly county coroner and deputy coroner; aged 72; died, April 5, in the Jay County Hospital.

George Washington Heriot Jr., Roberta, Ga.; University of Georgia Medical Department, Augusta, 1928; aged 37; died, April 4, in Savannah of accidental morphine poisoning.

Charles Kahn @ Chicago; Northwestern University Medical School, Chicago, 1897; on the staff of the Englewood Hospital; aged 66; died, April 9, of coronary thrombosis.

William Francis Dryden, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900; aged 69; died, March 29.

Edward O. Woodward, Martinsville, Va.; Meharry Medical College, Nashville, Tenn., 1897; aged 75; died, April 5, of acute pyelitis and carcinoma of the prostate.

Thomas Leo Mahony, Poughkeepsie, N. Y.; Long Island College Hospital, Brooklyn, 1907; aged 60; died, April 15, in the St. Francis Hospital of carcinoma.

Isaac Hall Emison, Russellville, Ark.; Vanderbilt University School of Medicine, Nashville, Tenn., 1888; aged 86; died, March 29, in San Antonio, Texas.

Laura Willis Cook Hann, Washington, N. J.; Woman's Medical College of Baltimore, 1892; aged 81; died, April 13, in Trenton, of cerebral arteriosclerosis.

Edward Thomas Kennedy @ Chicago; College of Medicine and Surgery, Chicago, 1905; aged 61; died, April 11, in the Edgewater Hospital of pneumonia.

Frank Means Johnston @ Tuskegee, Ala.; University of the South Medical Department, Sewanee, Tenn., 1900; aged 63; died, April 3, of cerebral hemorrhage.

W. E. Lebo, Gratz, Pa.; Medico-Chirurgical College of Philadelphia, 1897; aged 66; died, April 14, in the Harrisburg (Pa.) Hospital of nephrosclerosis.

John Moore Taylor @ Indianapolis; Indiana University School of Medicine, Indianapolis, 1921; aged 50; died, April 12, of a self-inflicted bullet wound.

William Andrew Haggard @ Miami, Fla.; University of Alabama School of Medicine, University, 1911; aged 56; died, April 3, of coronary sclerosis.

Fred Ernest Davis, Alvordton, Ohio; Toledo Medical College, 1904; formerly mayor of Alvordton; aged 70; died, April 14, of arteriosclerosis.

Henry James Millstone, Chicago; Rush Medical College, Chicago, 1916; aged 48; died, April 17, of an overdose of a drug, self administered.

Arlander Alonzo Barge, Newnan, Ga.; Atlanta Medical College, 1891; member of the Medical Association of Georgia; aged 80; died in April.

Tip Cox, Arabi, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn., 1901; aged 61; died, April 4, of cerebral hemorrhage.

Harry Barton Hinchman @ Richmond, Va.; Medical College of Virginia, Richmond, 1916; aged 51; died, April 7, of coronary thrombosis.

William Monroe Edens, Estill Springs, Tenn.; University of Tennessee Medical Department, Nashville, 1890; aged 81; died, March 19.

Fred W. Cariker, Cushing, Texas; Tulane University of Louisiana School of Medicine, New Orleans, 1893; aged 69; died, April 16.

Samuel A. McConkey, Barboursville, W. Va.; Medical College of Virginia, Richmond, 1891; aged 76; died, April 8, of pneumonia.

Homer E. Songer, Kansas City, Mo.; Barnes Medical College, St. Louis, 1901; aged 65; died, April 1, of bronchopneumonia.

Ambert Young Easterwood, Ardmore, Okla.; University of Texas School of Medicine, Galveston, 1897; aged 69; died in March.

Percy C. Banghart, London, Ont., Canada; Western University Faculty of Medicine, London, 1905; aged 57; died, April 6.

Charles G. Holland, Greenville, Fla.; Louisville (Ky.) Medical College, 1891; aged 80; died, April 22, of diabetes mellitus.

Franklin English Michener, Tiffin, Ohio; Ohio Medical University, Columbus, 1898; aged 83; died, April 6, of angina pectoris.

George Noble Couch, Latham, Ill.; Bennett College of Eclectic Medicine and Surgery, Chicago, 1906; aged 65; died, April 7.

Robert Blake Tyler, Joplin, Mo.; Joplin College of Physicians and Surgeons, 1882; Civil War veteran; aged 87; died, April 2.

Margaret Doane Bigelow, Cincinnati; Laura Memorial Woman's Medical College, Cincinnati, 1899; aged 68; died in April.

Charles H. Beetem, Baltimore; Maryland Medical College, Baltimore, 1900; aged 71; died, April 13, of chronic nephritis.

Homer V. Hickman, Olney, Ill.; Barnes Medical College, St. Louis, 1901; aged 72; died, April 17, of bronchial asthma.

Eli Lewison, Canton, S. D.; Rush Medical College, Chicago, 1902; aged 66; died, April 6, of bronchopneumonia.

Austin R. Allen, Denver; Missouri Medical College, St. Louis, 1878; aged 84; died, April 9, of arteriosclerosis.

Henry F. Rhodes, Philadelphia, Mo.; Jefferson Medical College of Philadelphia, 1883; aged 82; died, April 5.

Harry B. Andrew @ New Salem, Ill.; Missouri Medical College, St. Louis, 1896; aged 68; died, April 5.

Julian Howard Herndon, Miles, Texas; Louisville (Ky.) Medical College, 1904; aged 63; died, April 16.

James E. Wyatt, Prairie Point, Miss.; Louisville (Ky.) Medical College, 1883; aged 85; died, March 17.

Gaetano Ronga, Chicago (licensed in Illinois in 1899); aged 66; died, April 6.

Correspondence

STRUCTURAL RELATIONSHIPS OF SULFAPYRIDINE AND SULFATHIAZOLE

To the Editor:—An explanation for the efficacy of sulfapyridine and sulfathiazole which I have not seen in print is suggested by an examination of their structural formulas:

Sulfapyridine.

Sulfathiazole.

Now, sulfapyridine differs from the parent sulfanilamide by having a pyridine nucleus attached to the amido group. This pyridine nucleus is present in the quinoline alkaloids, such as quinine, and also in the synthetic ethyl hydrocupreine hydrochloride. These are toxic to pneumococci, and the effectiveness of sulfapyridine may possibly be due in some measure to the added pyridine nucleus.

If sulfur is substituted for an ethylene linkage in a cyclic compound, the properties are not changed much. Thus, thio-

phenes have properties so close that it is very difficult to separate them. In the same fashion,

chemical and physical properties.

Thus, one would expect sulfathiazole to have about the same chemical properties, and therefore pharmacologic action, as sulfapyridine. It is known (Fränkel, Sigmund: *Arzneimittelsynthese*, ed. 5, Berlin, Julius Springer, 1921, p. 109) that the presence of cyclically bound sulfur in a compound exerts a "resorptive" effect similar to that of the iodides, and in a disease such as pneumonia, which is characterized by a strong exudative process, it may be that sulfathiazole exerts a beneficial effect by stimulating the resorption of the exudate.

This reasoning is by no means rigorous, but it does suggest lines of investigation with these new drugs.

EMANUEL M. ABRAHAMSON, M.D., Brooklyn.

MEDICAL FAMILIES

To the Editor:—I noticed in THE JOURNAL, May 3, page 2102, a short report from Dr. J. P. Sharon about a medical family that he knew, with their names and relationships. Although some of them are dentists, there are a number of M.D.'s among them. This report aroused my interest enough to enclose the bookplate that I had designed for my son's graduation in 1938 at Johns Hopkins. He is the seventh doctor in my family, all of whom have practiced in Baltimore in an unbroken line. He is the fourth Ferdinand. I have all the diplomas of my forebears, including those of my uncle S. M. C. and of my brother F. E. C. III, who did not live long enough to practice but died a month after graduation. My uncle after starting in medicine went into the priesthood and later became the Bishop of Indianapolis.

The reason I have Haiti on the bookplate is that the family was driven out at the time of the insurrection and settled in Baltimore.

J. A. CHATARD, M.D., Baltimore.

VARICELLA AND HERPES ZOSTER

To the Editor:—In the discussion of the relationship of varicella to herpes zoster, so much importance has been in the past attached to the report of Cantor (*Brit. M. J.* 2:508, 1921) on the complete absence of varicella from a small island in the Straits Settlements on which zoster not uncommonly occurred that the following letter is of scientific as well as historical interest:

Christmas Island
Straits Settlements
April 3, 1941

Dear Dr. Rosenberg:

Replying to your letter of January 20, 1941, I am afraid Christmas Island lost its only claim to distinction in 1933 when 4 people, all old residents on the island, were diagnosed as suffering from varicella. Again in 1940 there was 1 case. With regards to herpes zoster, I can only find 1 case recorded. This occurred in 1936.

Trusting this information will be satisfactory,

Yours very truly,

J. SCOTT CLARK, M.B., Ch.B.,
Medical Officer, Christmas Island
Phosphate Company, Ltd.

JACOB ROSENBERG, M.D., Brooklyn.

THIAMINE OVERDOSAGE

To the Editor:—In a communication on thiamine overdosage and toxicity in THE JOURNAL, May 3, Dr. Clarence A. Mills, professor of experimental medicine of the University of Cincinnati College of Medicine, stressed the importance of the recognition of symptoms of overdosage of thiamine and the possible danger of the addition of thiamine hydrochloride to bread and other commonly used foods without control over the intake level. He wrote: "Just why no reports of thiamine toxicity have appeared in medical literature is difficult to understand, for the vitamin has been widely used at daily intake levels of 10 to 50 mg. in treatment of deficiency states." I called attention to the untoward effects resulting from the use of continuous and large doses of thiamine as early as December 1938 in the *American Journal of Digestive Diseases*. The importance of irritation of the peripheral nerves resulting in herpetiform lesions was described.

CHARLES LEROY STEINBERG, M.D., Rochester, N. Y.

TRANSFUSION OF PLASMA

To the Editor:—Transfusion either of whole or of modified blood is a widely used and highly successful therapeutic procedure. It is therefore important that any attendant catastrophe be most carefully analyzed. For this reason I wish to call attention to some errors contained in the report "Death from Transfusion of Plasma" by Dr. Frank Mayner, Wyandotte, Mich. (THE JOURNAL, May 3, p. 1515).

The subject of this report was in my service in the Wyandotte General Hospital. I also cared for his elder brother when he was hospitalized with the same illness. Contrary to the statement in the report, the elder brother recovered and today is alive and well.

The statement that the patient had been given a transfusion of whole blood is also in error. The patient had had no transfusion before the plasma transfusion that was given immediately prior to his death. Therefore there could have been no question of an induced sensitivity because of a previous transfusion.

This case record and the section of lung kindly lent by Dr. Mayner have been reviewed by Dr. Warren B. Cooksey of Detroit with Dr. Armand Quick of Milwaukee and Dr. Max Strumia of Bryn Mawr, Pa. They reached the conclusion that the emboli of fibrin found only in the capillary system of the lungs came preformed from the donor's unfiltered plasma rather than having been formed after this plasma was introduced into the recipient's circulatory system.

It is well known that properly prepared plasma on standing may coagulate and form minute masses of fibrin which are potential emboli. It follows that all plasma before being administered intravenously should be filtered. This was not done in the case under discussion and undoubtedly accounts for the presence of fibrin plugs demonstrated only in the lesser circulation.

J. HUGH LEWIS, M.D., Wyandotte, Mich.

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, June 7, page 2618.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, June 23-25. Part III. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: *Written. Part I.* Various centers, Nov. 1. Final date for filing application is Aug. 4. Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York City.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Written.* Nov. 3. Final date for filing application is Sept. 23. *Oral.* Dec. 12-13. Final date for filing application is Nov. 8. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written.* Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: *Written. Part I. Group B.* Jan. 3. *Oral. Part II. Groups A and B.* Atlantic City, May or June. Final date for filing application is 90 days in advance of the examination. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: *Oral.* Portland, July 15; Chicago, Oct. 18. *Written.* March 7, 1942. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Washington, January. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 1640 State St., New Orleans, La.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 16-18. Final date for filing application is July 1. Sec., Dr. W. P. Wherry, 1500 Medical Arts Bldg., Omaha.

AMERICAN BOARD OF PEDIATRICS: *Oral.* Boston, Oct. 7-8, immediately following the annual meeting of the American Academy of Pediatrics. *Written.* Locally, Aug. 22. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY: *Oral.* New York, Dec. 19-20. Final date for filing application is Oct. 5. Sec., Dr. Walter Freeman, 1028 Connecticut Ave., N.W., Washington, D. C.

AMERICAN BOARD OF RADIOLOGY: *Oral. All groups.* Cincinnati, Sept. 19-21. Final date for filing application is Aug. 1. Sec., Dr. Byrl R. Kirkin, 102-110 Second Ave., S. W., Rochester, Minn.

AMERICAN BOARD OF UROLOGY: Chicago, February. Final date for filing application is three months before date of examination. Sec., Dr. Gilbert J. Thomas, 1009 Nicollet Ave., Minneapolis.

Hawaii January Report

The Board of Medical Examiners of the Territory of Hawaii reports the written examination for medical licensure held at Honolulu, Jan. 13-16, 1941. The examination covered 10 subjects and included 80 questions. An average of 75 per cent was required to pass. Six candidates were examined, 5 of whom passed and 1 failed. Two physicians were licensed to practice medicine by endorsement of credentials of the National Board of Medical Examiners. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Loyola University School of Medicine.....	(1939)	78	
University of Illinois College of Medicine.....	(1939)	91	
Tulane University of Louisiana School of Medicine...	(1939)	77.4	
Cornell University Medical College.....	(1939)	86	
University of Oregon Medical School.....	(1939)	80	

School	FAILED	Year Grad.
Creighton University School of Medicine.....	(1936)	

School	LICENSED BY ENDORSEMENT	Year Grad.
Harvard Medical School.....	(1937)	
Vanderbilt University School of Medicine.....	(1931)	

Colorado April Report

The Colorado State Board of Medical Examiners reports the written examination for medical licensure held at Denver, April 2-4, 1941. The examination covered 8 subjects and included 68 questions. An average of 75 per cent was required to pass. Five candidates were examined, all of whom passed. Two physicians were licensed to practice medicine by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Loyola University School of Medicine.....	(1941)	82	
Northwestern University Medical School.....	(1941)	87.8	
Rush Medical College	(1939)	80.5	
University of Oklahoma School of Medicine.....	(1940)	86	
University of Wisconsin Medical School.....	(1940)	89.8	

School	LICENSED BY ENDORSEMENT	Year Endorsement Grad. of
University of Kansas School of Medicine.....	(1934)	Kansas
University of Nebraska College of Medicine.....	(1934)	Nebraska

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Liability of Physician for Patient's Injury from Fall in Treatment Room.—The defendant physician treated the plaintiff in his office, the treatment consisting of the application of a phenol solution to the cervix of the uterus. On completion of the treatment he told her, according to his testimony, to remain on the treatment table until she felt all right. He then left the room. The patient apparently immediately got off the table, became nauseated, fainted and fell against a hot radiator, sustaining a burn. In a subsequent suit against the physician and the corporation that owned the building in which the physician's office was located, the patient contended that the physician was negligent in permitting her to remain unattended following the treatment, in keeping the treatment room extremely hot and in leaving the radiator unprotected. At the close of the plaintiff's evidence, the trial court dismissed the case and the plaintiff appealed to the Supreme Court of Washington.

With respect to the corporate owner of the building, the Supreme Court said that its stock was held primarily by physicians having offices in the building and that the defendant physician owned some twenty-two shares of the corporation's five hundred shares. The defendant paid rent as a tenant to the corporation but the corporation in no way shared in his earnings. Clearly, the court said, the plaintiff made no case against the corporation and the judgment of dismissal as to it was proper.

The defendant physician, called as an adverse witness by the plaintiff, testified that in most physicians' offices in the locality the radiators used to heat them were not protected by a covering and that the treatment table used at the time of the accident was of the type customarily used. He estimated that the temperature of the room at the time of the plaintiff's treatment was between 75 and 80 F., explaining that the room was customarily kept quite warm because of the fact that many of the patients remove their clothing before undergoing treatment. He further testified that the treatment room and its equipment was of the type customarily used in the average physician's office in the community and that the treatment administered to the plaintiff was quite common and that there was nothing about it that the average physician considered as likely to cause a patient to faint. He further said that ordinarily a nurse would not remain in the room after the treatment was administered.

It was the opinion of the Supreme Court that negligence cannot be predicated on the manner in which the treatment room was equipped nor on the presence of the hot radiator. The immediate cause of the accident was the fainting of the patient; the presence of the radiator was but a condition. Falling in a faint, the patient might have sustained injuries in other ways,

by striking her head on the floor or against some other object in the room. Since negligence is not to be presumed, the question resolved itself into whether the evidence produced by the plaintiff, in itself, or in the reasonable inference to be drawn from it, would warrant a finding of negligence by the jury predicated on the defendant's failure to have some one in attendance on the patient after administration of the treatment. The plaintiff in her complaint set out the standard by which the defendant's professional conduct was to be measured, namely "the usual practice in like cases in this locality and similar communities." Other than the testimony of the defendant, however, the plaintiff produced no evidence whatever as to what was the usual practice in like cases in the locality. The trial court dismissed the case on the ground that, in the absence of the testimony of qualified practitioners, the jury could only speculate as to what the defendant should have done under the circumstances. The plaintiff produced neither medical nor lay testimony on this issue and the Supreme Court felt that the trial court was justified in dismissing the case. The judgment of dismissal was therefore affirmed.—*Hoover v. Goss et al*, 97 P. (2d) 689 (Wash., 1940).

Medical Practice Acts: Constitutionality Not Affected by Exemption of Faith Healers.—Max A. Vogel, a naturopath, was convicted of violating the medical practice act of Texas and appealed to the court of criminal appeals of Texas. While he had no license to practice medicine, Vogel possessed a "certificate" issued by the Naturopathic Association of Texas, a corporation, which at one time was filed for record with the clerk of the county court of Bexar County, Texas. The registration of that certificate, however, was canceled by court order in July 1937.

During the argument to the jury in the present case the district attorney stated that the defendant should have known that he was required to have a license to practice medicine because many members of the Naturopathic Association of Texas had had their registered certificates eliminated from the records in a court action brought by the attorney general. At the time that this statement was made, the district attorney held in his hand a medical register, many sheets of which had not been offered in evidence. The defendant contended that this argument was improper because it had no support in the evidence. The record showed, however, that there had been introduced in evidence, without objection from the defendant, a petition against the district clerk of Bexar County praying that he be ordered to strike from the records of his office the naturopathic certificates. It was further shown that the prayer was granted and that the registration of defendant was among those eliminated from the medical register. In view of that evidence, the court thought that the argument of the district attorney was warranted and proper.

The court likewise overruled the defendant's contention that the medical practice act, by exempting from its terms those applying the "principles, tenets, or teachings of any church in ministering to the sick or suffering by prayer, without the use of any drug or material remedy," was discriminatory and therefore unconstitutional. The court could find no reversible error in the record and the judgment of conviction was affirmed.—*Vogel v. State*, 137 S. W. (2d) 1043 (Texas, 1940).

Advertising Baker's "Cancer Cure" by Mail Constitutes Use of Mails to Defraud.—In 1929 Norman Baker, who at that time was a grocery merchant, learned that a Dr. Ozias in Kansas City had discovered a hypodermic treatment reputed to cure patients suffering from cancer. Baker selected 5 test patients who had cancer and sent them to Dr. Ozias for treatment. After these patients had been treated by Dr. Ozias, Baker announced over a radio station which he owned and in a magazine which he published that a cure for cancer had been discovered. All the test patients subsequently died from cancer, but Baker continued to advertise, by means of radio, magazines, letters, pamphlets and the like, the false claim that he had discovered and perfected a sure cure for that

disease. "Dr. Ozias did not give Baker his formula for treatment of cancer, but two persons in his employ went to work for Baker." In the advertisements disseminated by Baker and his associates Bellows and Statler, persons suffering from cancer, including those in the last stages of the disease, were urged to visit either the Baker Hospital at Eureka Springs, Ark., or the Baker Institute at Muscatine, Iowa. They promised that the period of treatment at these institutions was short and the fee small, and if the patient was not cured on his first visit he would be given further treatments free of charge. Their propaganda also contained the statement that surgical operations, roentgen and radium treatments and all other remedies and treatments recommended by members of the American Medical Association would not and could not in any event cure cancer but that Baker had discovered and perfected "a sure cure" for the disease. They claimed that many persons who had been given up to die by members of the regular medical profession had been cured of cancer by Baker's method. Baker and his associates were subsequently indicted for violation of the United States postal laws (U. S. Criminal Code, Section 215; 18 U. S. C. A., Section 338) in that they used the United States mails in the perpetration of a scheme to defraud and to obtain money and property by means of false pretenses and representations. The defendant Baker did not testify in his own behalf. From a judgment of conviction the defendants appealed to the United States circuit court of appeals, eighth circuit.

The defendants first contended that the indictment under which they were convicted was insufficient because it failed to allege that any person induced to visit the Baker hospitals was also induced by fraud to part with some money or property of value. The circuit court of appeals held that the gist of the defendants' offense was the use of the mails to defraud and that it was quite immaterial whether the scheme was successful or unsuccessful. The defendants also contended that the letters and other material, including a package of salve, mailed by them did not carry out the fraudulent scheme. The court, however, held that these letters, which referred to the treatments performed or advised by the defendants and contained statements promoting the Baker hospitals and the Baker "cure," had such a relation to the fraudulent scheme as to aid in its execution.

The court could not agree with the defendants' contention that the trial court had erred in refusing to receive in evidence three reels of motion pictures purporting to show the treatment and progress of patients in the Baker hospitals. These pictures, said the court, were properly excluded because no proper foundation had been laid for their admission and there was nothing in them which could not have been better proved by oral testimony.

The defendants further contended that the evidence was insufficient to sustain the verdict of guilty. They admitted that they had advertised that treatment by the use of surgery, roentgen rays and radium and other methods of treatment recommended and used by members of the American Medical Association would not and could not in any event cure cancer and that Baker's method was "a sure cure" for that disease, but they insisted that such statement was at best a mere matter of opinion. There was, said the court, substantial evidence by eminent experts that the proper method of treating cancer is by the use of surgery, roentgen rays and radium. Conceding that the defendants could honestly have entertained an opinion as to the efficiency of some or all of the methods of treating cancer, the falsity of the defendants' statement appears from the use of the supposedly fair difference of opinion as a step in assuring the public that in contrast Baker had discovered and perfected "a sure cure" for cancer. While there may be an honest difference of opinion as to the value and efficacy of the use of a certain medicine or a certain curative practice, what is advanced as a difference of opinion cannot be used as a device to deceive or as a step so wanting in basis that it must be denounced as a fraudulent misrepresentation. The

court could not agree with the defendants' insistence that there was no proof that fake examinations had been made at the Baker hospitals as was charged in the indictment. According to the evidence, continued the court, many patients were admitted but many received only superficial treatment at best. An untrained or practical nurse gave treatments consisting of colonic and vaginal packs which should be given only by or under the direction of a physician. There were no microscopes in the hospitals and no pathologic examination or study was attempted. A physician who had been employed at the Baker hospital testified that there was no way of determining for certain whether or not patients had cancer. The chief of staff at the Baker Hospital, Beatty, testified that he detected cancer by "palpation, feeling of it and guessing whether the patient had it or not." One of the defendants, Statler, testified that he "judged cancer from looking at the patient." There was also evidence that the examination of patients consisted of "pinching them and looking at them." Two eclectic physicians who had been employed at one or the other of the Baker hospitals for various periods between 1937 and 1938 testified that they had given the same hypodermic injections, numbers 4 and 5, to all patients but that they did not know the composition of the solutions injected. According to the evidence, injection number 4 contained hydrochloric acid 0.18 of 1 per cent, salt 0.03 per cent, a trace of phosphate and the rest water, while injection number 5 contained glycerin 25.53 per cent, carbolic acid 28.4 per cent and the balance alcohol. Eminent experts testified that the remedies used by the defendants "would not effect a cure for cancer nor do any good to anything." The circuit court of appeals concluded, therefore, that there was abundant evidence of the defendants' lack of good faith. The court also believed that the conduct of the district attorney in making certain remarks about one of defendants' witnesses was unethical and reprehensible but not prejudicial, as the defendants contended. Accordingly, the circuit court of appeals affirmed the judgment of conviction. Defendants' petitions for a writ of certiorari and for a rehearing were denied by the United States Supreme Court.—*Baker et al. v. United States*, 115 F. (2d) 533 (1940); 61 S. Ct. 711 (1941); 61 S. Ct. 731 (1941).

Hospitals, Governmental: Right to Exclude Osteopaths.—By a special act of the Florida legislature, the city commissioners of Miami were authorized to establish and operate the Jackson Memorial Hospital and to create a board of trustees for the management of the institution. Pursuant to its power to establish by-laws, rules and regulations, the board adopted a rule providing that only legally licensed physicians who were graduates of class A medical schools, with an M.D. degree and eligible for membership in the Dade County Medical Association should be admitted to practice in the hospital. As a result of the enforcement of this rule the plaintiff, an osteopath, was denied the privilege of entering the hospital and caring for one of his patients. He thereupon petitioned the circuit court, Dade County, for an order to restrain the enforcement of the board's rule. From a judgment against him, the plaintiff appealed to the Supreme Court of Florida.

The plaintiff first contended that an osteopath has a constitutional right to practice his profession in a tax-supported institution and that the rule denying that right was therefore unconstitutional and discriminatory. The Supreme Court held that this contention had already been disposed of in two prior cases the facts of which were substantially the same as in this case. In the first of these, *Hayman v. City of Galveston*, 273 U. S. 414, 47 S. Ct. 363 (J. A. M. A. 89:234 [July 16] 1927), the Supreme Court of the United States said that some choice in methods of treatment in a hospital was inevitable and that it was neither unreasonable nor arbitrary to exclude the devotees of some of the numerous systems or methods of treatment of the sick. Furthermore, said the United States Supreme Court, no practitioner has a constitutional right to practice his profession in a publicly supported institution. A state is not

required to maintain a hospital for the private practice of medicine. In the other case, *Newton v. Board of Commissioners of Weld County*, 86 Colo. 446, 282 P. 1068 (J. A. M. A. 95:366 [Aug. 2] 1929), the Supreme Court of Colorado similarly held that "a regulation excluding from the county hospital, or the right to practice therein, the devotees of some of the numerous systems or methods of treating diseases authorized to practice the profession in Colorado is neither unreasonable nor arbitrary. Some choice of methods necessarily exists, and we cannot say that in the case at bar the county board of commissioners did not have an adequate basis for its resolution. Neither can we say that this resolution was not justified upon the ground, which abundantly appears from this record, that, if the right to practice in the county hospitals is open to all the different schools of medicine, there would be constant jealousies and dissatisfaction between the rival schools of medicine which probably might or would greatly lessen the usefulness of the public hospital. The court cannot substitute its judgment for that of the county board. . . ."

The plaintiff further contended that the Florida osteopathic practice act clearly disclosed a legislative intent that osteopaths and doctors of medicine should have equal rights and privileges so far as public institutions were concerned, referring particularly to section 13 of that act which provides that "Osteopathic Physicians and Surgeons licensed hereunder shall have the same rights as physicians and surgeons of other schools of medicine with respect to the treatment of cases or holding of offices in public institutions." In answering this contention the court said, in part:

We encounter but little, if any, difficulty in construing Chapter 12287 [the osteopathic act]. We find the intention of the Legislature free from doubt and the object to be accomplished in its enactment is free from ambiguity. The expression "treatment of cases" is an authority, right and privilege granted to osteopathic physicians and surgeons, after completing the course of study prescribed by law and successfully passing the prescribed examination, and by the Board of Osteopathic Medical Examiners granted a license to practice as set forth in Section 11 of the Act.

The expression in the Act that osteopathic physicians and surgeons licensed thereunder shall have the same rights as physicians and surgeons of other schools of medicine with respect to the treatment of cases or "holding of offices in public institutions" cannot be construed to mean that patients of osteopathic physicians can be granted the rights and facilities of municipal hospitals, but the "holding of [public] offices in public institutions" may be construed to mean that osteopathic physicians are legally eligible to hold office in public institutions when appointed or elected. An examination of the title of the Act, as well as the body, considered in its entirety, fails to show a legislative intent to authorize osteopathic physicians and surgeons to practice in or have all the rights and facilities of a municipal hospital extended as a matter of law to their patients. The Act as a whole is applicable to osteopathic medicine; it provides for a course of study and a Board whose duty it is to hold examinations and license those eligible to practice. We are unable to read into the Act the contentions here made on the part of counsel for appellant that osteopathic physicians can practice in and have the right and facilities of a municipal hospital extended to their patients.

The judgment of the trial court denying to the osteopath the relief sought was affirmed.—*Richardson v. City of Miami et al.*, 198 So. 51 (Fla. 1940).

COMING MEETINGS

- American Association on Mental Deficiency, Salt Lake City, June 20-24. Dr. E. Arthur Whitney, Washington Road, Elwyn, Pa., Secretary.
- American Laryngological, Rhinological and Otological Society, Los Angeles, June 16-18. Dr. C. Stewart Nash, 277 Alexander St., Rochester, N. Y., Secretary.
- American Physiotherapy Association, Asilomar, Calif., July 13-18. Miss Evelyn Anderson, Stanford University, Calif., Secretary.
- Idaho State Medical Association, Sun Valley, June 18-21. Dr. F. B. Jeppesen, 105 North 8th St., Boise, Secretary.
- Maine Medical Association, York Harbor, June 22-24. Dr. Frederick B. Carter, 22 Arsenal St., Portland, Secretary.
- Montana Medical Association of, Great Falls, June 24-26. Dr. Thomas F. Walker, 206 Medical Arts Bldg., Great Falls, Secretary.
- Pacific Northwest Medical Association, Spokane, Wash., June 25-28. Dr. C. W. Countryman, 407 Riverside Ave., Spokane, Wash., Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Bismuth Paste and Liquid Petrolatum for Wounds.

—Gurd and McKim point out that the bismuth iodoform petrolatum paste (bipp) method of treating wounds is again gaining importance. After twenty-three years of use they are convinced that the method may be safely and effectively used for the following types of wounds: 1. Acute traumatic lesions whether due to gunshot wounds, automobile injuries or construction accidents associated with potential infection and particularly with compound fractures. In less severe wounds a complete primary closure may be done occasionally. However, a delayed primary closure is nearly always advisable. When loss of tissue is so extensive so that delayed primary suture is impossible, or when moderate infection exists, secondary suture or various plastic procedures for filling the defects may be utilized. 2. Infected wounds which may have resulted from

untreated trauma or infection of operating wounds. The method is also efficacious as a prophylactic measure against infection of the wall of the body when certain infected cavities (abdominal, appendical or pulmonary abscesses, empyema and operations on the mastoid or other deep seated abscesses) are opened. The bismuth iodoform petrolatum paste method is similar (mechanical cleansing, application of an antiseptic and immobilization) to the Winnett-Orr method. However, it differs in that the iodine as used by Orr will be absorbed in a short time and no further supply will be available, but the use of bipp results in a continuous supply of nascent iodine to the tissues as long as the paste is present in the wound. The material inhibits bacterial growth and liberates small amounts of iodine over a long period. The paste is composed of one part of bismuth subnitrate with two parts of iodoform (powder) and sufficient liquid petrolatum to form a paste.

Single Trauma and Malignant Tumor.—Davis states that a single injury to previously healthy tissue has never been definitely proved to cause cancer, but a single trauma may reveal a malignant growth. No one has succeeded in experimentally producing malignant tumors by trauma alone. The element of chance may account for the incidence of trauma in a few cases in which cancer developed. The general impression of those who have studied large numbers of injured people (war injuries) is that there is no increase of cancer among them in comparison to those who have not sustained single injuries. In individual instances it may not be possible to disprove absolutely the etiologic relationship. To consider trauma as a cause, the following must be fulfilled: (1) the authenticity of the trauma, (2) the adequacy of the trauma, (3) the origin of the tumor at the injury, (4) the previous integrity of the injured part, (5) a reasonable time limit between the injury and the appearance of the tumor and (6) the positive diagnosis of the presence and type of the tumor.

Reinfection in Congenital Syphilis.—Hahn reviews the probable cases of reinfection in congenital syphilis reported in the literature. The review indicates that no definite clinical entity of reinfection in congenital syphilis has been established. In the earlier reports the diagnosis of congenital and acquired infections, of necessity, had to be inferred from clinical appearances alone. More recently workers have conformed to adequate criteria for demonstrating the acquired infection, but for evidence of prior congenital syphilis they contented themselves with the acceptance of more or less ill defined dystrophies or purely anamnestic data. Presumed reinfections in the presence of only more or less vague dystrophies as the sole evidence of congenital syphilis cannot be accepted. The first infection must be proved to be congenital. Second infection is rare in persons with acquired syphilis who have reached the latent stage before treatment is instituted. As the first early congenitally syphilitic persons adequately treated by modern standards are now reaching an age at which the incidence of acquired syphilis is high, search among them for reinfections may yield valuable information. In the files of the Syphilis Clinic of the Johns Hopkins Hospital there are 104 cases of probable or possible reinfection. Only 3 of these represent reinfections in possible congenitally syphilitic patients. One of these first came under observation at the age of 8 years and is not included because the syphilis

may have been acquired early in life. The other 2 cases are reported in detail. The congenital syphilis was adequately treated. They conform to rigid criteria for both the congenital and the acquired infection. There were thirteen years of clinical and serologic negativity, including a negative cerebrospinal fluid, between the first patient's congenital and acquired infection. Although the serologic test for syphilis of the second patient at no time became entirely negative, there were at least eight years of clinical negativity, including a negative cerebrospinal fluid, between the congenital and the acquired infection.

Anesthesia in Relation to Heart Disease.—Reid, in discussing the relation of anesthesia to heart disease, confines his remarks to anesthesia and the cellular respiration mechanism, the role of vitamin B, vagovagal reflexes and the climacteric. Cellular respiration is defined as those biologic processes and chemical mechanisms by which the cell converts the bound radiant energy of the sun stored in foodstuff molecules to free, utilizable, biotic energy, thereby making possible cellular activity and existence. Any cardiac lesion which involves either the vascular tree, the myocardium or the specific tissue will lead to a profound disturbance in the production of energy. In such an instance this energy production is still further interfered with by anesthetic agents which inhibit dehydrogenases. This action is probably the principal cause of the hyperglycemia which so often accompanies anesthesia. Many of the failures of carbon dioxide build-up, previously explained on the basis of deficient oxygen intake, are more readily intelligible on the basis of an inhibition of the dehydrogenases. It seems logical to the author to compensate for a decreased efficiency of the cellular oxidation-reduction systems, as a result of the action of anesthetic agents, by an increased oxygen tension through a supplemental oxygen supply. In any event, after the necessity for anesthesia has passed, the earlier the cells are returned to their optimal functional capacity the better. Vitamin B plays a singularly important role in cellular activity, and an adequate amount of this substance is necessary in the diet in heart disease, particularly if anesthesia is contemplated. The respiratory carriers coenzyme I, coenzyme II and flavoprotein are synthesized from the constituents of vitamin B₂. The active functioning part of coenzyme I and coenzyme II is nicotinic acid amide and riboflavin of flavoprotein. Vagovagal reflexes frequently disturb cardiac activity. Vagovagal reflexes might very well give rise to constriction of the coronary arteries with decreased blood supply to the myocardium. These reflexes are important at any time, but particularly so in structurally altered hearts or during light anesthesia. All hearts under anesthesia are functionally deranged; that is, a normal heart under anesthesia is as vulnerable to derangement from vagal stimulation as an organically diseased heart would be without anesthesia. The potentially injurious effects on cardiac activity of vagovagal reflexes are preventable or at least can be minimized by atropine therapy. The climacteric gives rise to innumerable complaints. Hot flushes and palpitation are almost regular occurrences. A high percentage of women have palpitation, cardiac pain and dyspnea; a triad often found in organic heart lesions. These symptoms, Scherf has shown, were reversible

with estrogen therapy. Electrocardiograms of such patients have revealed sinus tachycardias, depressions of the ST segment and flattening of the T waves, all of which disappear under estrogen therapy. Therefore all patients during the climacteric who have symptoms suggesting myocardial disease, particularly if they have fibroids and are about to be operated on, should have the benefit of estrogen therapy to exclude the possibility of a deficiency as being the etiologic factor.

Neurologic Symptoms in Cervical Arthritis.—Mettier and Capp analyzed the symptoms suggestive of cervical nerve-root origin in 30 patients presumably having osteoarthritis. Attempt was made to correlate the symptoms with the changes seen in the cervical vertebrae in roentgenograms taken in anteroposterior, lateral and oblique projections. The patients examined had symptoms characteristic of cervical radiculitis. Most of them were between 40 and 60 years of age. Only 3 were less than 40 years of age. The symptoms complained of were pain, rigidity of the neck and muscular weakness of the hand or arm. The onset of pain was usually abrupt and was localized in and about the shoulder, especially about the insertion of the deltoid muscle, or radiated down the arm into the fingers. As a rule these symptoms appeared months or even years before there were any complaints of neck discomfort. Usually the pain was unilateral. Some patients complained only of numbness and tingling in the fingers or of a drawing or dead, aching sensation in the muscles of the arms. Restriction of use of one upper extremity was a common complaint. There was no atrophy of the muscles of the hands, arms or shoulder girdle. The arm reflexes were normal. The presence or absence of arthritis in the cervical vertebrae was determined by roentgen observations. Marked hypertrophic changes were observed in 18 patients. These consisted of circumferential osteophyte formation which projected into the intervertebral canals from the superior or inferior vertebral margins, causing slight to marked narrowing of the foramina, depending on the size of the hypertrophic spurs. The osteoarthroses were more frequently on the left side. In the areas of exostoses the intervertebral disks were thinned out, causing slight narrowing to almost complete obliteration of the intervertebral spaces. The sites of predilection were between the fifth and sixth and the sixth and seventh vertebrae. The symptoms of 7 other patients were similar, but the roentgen signs of osteoarthroses were minimal in degree. There was a minimal to slight degree of osteophyte formation on the adjacent surfaces of the vertebrae, usually the fifth and sixth. This was accompanied by narrowing of the intervertebral disks in only 3 patients. In most of the patients there was some sclerosis of the articular facets. In the remaining patients there was no apparent abnormality of the articular facets, evidence of proliferative new bone formation at the vertebral margins, noticeable narrowing of the intervertebral foramina or thinning of the intervertebral disks in the roentgenograms. From the roentgen study it is evident that the combination of narrowing of the intervertebral foramina by the ingrowth of the marginal osteophytes and the decrease in the vertical diameter of the foramina, as seen in the 18 patients, may impinge on the nerve trunk as it passes through the involved foramina or may affect the sympathetic fibers con-

trolling blood flow. Why this process picks out the sensory fibers and does not also involve the motor fibers may be the fact that the motor fibers are fewer in number and comprise a bundle only one third the size of the posterior sensory fibers. Therefore actual diminution in the size of the nerve trunk may be sufficient to give rise to the radicular syndrome. It is unlikely that a similar process can adequately explain the neurologic symptoms arising in the other patients, as there was no radiopaque material in the intervertebral foramina suggesting impingement on a nerve bundle. The syndrome is of relatively frequent occurrence and, as a rule, is inadequately treated. The 30 patients were encountered in less than three months. Many had resorted to forms of treatment not regularly recognized by the medical profession. Those whose treatment was basically manipulative had definite relief. In the authors' clinic treatment consisted of heat to the neck, massage, manual traction and manipulation. Most of the patients were relieved of pain.

Liver Therapy in Subacute Cord Degeneration.—

Davison reports a postmortem study of 10 patients with pernicious anemia and neurologic signs and symptoms referable to the spinal cord. All 10 patients received liver therapy. Special study was made of the myelin sheaths, the axis cylinders and the glia. These were compared with the material studied in 1931 from untreated or inadequately treated patients. The series included 3 men and 7 women, between 35 and 76 years of age. Duration of illness varied from nine months to eight years, average four years and four months. All but 1 patient had at one time or another a blood picture typical of pernicious anemia. The 1 patient had a normal blood picture even before liver therapy was instituted. Diagnosis of pernicious anemia was made on the presence of neurologic signs referable to the posterior columns and achlorhydria. All 10 patients had achlorhydria and signs and symptoms of spinal cord involvement. The subjective neurologic symptoms improved in all but 1 patient, in whom improvement could not be evaluated because he was observed for only twenty-four hours. Objective improvement in the neurologic signs was observed in only 3 patients; in 2 the Babinski sign disappeared after liver therapy, and in 1 of these and the remaining patient the mental symptoms cleared up shortly after liver therapy was instituted. In 5 patients the histopathologic process involved the postero-

lateral columns of the cord. There was moderate gliosis in the involved pathways. The gliosis was most pronounced in the posterior columns, a condition which was best noted in the longitudinal sections. In 2 other patients the pathologic process was limited to the posterior columns and slightly to the right pyramidal tract. In the 3 remaining patients the gliosis was considerable and was present only in the posterior columns. These patients showed moderate destruction of the myelin sheaths and only slight destruction of the axis cylinders. Liver therapy was most effective in these 3 instances and led to the limitation of the process to the posterior columns, appreciable gliosis, moderate destruction of the myelin sheaths and only slight swelling of axis cylinders. In only this type of condition can improvement in the objective neurologic signs be expected. Improvement results only when there is slight destruction of the axis cylinders. Adequate liver therapy prevents further disintegration. The gliosis could not in any way restore normal function. Disease of the myelin sheaths may affect the axis cylinders and cause them to swell through irritation. Adequate liver therapy will also remove the disintegrating products and thus prevent further irritation. The sooner adequate treatment is instituted after neurologic signs and symptoms appear, the greater the chances for the signs and symptoms to disappear. Early adequate liver therapy may not only arrest or offset the progress of subacute combined degeneration of the cord but may also prevent the condition from becoming a complication of pernicious anemia, as shown by Strauss and his associates in a series of 80 cases.

Water Supply and Epidemic Poliomyelitis.—Rosenow reports the results of methods used for the isolation of pathogenic streptococci from a water supply during an epidemic of poliomyelitis in 1934 and recurring attacks of encephalomeningoradiculitis and fibromyositis in a group of patients in 1937. Streptococci were isolated more often from samples of water representing the central supply of the epidemic area than from water of control supplies, and much more often from samples obtained from the very periphery where poliomyelitis occurred and where patients who had encephalomeningoradiculitis and fibromyositis were cared for. The streptococci isolated from the water supplies resembled closely the streptococci isolated directly from patients served by the respective supplies. Each group of strains had well marked specific virulence and localizing power for animals. The serums of patients agglutinated specifically the respective strains of streptococci. The epidemic as a whole, judged by the usual epidemiologic criteria, almost certainly was not caused by contamination of the central water supply. The unprecedented high incidence of poliomyelitis among physicians and nurses attending the patients and in certain families and other groups and the high incidence of recurrent encephalomeningoradiculitis and fibromyositis during and after the epidemic would seem to incriminate the drinking water. It is considered that, in acute poliomyelitis occurring during the epidemic, the streptococcus was an integral part of the infectious process now generally attributed to virus and the cause of the unusual manifestations and that in the encephalomeningoradiculitis with fibromyositis it was the etiologic agent unassociated with the virus. The resulting diseases, however, were certainly not mainly caused by the streptococci contained in the central water supply but may have been due to peripheral "autogenous" contamination by excreta of the persons themselves. It also must be considered that the water may have been contaminated from the air. The author has isolated streptococci with specific properties from the air of rooms occupied by persons with various diseases, including poliomyelitis, and from outdoor air during epidemics.

Aluminum Phosphate for Peptic Ulcer.—Fauley and his associates present data which demonstrate that aluminum hydroxide gel interferes with phosphate absorption. They studied the effect of aluminum hydroxide gel on the excretion of phosphorus in the urine and feces of normal dogs, in 4 normal adult men receiving a "light ulcer diet," and in a child with marble bone disease on a low phosphorus diet. The results showed that aluminum hydroxide interferes with the absorption of phosphates and under certain conditions can cause a negative phosphorus balance. A phosphorus deficiency is not to be expected until the soluble aluminum salts are in excess of one

half of the total phosphorus in the diet. When this obtains in rats, chicks, guinea pigs and rabbits, the inorganic phosphorus in the blood may be reduced. Conditions predisposing to a negative phosphorus balance on aluminum hydroxide gel therapy are not likely to be present for a prolonged period in ulcer patients. The ordinary ulcer diets contain adequate phosphorus. But the possibility must be considered. Anorexia, though not pathognomonic of phosphorus deficiency, is a conspicuous symptom. Alkalis, gastric mucin, various diets and aluminum hydroxide and phosphate gel have been given Mann-Williamson dogs. The most favorable results were obtained with aluminum phosphate gel. Gastric mucin was definitely better than alkalis and aluminum hydroxide gel but was inferior to aluminum phosphate gel. The administration of large doses of mineral salts which react with the acidic or alkaline juices, whether such salts are absorbed or not, interferes with the natural mineral metabolism of the body. This disadvantage appears to be reduced by relatively inert substances, such as aluminum phosphate, which buffers acid and has a mildly astringent effect. Aluminum phosphate gel administered with a special diet prevented the development of ulcer in all but 3 of 23 Mann-Williamson dogs. After aluminum phosphate gel was discontinued and an ulcer developed, its administration caused complete healing of the ulcer in 9 of 10 dogs. These results were so favorable that aluminum phosphate gel was administered to 32 patients with duodenal and 2 with gastric ulcer to ascertain whether it might be of value. An ulcer diet was prescribed during the active stage of the ulcer combined with 15 cc., or occasionally 30 cc., of aluminum phosphate gel every two hours. Later a dose of 50 cc. with meals and at bedtime, or 30 cc. six times a day with and between meals, was prescribed. The diagnosis in all cases was supported by roentgen examinations. Seven of eight ulcer craters filled in, the exception being in 1 patient with a diagnosis of "subacute perforation" of a duodenal ulcer. This patient was not relieved by any therapy and was subjected to operation. Of 3 other failures 1 occurred in a patient with duodenal ulcer who had had many recurrences. He responded to rest, mucin and aluminum phosphate gel. Another patient with duodenal ulcer had a hemorrhage after fourteen days of treatment with aluminum phosphate and an ambulatory regimen. He responded promptly to management with rest, restricted diet, mucin and aluminum phosphate. The fourth failure was in a patient with duodenal ulcer who complained of intermittent atypical distress during several months of therapy. The same distress occurred with any type of management, and as the roentgen signs improved during management hypochondria was suspected. The response of all the other patients to the therapy was good. These results, the authors warn, should not be interpreted as indicating that aluminum phosphate therapy is superior to other therapies. The results indicate only that aluminum phosphate gel has the promise of being as effective as any other similarly acting medicament. The experimental results do not necessarily imply that aluminum phosphate gel is superior to aluminum hydroxide gel except in the presence of a relative or an absolute deficiency of pancreatic juice and bile.

*Immediate Allergic Reactions to Schick Test. J. R. Beck, Dover.—p. 26.

Immediate Allergic Reactions to Schick Test.—Beck reports three immediate allergic reactions which occurred in children who had been previously given a Schick test and who also had had alum precipitated toxoid before the first Schick test. The Schick tests which caused these reactions gave negative readings in all 3 children. It seems that hypersensitive persons may become sensitized to one of the proteins in the Schick material or in the alum toxoid, and on subsequent Schick testing an allergic reaction may occur. Its incidence is relatively infrequent, as the three reactions occurred among 15,726 Schick tests, and at least 4,000 individuals of the group had had two or more tests. Epinephrine should be on hand in the event that it might be needed, particularly when a person is being

retested or has had alum precipitated toxoid. A tourniquet tied tightly enough to prevent rapid dissemination of the injected material may be of greater importance than the injection of epinephrine hydrochloride, but this the author did not do in his 3 cases.

Patent Ductus Arteriosus and Circulation.—Eppinger and his co-workers report the results of quantitative studies of the circulation in 6 patients with patent ductus arteriosus, and in animals in which a condition similar to a patent ductus arteriosus was produced at operation. In each of the patients

patency of the ductus arteriosus was confirmed at operation. The patent ductus arteriosus was the only demonstrable anomaly. The patients were selected for operation on the basis of impressive signs or symptoms and their ducts (which measured from 7 to 9 mm. in diameter) were presumably larger than many that are recognized. When the ductus arteriosus is patent the blood flow is from the aorta to the pulmonary artery. There is no flow of blood from the pulmonary artery to the aorta. Therefore these patients do not have arterial unsaturation and are not cyanotic. The volume of blood flowing from the aorta to the pulmonary artery varied from 4 to 19 liters per minute, which is from 45 to 75 per cent of all the blood pumped into the aorta by the left ventricle. These flows occurred in patients with large ducts and under temporary conditions known to elevate cardiac output. The left ventricle expelled from two to four times the volume of blood expelled by the right ventricle. Adjustment of the circulation to the patent ductus may be made by an increase in the output of the left ventricle. If this does not compensate completely for the leak through the ductus the blood flow to the periphery may also be diminished. Comparable studies in dogs supply direct evidence of the beneficial effects of operative closure which improves the peripheral circulation and reduces the work of the heart.

Lead Encephalopathy in Children and Adults.—Akelaitis made a clinicopathologic study of lead encephalopathy in 3 children, 2 of whom died, and 2 adults, 1 of whom died. The postmortem study suggests that the structural changes in children and adults are a result of edema with exudation and hyperplastic changes in the leptomeninges and endothelial cells of the blood vessels. However, in children the process is apparently more severe and the meningeal hyperplasia may lead to hydrocephalus. The lesions may vary with the duration of the intoxication before death occurs. The clinical picture in children is analogous to that of conditions in which the intra-

cranial pressure is increased. The prognosis is grave and residuums are frequent if the child survives. The clinical picture in adults is analogous to that of any severe cerebral intoxication.

Vitamin E for Muscle Disorders of Children.—Stone treated 2 children with pseudohypertrophic muscular dystrophy and 2 with congenital myotonia with vitamin E. After from three to six months of treatment there has been a striking formation of new muscle tissue, generalized increase in strength and sense of well being. This has become apparent only since the children were placed on vitamin E. Only 1 of the patients has made a complete recovery. Through the facilities of the crippled children's and orthopedic clinics the effect of vitamin E has been observed on a large group of children between 1 and 5 years of age who came to the clinic because of poor muscular development, inability to hold up their heads until they were 2 or 3 years old, and retardation in beginning to stand or walk alone. The possibility that the muscle disturbances were caused by vitamin E deficiency in a lesser degree than present in muscular dystrophies and myotonias prompted the addition of vitamin B complex and vitamin E to these children's diets. While the vitamin B complex tended to improve their appetite or produced increase in weight, the response in muscle strength was rather slow. When vitamin E in the form of wheat germ oil was added to the vitamin B complex the increase in muscle strength was more rapid. Usually within a month the mother reported that the child was able to stand better, hold up its head, turn over without assistance and attempt walking alone. An increase in mental alertness was observed in some of the children. Children with flaccid musculature responded much better than the spastic group. The dosage in the dystrophic and myatonic group was from 2 to 4 cc. of fresh wheat germ oil given daily together with the vitamin B complex. In infants and young children with generalized muscular hypotonia the initial dose was from 8 to 12 minims (0.5 to 0.7 cc.) of wheat germ oil, preferably with vitamin B complex. Deficiency in the mother during pregnancy, or her inability to transmit vitamin E to the offspring, is possibly a factor in the development of an impaired musculature of the newborn infant. Probably certain types of muscular dystrophy, some myotonias (Oppenheim) and certain cases of poor muscular development

in the young infant are due to the same deficiency. This hypothesis is supported by the fact that vitamin E was of definite therapeutic value in such cases. As most children's diets are likely to be deficient in vitamin E, it is suggested that in certain obscure nervous and muscular disturbances of childhood vitamin E deficiency should be investigated as one of the causes.

Banana Diet for Typhoid in Children.—Schoffman observed 3 children who were fed abundant amounts of banana while ill with typhoid. Two of the patients were treated at home, and the laboratory data are not complete. All 3 patients, however, were so severely ill that their improved general state following the institution of the fruit and fruit-milk diet was not expected so soon in typhoid patients. The temperature curve decreased strikingly in from two to five days, even though the stools did not show such prompt improvement. The period of acute symptoms was shortened. The stools were negative for typhoid in from three to four weeks after onset of symptoms. The author believes that the banana and milk diet warrants further investigation.

Hereditary Hemorrhagic Telangiectasia.—During the last several years Alban encountered several members of a family exhibiting all the characteristics of hereditary hemorrhagic telangiectasia. Investigation indicates that this particular group is larger numerically than any family with this affliction heretofore reported in the American literature. At the rate that procreation is proceeding in this family, every one practicing in the Northwest will have a better than average chance of being called on for diagnosis and treatment of this disease. For that reason the author gives a general review of the established facts of the disease. In the family there have been no recorded deaths from hemorrhage, but its members say that they know it is not good for them to be operated on. The family tree chart indicates that there may be reason for this fear, as 4 members of the third generation have died post-operatively and 1 following childbirth. No explanation for these deaths has been elicited, and therefore the significance of an increased surgical hazard in this family is problematic. Investigation of six generations of this family revealed that 19 members were definitely affected and more will probably become affected as they reach the age at which telangiectasia usually develops. There is the usual preponderance of affected women and the usual transmission by either sex. Treatment consists principally of an attempt to arrest the bleeding and to maintain blood elements as close to normal levels as possible. The use of drugs and serums, long advocated, is without any rationale, since it has been definitely established that the condition is due to a hereditary maldevelopment of the vascular apparatus. When the general condition becomes poor and anemia is well defined, blood transfusion is used but is only of temporary value. Angiomas may be removed by chemical and electrical cauterization and by radium. The latter appears more promising and may prove to be the treatment of choice.

Domestic Water, Mottled Enamel and Dental Caries.

—According to Dean and his associates, epidemiologic evidence points to an inverse relationship between endemic dental fluorosis (mottled enamel) and dental caries. Many of the epidemiologic, biochemical, bacteriologic and experimental aspects of this phenomenon have been discussed, but its mechanism is not clear. Whether this inhibitory agent operates locally or systemically or involves structural or compositional factors is undetermined. For the purpose of possibly clarifying several of the undetermined questions, quantitative epidemiologic studies were made of (1) populations exposed to waters of a relatively high fluoride concentration during the period of tooth calcification followed during the post eruptive period by waters free of fluorides and (2) populations whose teeth calcified while using waters free of fluorides but followed during the post eruptive tooth period by exposure to waters whose fluoride content exceeded the minimal threshold of endemic dental fluorosis 1 part per million. The study was made at Bauxite, Ark., a community which has occupied a prominent place in the history of mottled enamel since 1928, when the source of the water was changed. Although the number of school children available for study at Bauxite was limited, it consisted of all Bauxite pupils present on the day of sampling who had developed mottled enamel while using the "old" Bauxite water supply. They were mostly pupils in the high school and the higher elementary grades and ranged from 14 to 22 years of age. This group consisted of 26 who gave a history of continuous exposure to the Bauxite common water supply and 24 who had mottled enamel while using the "old" Bauxite water but whose water histories included minor breaks in continuity of exposure. All in this group showed a relatively moderate to severe type of mottled enamel. Another group consisted of 49 children from 8 to 13 years of age with a history of continuous use of the Bauxite common water supply, including 26 children from 8 to 10 years of age born more than one and one half years after the change in the water supply and 23 children from 11 to 13 years of age born within one and one half years of the water change. A roughly comparable group in age was had in 45 Benton (Ark.) high school pupils who had never used water containing an excess of fluoride. No mottled enamel was observed in any of these pupils. The dental caries experience rate for the permanent teeth of the 50 Bauxite pupils with mottled enamel was 314 per hundred children; the 45 Benton pupils with no mottled enamel showed a rate of 675. A previous study in 1939 by Dean and his collaborators has shown that the use of a domestic water with a fluoride concentration (1.8 parts per million) not greatly in excess of the minimal threshold for endemic dental fluorosis was associated with unusually low oral lactobacillus counts. Whether the observed effects were the result of local, systemic, structural or compositional factors in the teeth is not known. The incidence of dental caries in deciduous molars does not show the cumulative increase concomitant with increasing years of exposure. It actually reverses this trend; the highest incidence is observed in the youngest age group. With approximately nine years of exposure to the risk of dental caries, only six deciduous molars were carious, or 9 per cent of the sixty-six deciduous molars present in the 17 children born prior to the change in

the water supply. In 21 children born within a year or two after the change and whose deciduous molars had approximately six and one half years of risk exposure thirty-one were carious or about 22 per cent of the one hundred and forty-one deciduous molars present. In 19 children born three and four years after the change fifty-two of these teeth showed carious involvement, or about 36 per cent of the 143 deciduous molars present.

Preoperative and Postoperative Irradiation for Mammary Cancer.—As therapy depends on the stage in which the disease is first seen, Schenck considers the clinical types or "stages" of breast cancer. In stage 1 the tumor is usually small (less than 3 cm. in diameter), freely movable and confined strictly to the affected breast. No regional nodes are felt. In stage 2 firm nodes are palpable in the axilla, the primary tumor is usually larger than 3 cm. and partially fixed to the skin and the underlying tissues (pectoral muscle or fascia). The case belongs in stage 3 when the breast is edematous or its skin is inflamed, when the tumor is large, when it is more or less fixed to the skin and underlying structures, when adherent nodes are palpable in the axilla and in the supraclavicular fossa or when distant metastasis is present. Stage 4 is represented by recurrent cancer. When the diagnosis of breast cancer is warranted and the stage of the disease is determined, the patient should receive a thorough course of high voltage roentgen treatments. This series of treatments is all important and no compromise is tolerable. In stages 1 and 2 radical surgery is indicated from six to eight weeks after irradiation. This is to be followed from four to six weeks after operation by a second adequate course of roentgen treatments. Holfelder reports twice as many five year cures in patients receiving postoperative therapy as compared with those treated by operation alone. Roentgen sterilization of the ovaries, the author believes, tends to improve the end results and is at least advisable for all patients who are still menstruating. Patients with stage 3 cancers are mainly a roentgenologic problem. They should receive as thorough a course of roentgen treatments as their condition permits. The individual as well as the disease must be treated. This is followed by conservative surgery or radium therapy as the case indicates. Further roentgen therapy is given as it becomes necessary for relieving pain and discomfort. Recurrent cancer requires radium or roentgen therapy or both. Radiation therapy should be applied and managed only by expertly trained specialists. The entire affected breast is cross fired through two ports. The rays are directed tangentially through the anterior wall of the chest so that the underlying lung is avoided. Two hundred roentgens is given daily to each of the two ports for a total of from 2,000 to 2,600 roentgens to each area. The factors used are 200 kilovolts, 50 cm. distance and filters of 2 mm. of copper and 1 mm. of aluminum. At the completion of the treatments to the breast the axilla is cross fired through anterior and posterior ports. Two hundred roentgens is given daily to each of the two fields for a total of from 1,200 to 1,800 roentgens to each. Finally, the supraclavicular fossa is treated, through anterior and posterior ports,

each area receiving 200 roentgens daily for a total of from 1,600 to 2,000 roentgens. Little radiation sickness has followed this technic. The postoperative course of radiation therapy is similar to the preoperative treatments, except that dosage is kept within the lower limits. The anterior wall of the chest is treated by tangential, obliquely directed rays. The cutaneous reaction must be closely watched during therapy. The entire scar is included in the irradiation. If for any reason preoperative irradiation was omitted, postoperative therapy is given about two weeks after surgery or as early as is commensurate with the patient's condition. Roentgen therapy promotes rather than retards healing of the wound. The postoperative therapy is indicated to prevent local recurrence and regional metastasis. As a rule, only one postoperative course of treatments is given. Further therapy, either by the roentgen rays or by radium, is indicated only in the presence of recurrence or metastasis. Irradiation for local and regional recurrences should be cautiously and judiciously applied, bearing in mind that the skin has already been exposed to two episodes of epidermolysis. Nevertheless such treatments are not contraindicated.

Local Sulfanilamide for Diffuse Peritonitis.—Rosenberg and Wall describe the results in rats following intraperitoneal implantation of sulfanilamide powder for the treatment of diffuse peritonitis. Their clinical experience is limited to 10 cases: 7 of diffuse peritonitis secondary to perforated appendix and 3 miscellaneous cases of peritoneal contamination. Recovery occurred in all instances. In the animal experiments and clinical cases the general effectiveness of sulfanilamide was shown. However, the authors state that none of this proves anything with the exception that sulfanilamide introduced intraperitoneally is in no way locally destructive or harmful to delicate tissue such as the intestinal serosa. Intraperitoneal sulfanilamide appears to have some advantage over the parenteral method. The action is more than that of absorption and systemic action and probably is due to sulfanilamide action because of an increased focal concentration. In the human being the one instillation of intraperitoneal sulfanilamide should not be depended on. It should be immediately augmented by subcutaneous sulfanilamide. The introduction of powdered sulfanilamide into the peritoneal cavity at operation after the removal

of the offending focus is not offered as a substitute for time honored and well established methods but merely as a positive additional weapon in the constant struggle against the disease.

Implantation of Estrogen Pellets for Menopausal Symptoms.—Twombly and Millen have implanted solid pellets of estrogenic materials in the treatment of 37 patients suffering from menopausal symptoms, 4 with kraurosis and leukoplakia of the vulva, 4 with leukoplakia buccalis or chronic stomatitis and 1, hyperfunction of the adrenal cortex. In general, those suffering from menopausal symptoms have been greatly relieved for from five months to more than a year. The patients with kraurosis have been improved but not cured. No effect has been noted on leukoplakia buccalis or chronic stomatitis. The only noticeable effect on the hirsute woman was the suppression of her scanty menstrual periods for two months. Pellets of 20 mg. of estradiol have proved most efficacious for prolonged alleviation of menopausal symptoms. The effective total dose has varied from one to three pellets implanted intramuscularly at intervals of one month. Their full effect becomes apparent in about one month. The effect lasts from five months to one year, as determined by improvement of subjective symptoms and vaginal smears. Pellet implantation is contraindicated in women with intact uteri as they have caused profuse and prolonged bleeding in 9 of 12 such patients. No bleeding has occurred in patients who have received castrating doses of radium some time before estrogenic therapy. Carcinomas of the breast or cervix have not been observed. Two carcinomas of the cervix and one dysgerminoma of the ovary have shown no accelerated growth after treatment.

Prevention of Human Bite Infections.—Speirs discusses the data in 114 cases of human bite infection seen within a few hours after the trauma. The method (gentle but thorough cleansing with soap and water, débridement only of damaged tissue and the application of a dry sterile dressing without suture) of Mason and Koch was followed in 82 cases and some variation of the procedure in the remaining 32 cases. There were no infected wounds among the 82 patients, except of 2 whose wounds over the knuckle were sutured. In 7 of the 14 patients who were treated with phenol and alcohol more evidence of inflammation developed than was usual; wounds became red, swollen and indurated but did not suppurate. Two patients with knuckle injuries which were cleansed and sutured required hospitalization later. The results in the entire group of cases have been gratifying, especially in comparison to former experience with cauterization, excision or extensive cleansing with strong chemical agents. The results confirm the author's belief that cleansing of the wound with soap and water within a few hours after the injury is the method of choice for prophylaxis of human bite infections. By this means the healing time of the wound is shortened and tissue destruction is minimized. In 35 patients the average time for complete healing was seven and eight-tenths days. In 60 other patients healing had progressed sufficiently far in an average time of four and nine-tenths days to warrant discharge. It is a good rule to consider any small penetrating wound on the hand as a human bite until proved otherwise. Bites on the fingers are generally on the distal phalanx. They vary from simple abrasions to compound fractures. Injuries to the lip range from penetrating wounds to almost complete avulsion, the latter being more common. Bites of the nose are usually extensive; they go through the ala severing the cartilage, the severed portion being attached only loosely over the bridge of the nose. After careful cleansing, loose approximation is permissible.

Carcinoma Erysipelatodes.—Camiel and Bolker present 2 typical cases of carcinoma erysipelatodes which developed following mastectomy. Both were mistaken for postoperative inflammatory complications, dermatitis venenata, fungous infection and radiodermatitis. The medicolegal importance of this is significant. The appearance of any peculiar cutaneous lesion following mastectomy for cancer should be regarded with suspicion and biopsy examination made. The pathologic material from repeated biopsies studied by serial sectioning indicated that the metastatic process was one of permeation of the subepidermal lymphatics and tissue spaces, rather than venous channels.

The Soldier and His Heart.—White reviews briefly the history of soldier's heart or neurocirculatory asthenia in the army. Various sources show that the chief problems concerning the soldier's circulation in the latter half of the last century were syphilitic aortitis and valvular heart disease (organic disease) and neurocirculatory asthenia (functional disorder). By 1914 to 1918 great advance had been made in weeding out important organic lesions at the time of enlistment. However some cases escaped detection and others developed in service, but "soldier's heart" became an outstanding problem. These conditions together ranked third in the causes for discharge from the British Army and Navy up to the last day of May 1918. The author states that his experience with the American Expeditionary Force in France in 1917 and 1918 was similar except that he, in comparison, found fewer organic lesions. After the World War there were (and there still are) a moderate number of so-called cardiac cripples. Most of these had neurocirculatory asthenia, which often was erroneously labeled "myocarditis" before neurocirculatory asthenia was recognized as a just cause for disability. A tabulation of 100 ex-soldiers sent to the United States Public Health Service Hospital showed 36 with a diagnosis of valvular heart disease or myocarditis. Further investigation revealed neurocirculatory asthenia alone in 45, aortic and mitral valvular disease in 16, mitral involvement alone (chiefly stenosis) in 7, aortic regurgitation alone in 6, other heart disease (1 of congenital and 1 of coronary disease) in 4 and 22 miscellaneous conditions other than heart disease. A considerable advance has been made in the last two decades in (1) rejection of new recruits with significant cardiovascular lesions, (2) early recognition of disabling cardiac conditions in the army itself and (3) measures to protect the soldier from some of the causes of heart disease, particularly syphilis and rheumatism. The 1938 report of the Surgeon General of the United States Army gave a death rate for 1937 of 3.48 per thousand among 175,624 officers and men, and only one tenth (0.35 per thousand) of the deaths were ascribed to diseases of the circulatory system as compared to the incidence cited by Myers for the British Army seventy-five years earlier, when the total death rate was more than twice as high and deaths from disease of the circulatory system three times as numerous. Now there is less heart disease in the army than in the civilian population, whereas from seventy-five to one hundred years ago soldiers actually showed a greater incidence. Of the grand total of 14.98 men per thousand discharged for disability from the United States Army in 1937, 0.92 per thousand had circulatory disabilities. Neurocirculatory asthenia no longer appears under diseases of the circulatory system but is included under diseases of the nervous system. The classification is probably still not correct. The discharge rate for neurocirculatory asthenia in 1937 was 0.24 per thousand; this is twice as great as the rate for coronary disease and a little greater than that for arteriosclerosis in other locations. In dealing with the problems concerning the soldier and his heart physicians must first try to hold the great gains that have been made in the last generation; this is difficult

when large numbers of new recruits must be examined and enlisted. However some preparedness can be effected by careful universal periodic examination of the male population of military age in time of peace. This doubtless will some day be a routine public and private health measure. The important specific problems are: (1) to learn the range of the normal heart as to size, sounds, action, roentgen picture and electrocardiogram, (2) to decide what minor abnormalities may be safely passed for military service, (3) to detect beginning lesions of the heart and aorta, (4) to decide what newly acquired lesions or symptoms are compatible with military life and in what capacity and (5) to study coronary disease and severe neurocirculatory asthenia, in order to prevent or to minimize them or at least to recognize them early. A persistently high pulse rate is a more important indication of possible neurocirculatory asthenia of significance than an elevated blood pressure. The cardiovascular criteria for admission to the Army was revised last summer.

Dextrose-Insulin for Advanced Portal Cirrhosis.—Schindler points out that he has found dextrose-insulin treatment to "turn the trick" in cases of advanced portal cirrhosis refractory to medical measures. He states that three years ago while he was giving from 400 to 600 Gm. of carbohydrate daily to a patient with Laënnec's cirrhosis considerable amounts of dextrose were present in the urine. Thinking to obviate this gross waste of carbohydrate, he gave insulin in amounts sufficient to render the urine practically sugar free. If dextrose was given intravenously it was preceded by half an hour with an amount of insulin adequate to keep sugar from appearing in the succeeding urine. The ascites disappeared two weeks after insulin was begun and this in a patient who had twenty-eight paracenteses in thirty weeks. The patient remained otherwise on the original treatment. After two months insulin was withdrawn and in a fortnight paracentesis again became necessary. The insulin was resumed and again withdrawn on three subsequent occasions so that the relation of the insulin to the disappearance of the ascites seemed established. The same procedure was repeated in 2 additional patients with far advanced Laënnec's cirrhosis with similar results. After they had received insulin for nine, six and six months, respectively, the liver recovered sufficiently to function without the insulin. All the patients have returned to a fair degree of activity and their hepatic functions, as measured by the hippuric acid synthesis and other tests, are normal. The effect of the insulin when first used was neither foreseen nor expected. Most of available data indicate that, rather than causing a deposition of glycogen in the liver, insulin actually produces a glycogen withdrawal. However, recent work by Crandall tends to show that, when a hyperglycemia exists, insulin facilitates the deposition of glycogen in the liver; this establishes a rational basis for the use of insulin in these cases. With the disappearance of ascites, blood protein rises, and although it raises the osmotic pressure it cannot be a factor in the removal of the ascites because the increase is not appreciable until after the ascites has disappeared. This same treatment (high carbohydrate intake, yeast, thiamine hydrochloride and sufficient insulin to prevent glycosuria) has been tried in other forms of hepatic damage. It has not been successful in 2 cases of cirrhosis accompanying long standing cardiac decompensation and in 1 case of syphilitic cirrhosis. Although it appears to be strikingly successful in catarrhal jaundice, the nature of the disease renders therapeutic evaluation difficult and not trustworthy.

Bone Marrow in Infections and Effect of Sulfonamides on Marrow.—Wilson reviews the literature on the bone marrow changes following sulfonamide therapy and states that during the last four years more than 50 cases of neutropenia and agranulocytosis, 30 cases of hemolytic anemia and 1 case of leukoerythroblastic anemia have been reported. He has examined the marrow, either during treatment or immediately after death, of 20 patients treated with various amounts of sulfonamides, and in no instance was he able to find quantitative or qualitative changes in the marrow cells which were not present in the marrow of similar patients not treated with sulfonamides. In the reported cases sulfanilamide was prac-

tically the only sulfonamide associated with the development of acute hemolytic anemia, no case followed the use of sulfapyridine and in no case was its administration related to neutropenia. In the cases in which the marrow was examined it appears that associated with the neutropenia of the peripheral blood there was a partial or complete disappearance of the adult granular cells of the marrow and an increase in the more primitive granular series of cells. The author observed "toxic" granules in the cytoplasm of the neutrophil cells in the marrow smears. The degree depended on the severity of the infection. These granules were more numerous in the cells at the myelocyte stage than in the mature cells. In pernicious anemia changes were not found in the myeloblasts. Few macropolyocytes were found in the bone marrow of patients with acute infections. Although they were present in the marrow of most of these patients, they were usually not released into the peripheral blood. It is suggested that the macropolyocytes arise in infections because toxins interfere with the metabolism of the hemopoietic principle and from a direct toxic effect on the cells. There was no variation in the macropolyocytes from the marrow of patients treated with sulfonamides and that from similar patients without such treatment. Nuclear budding and partial division of the nuclei of neutrophil cells and their precursors, only when prepared from curettings emulsified in serum, were most numerous in the marrow from patients with severe infections. Polykaryocytes or large multinucleated giant cells were found in the marrow of 3 patients with severe infections. It is suggested that these cells were osteoclasts. Sulfapyridine administered to 4 patients suffering from acute leukemia did not alter the clinical condition, the blood, the bone marrow or the prognosis. The conclusion is that when sulfonamides produce little or no effect on the peripheral blood there are no changes in the marrow which can be attributed to the therapy.

*Air Embolism in Otosurgery. L. Fleischmann.—p. 295.

Air Embolism in Otosurgery.—According to Fleischmann, gaping of a vascular tear and negative pressure in the vein lead to aspiration of air. The first of these two factors exists in otosurgery, because the sinus wall is fixed to a rigid bone wall and spontaneous collapse is therefore impossible in case of tear. The jugular vein is likewise situated so that gaping of a tear is facilitated. The same is true of the subclavian artery. For this reason the cervical region is a dangerous zone as regards embolism. The sitting or half sitting posture, movements involved in swallowing and deep inspiration facilitate the entrance of air. Air embolism develops in otologic surgery generally during the change of dressings because factors favorable to entrance of air (sitting position, uneasiness of the patient and deep breathing) are more prevalent at that time than during the operation. Therefore manipulations on the sinus and change of bandage, especially after opening of the sinus, should always be carried out with the patient in the recumbent position. Since the healthy sinus wall may become diseased after the operation, and since it may tear while the bandage is being changed, the exposure of the healthy sinus is not without danger and should not be done unnecessarily. The author describes 3 cases in which air embolism developed but had a favorable outcome. Mild cases of air embolism may escape recognition. The most constant and important symptom is the sucking-gurgling noise produced by aspiration of air. It ceases if pressure is exerted on the vascular opening. Air vesicles or foamy blood may appear in the wound. The so-called mill-wheel sound is produced by the mixture of air and blood in the right side of the heart. Depending on its severity, it may be perceptible only by means of the stethoscope or at a distance of several meters. Other signs are dyspnea, cyanosis, coughing, palpitation, restlessness, a feeling of congestion, irregular pulse, and piercing pains in the chest. If air aspiration is slight, there may be almost no symptoms or the symptoms subside rapidly. Rapid aspiration of large quantities of air leads to collapse and may cause death within a few minutes or hours. After air aspiration has taken place, further intake of air should be prevented by placing the head low, applying tamponade to the sinus wound and compressing the jugular vein. The cardiac and pulmonary function must be maintained by cardiac stimulants, by artificial respiration and perhaps by intracardial injection of epinephrine.

- *Psychoses from Bromide: Cases. G. Nizzi Nuti.—p. 1451.
Granulocytopenic Acute Myelosis (Schultz's Type) with Hemorrhages: Case. S. Raffaele.—p. 1483.

Psychoses from Bromides.—According to Nizzi Nuti, psychoses from bromides are more frequent than generally believed. They show the acute phase of bromide intoxication. A neuropathic constitution, a diet poor in salt and a personal sensitivity to the drug are the most important predisposing factors. The diagnosis is made from the clinical history of the patient and the local and general clinical symptoms. The course and prognosis of the intoxication are, as a rule, benign. They depend on the acuteness of the intoxication and the functional condition of the kidney. The best and most simple treatment consists in immediate discontinuation of the drug and of any sedatives and the oral administration of 5 Gm. of sodium chloride daily for about one month. A diet rich in salt completes the treatment. During the first few days there is hyperbromidemia and aggravation of psychosis, which improves as the treatment progresses. When there is a great amount of bromides in the blood, repeated aspiration of the gastric juice with a stomach tube at frequent intervals is advisable. Sodium chloride and food are administered by the tube. Spinal fluid drainage may be resorted to in acute cases to prevent intracranial hyperpressure. The maintenance of

normal intestinal and renal functions is constantly controlled. The author reports 2 instances in neuropathic patients who had had a diet poor in salt and diminished chloridemia. The amount of bromides in the gastric juice was increased before treatment and diminished after it. The basal metabolism, which was increased before treatment, became normal after. The amount of chlorides in the blood slightly increased. Discontinuation of bromides and salt therapy resulted in rapid recovery of the patients.

- *Lipids in First Aid Treatment of Aniline Poisoning. C. Bellesini.—p. 156.

Lipids in First Aid Treatment of Aniline Poisoning.—Bellesini found that intravenous injection of lecithin or cholesterol to animals with acute aniline poisoning prevented hemolysis and the nervous symptoms of acute aniline poisoning. He reports satisfactory results with lecithin as first aid treatment in several cases of aniline industrial poisoning. The treatment consists of detersion of the skin which has been in contact with aniline, and three intravenous injections of 10 cc. each of lecithin at intervals of one hour. Detersion of the skin is done with swabs of absorbent gauze moistened in sulfuric acid; pressure is used in rubbing the skin with these swabs, which are changed frequently. In acute cases it is advisable to withdraw 250 cc. of blood immediately before injecting the lecithin, which is followed by hypodermoclysis of 250 cc. of dextrose saline solution. Both the lecithin injections and phlebotomy are repeated at intervals of one hour up to a total number of three. General warm or hot baths are harmful. Aniline is not soluble in water. The bath favors peripheral vasodilatation, by which the process of assimilation of the substance by the body is stimulated.

- *Desoxicorticosterone Acetate in Dystrophy of Infants. F. J. Menchaca and N. Albarracin.—p. 15.

Desoxicorticosterone Acetate in Dystrophy of Infants.—Menchaca and Albarracin administered desoxicorticosterone acetate in conjunction with proper hygienic and dietetic therapy in 7 cases of dystrophy in infants in the first six months of life. The drug was administered in daily injections of from 1 to 1.5 mg. until from fourteen to twenty-five injections had been given for each series. The treatment consisted of two series of injections with a fifteen day interval. Satisfactory results were obtained in all but 1 case in which dystrophy was complicated by a pulmonary infection. The drug seems to have an especially favorable effect on the appetite and general condition of the patient, causing gain in weight.

Prognosis of Sepsis. H. Schulten.—p. 1399.
*Significance of Examination of Cerebrospinal Fluid for Diagnosis of Multiple Sclerosis. W. Klimke.—p. 1402.

Diets for Gastric Ulcer.—Dittmar points out that allergy is an important etiologic factor in inflammatory diseases of the gastrointestinal tract. Allergic gastritis and enteritis and their sequels, the gastric and duodenal ulcers, are comparatively frequent. The author estimates that about 30 per cent of all ulcers are allergic. The realization that nutritive antigens are responsible for the development of an allergic gastritis or ulcer also makes possible a causal, dietetic treatment. The pathogenic antigens contained in the food must be completely eliminated. This makes rational therapy possible and signifies a decisive turning away from the empiric procedure of recent decades; that is, away from the polypragmatism of the customary gastritis therapy inclusive of the diets intended to protect the stomach but which, from the standpoint of vitamins and calories, are deficient diets. The pathogenic antigens are determined by the usual methods. Their elimination from

the diet is important in the allergic forms of gastritis and ulcer, but the problems of allergy must be kept in mind also in the nonallergic inflammations of the gastric mucosa, because the inflammation increases the permeability of the intestinal wall and thus results in an increased resorption of inadequately decomposed, macromolecular foreign proteins. This eventually leads to the development of allergy to new substances. The author cites as an example the milk allergy which frequently develops after gastric operations and warns against too one-sided protein diets. He discusses the significance of the constant milieu, the physiologic course of the secretion of the gastric juice, and emphasizes that for reasons of physiologic ferment secretion the diet of patients with gastric disturbances must be similar to a normal diet. He directs attention to hypoglycemic conditions that may develop in the course of the mainly protein milk diets and stresses the necessity of the frequent administration of carbohydrates. The following points must be considered in the dietetic therapy of the nonallergic gastroduodenitis or ulcer: 1. The gastrointestinal tract must not be flooded with chiefly protein food. 2. A too one-sided diet should be avoided. 3. The equilibrium within the reactive milieu of the chyme must be considered so that the normal acceleration and inhibition of the ferment secretion is insured and with it the normal course of the resorption of foods and vitamins. 4. Carbohydrates must be given frequently and in generous amounts. The author outlines a diet which takes these points into account.

Cerebrospinal Fluid in Multiple Sclerosis.—Klimke reports 211 cases of multiple sclerosis diagnosed in his clinic. In 42 the cerebrospinal fluid obtained from the occipital as well as from the lumbar puncture was entirely normal. The author emphasizes this because he had observed in a number of cases that the occipital fluid was still normal when the lumbar fluid had disclosed pathologic conditions. The fluid should be withdrawn as near as possible to the most massive focus; that is, lumbar puncture would be preferable in most of the early cases of multiple sclerosis. The cerebrospinal fluid showed pathologic changes in 169 (80.54 per cent) of the cases. The colloidal gold chloride test produced a left-sided curve in 137 and a right-sided curve in only 29 cases. Two other cerebrospinal fluids exhibited only a mild lymphocytosis, and one showed a slight increase in albumin. Closer analysis of the fluids showing a left-sided curve disclosed thirty-two curves without increase in protein or cells, thirty-two curves with slight increase in protein (globulins), twenty-two curves with a slightly elevated cell count and fifty-one with increase in proteins and cells. The author concludes that the colloidal gold chloride reaction, more particularly the left-sided curve, is characteristic for multiple sclerosis. More than half of the curves (59 per cent) were like those seen in dementia paralytica; that is, there was discoloration in the first two tubes from blue to white. This strong discoloration was seen in nearly all cerebrospinal fluids that also had increased protein and cell contents. However, the same deep curve was observed also in many fluids that had only an increase in the cell count or only an increased protein content and even in many fluids in which both were absent. Thus the depth of the curve cannot be dependent on an increase in protein or cells. This manifestation was designated by Thurco as cytoalbuminocolloidal dissociation. The author thinks that, in the presence of deep left-sided curves without or with only slight increase in cell count and protein, the laboratory observations suggest the existence of a multiple sclerosis, provided syphilis reactions are negative. This picture is seen in no other disorder, except that in successfully treated dementia paralytica there remains a deep left-sided curve; however, if the left-sided curve is not too pronounced and there is a slight increase in proteins and cells, tabes dorsalis must be thought of, if the syphilis reactions are negative. The essential sign of dementia paralytica, that is, intense left-sided curves with moderate or severe increase in the cell count and in protein, particularly the globulins, the author observed so rarely in multiple sclerosis that it can be disregarded. The thirty-two cerebrospinal fluids with a right-sided curve disclosed atypical pictures the form of which was approximately 00012210000, associated with slight increase in cells and albumin. In 77 cases of multiple sclerosis the author was able to repeat the fluid examination several times in the course of the treat-

ment. Six of the fluids with right-sided curves changed into typical left-sided curves and five became normal, whereas the other right-sided curves remained unchanged. The fluids with left-sided curve lost the increased cell count and protein content, but the curve remained uninfluenced. The author concludes that the change from a right-sided to a left-sided curve, the disappearance of the increase in protein and cells and the persistence of the left-sided curve indicate clearly that the left-sided curve without increase in proteins and cells, that is, the cytoalbuminocolloidal dissociation, is the characteristic picture of the cerebrospinal fluid of multiple sclerosis and that conditions resembling multiple sclerosis and presenting a right-sided fluid curve probably are not true multiple sclerosis.

- *Oral Treatment with Estrogenic Substance in Ovarian Insufficiency. H. Gysi.—p. 377.
Treatment of Sympathetic Dystonia from Neurologic Point of View. H. Köbcke.—p. 388.
Bismuth Therapy of Tonsillitis. N. Maiwald.—p. 403.

Oral Estrogens in Ovarian Insufficiency.—Gysi treated extragenital symptoms of ovarian insufficiency, those occurring during the menopause as well as those accompanying disturbances in the genital cycle in younger women, by the oral administration of an estrogenic preparation. He concludes that from the perlingually administered alcoholic estradiol solution the hormone is absorbed by the oral mucosa and thus enters the systemic circulation without undergoing inactivation in the portal and hepatic circulation. For this reason the drops of estradiol solution should be taken undiluted and without a drink being taken immediately after. The patient should not swallow the drops. The drops of estradiol solution employed by the author contained 15 mg. of estradiol in 20 cc. He used this form of medication for 60 women, 30 of whom had previously received the same substance by injection. In the course of the injection treatment he had observed that particularly in the patients who were troubled by lassitude, insomnia, headaches and attacks of dizziness these symptoms were temporarily intensified before the favorable influence of the treatment became manifest. With the drop medication this could be avoided, because it was possible to subdivide the daily dose. This was corroborated in the majority of cases. On the whole, the oral medication with drops of estradiol solution produced the same results as were obtained by injection. In 50 of the 60 cases the drops alone rapidly counteracted the symptoms of ovarian insufficiency; in the other 10 cases injections of estradiol had to be added. The average daily oral dose was three times 10 drops, in severe cases five times 10 drops. For sensitive patients it is advisable to begin with somewhat smaller doses (5 drops three times daily). Whereas with injections the preparation becomes effective in about three days, the drop medication shows results only after five to seven days. Depending on the type and severity of the disorder and on the nature of the treatment, the medication must be continued for a longer period. Even after the symptoms have been counteracted, it is advisable to continue the medication with a smaller dose (three times daily 5 drops).

Implantation of Desoxycorticosterone Acetate Tablets in Adrenalectomized Dogs.—Billmann and Grathwohl report the results of experiments on 2 bitches with subcutaneously implanted crystallized desoxycorticosterone acetate tablets, undertaken to test the results obtained by Thorn, Engel and Eisenberg. They found that the dogs could be maintained by the implanted crystals in metabolic balance and good physical con-

dition. On explantation, the first signs of adrenal insufficiency manifested themselves in increased urination and intensified excretion of sodium and chlorine, with a reduced potassium excretion. Loss of body weight was, however, not noted usually until the fifth or sixth day, or the general symptoms of adrenal impairment, loss of appetite, increasing debility and vomiting. No modifications in the mineral levels of the serum nor a residual nitrogen increase were observed until the general symptoms had become pronounced. Failure to explant the tablets completely, as was seen in section on 1 dog, delayed the appearance of adrenal insufficiency for three weeks. The reimplantation of the tablets in the second dog was accompanied with signs of a critical insufficiency which necessitated medication with the drug in an oil solution. Gain of body weight and recovery of total metabolic balance did not occur until several days later.

Question of Heredity of Duodenal and Ventricular Ulcer. M. Lindlau.—p. 1356.

Use of Mercury Solutions for Diagnostic Purposes. H. Lipp.—p. 1363.

Epidemic Meningitis.—According to von Nádósy, cerebrospinal meningitis assumed epidemic proportions in Hungary during 1939 and 1940. During the height of the epidemic, between February and June 1940, 57 female patients with epidemic cerebrospinal meningitis were treated at the author's hospital. The ages of these patients varied between 10 and 68 years. Fifty-two of the patients received chemotherapy, chiefly in the form of sulfapyridine either alone or in combination with serum. Among these 52 the death rate was 7.6 per cent, whereas the total death rate (among the 57) was 12.3 per cent. This mortality rate is favorable when it is considered that the hospitalized cases are usually the more serious and the mortality rate for all Hungary was 18.5 per cent. However, even a death rate of 18.5 per cent is comparatively low when it is considered that it used to fluctuate between 20 and 80 per cent. The author thinks that the reduction in the mortality is probably the result of the introduction of the chemotherapy. He doubts that "epidemic" meningitis is always caused by the meningococcus of Weichselbaum, because the number of cases of meningitis caused by other organisms was considerable during the year under consideration. It is possible that these organisms (pneumococci, streptococci, staphylococci, tubercle bacilli and influenza bacilli) are only secondary causal agents in addition to meningococci. On the other hand, it is possible that at times of epidemics as yet unknown factors produce a "predisposition" to meningitis. The author thinks that treatment with meningococcus serum was only a supporting measure, because he found that serum therapy alone had unfavorable results whereas exclusive chemotherapy produced favorable results. Sulfapyridine was given as a rule from three to four times daily in doses of 1 Gm. This medication was continued for four or five days, the total dose amounting to 15 Gm. Myodegeneration or valvular lesions indicate an unfavorable prognosis, because among the patients with these disorders there were the most fatalities. Three patients remained deaf, and in 1 case acute encephalitis caused sudden death. Of 5 patients with bloody spinal fluid 1 died from hemocephalus internus. Myocardial changes, generally demonstrable only in the electrocardiogram, were present in almost half of the cases, but they were mild and transitory.

*Permanent Results of Thoracoplastic Interventions in Pulmonary Tuberculosis. H. Gärber and H. Kunz.—p. 957.

Noteworthy Case of Increase in Thrombocytes. V. Lachnit.—p. 963.

Indication for Operation in Patients with Gallstones. R. Friedrich.—p. 969.

Results of Thoracoplasty.—Gärber and Kunz report the results of 450 thoracoplastic operations on 219 patients with pulmonary tuberculosis, which were performed at a Vienna hospital between 1933 and 1939. Eight of the 219 patients died immediately after the intervention; that is, the early mortality

amounted to 3.6 per cent. The authors say that thirty-two apical plastic operations were performed on 199 patients, one hundred and fourteen upper partial plastic operations, three anterior elastic plastic operations, one lower partial plastic operation and forty-nine total plastic operations. Cure (with negative sputum) was obtained in 104 patients, that is, in 52.3 per cent. Seventy-one of these 104 patients are able to work again. Thirty-three patients showed great improvement, whereas 21 patients either remained uninfluenced or became worse. Postoperative bronchogenic dissemination was the cause of two thirds of thirty-three late fatalities. Altogether, postoperative disseminations occurred in 52 patients. Apical thoracoplasty is contraindicated if active rales are demonstrable in the infraclavicular region. The authors recommend that in case of total as well as of partial thoracoplasty the first intervention should not be made on the apex but rather on the lower part, because the danger of postoperative dissemination is greater if the operation is begun from above. Total thoracoplasty should be planned in the presence of extensive processes and of large cavities.

*Virulence Studies of Avian Tubercle Bacilli. S. Asakawa.—p. 1000.

Virulence of Avian Tubercle Bacilli.—Three pathologic types of reaction, each exhibiting different degrees of virulence in rabbits, have been demonstrated in avian tubercle bacilli. These are the (1) Yersin type, which is characterized by generalized bacillemia without tubercle formation, (2) Villemin type, typified by acute miliary processes, and (3) chronic type, affecting chiefly the bones, joints and testes. Using several strains of avian tubercle bacilli, Asakawa made virulence studies in rabbits, with the following results: When virulent organisms were injected intravenously in large amounts, the animals showed the Yersin type reaction, whereas smaller doses resulted in the Villemin type reaction. In the former type of reaction the experimental animals became jaundiced in about seven days after administration and underwent sudden decrease in body weight. The greatest numbers of injected organisms were found in the liver and spleen, in which were seen globular masses of tubercle bacilli arranged in a spokelike pattern. Hyperbilirubinemia, which may be regarded as fairly specific to the effect of avian tubercle bacilli, followed the intravenous administration of organisms. Intraperitoneal injection resulted in an indefinite pathologic picture, and jaundice occurred but irregularly. After subcutaneous injection the only noticeable changes were those of local necrosis at the site of administration, no systemic manifestations being encountered. Intracutaneous injection of the suspension resulted in localized erythema and ulceration, followed by complete healing of the scar in from one to two months. The avian tuberculin test was strongly positive in animals infected with the organism. The author concludes that the type of reaction following injection of avian tubercle bacilli depends on the route and dose employed, and the Yersin type reaction is primarily a condition due to tubercle bacillemia.

*Pathologic Rupture of Urinary Bladder. K. Funakoshi.—p. 1057.

Pathologic Rupture of Urinary Bladder.—Funakoshi reports two cases of spontaneous or pathologic rupture of the urinary bladder, a condition which is regarded as extremely rare. The first patient, a man aged 62, gave a history of urethral stricture which had been surgically treated three years previously. The difficulty in urination, with passage of occasional blood clots in the urine and pain over the suprapubic area, continued for three years, when sudden stoppage of the urinary flow caused the patient to exert intra-abdominal pressure, which resulted in the rupture of the bladder followed by the appearance of a few drops of fresh blood from the urethral orifice. This accident was associated with abdominal pain and nausea. With the diagnosis of intra-abdominal rupture of the urinary bladder an exploratory operation was performed and the rupture verified. The sections made from a small block of tissue removed from the bladder revealed metastatic carcinoma

infiltrating the walls of the organ. The second patient, a man aged 24, gave a history of colon bacillus cystitis which occurred at the age of 12 years. Two days previous to admission he had a sudden pain in the lower part of the abdomen, which failed to improve with application of an ice bag and rest in bed. At operation a considerable amount of turbid yellowish fluid was found in the abdominal cavity; a complicating generalized peritonitis was apparent. The postoperative course was unsatisfactory, death ensuing on the thirty-fourth day. At necropsy the rupture of the urinary bladder was clearly found to be due to the effect of typical tuberculosis of the bladder. The author emphasizes the fact that in both cases the fluid found in the abdominal cavity possessed no odor characteristic of normal urine but that, when it was heated, a strong odor of typical urine developed. Chemical analysis of the fluid found in the abdomen, particularly for urobilinogen, is also of definite diagnostic aid in cases of pathologic rupture of the bladder.

*Studies on Alimentary Hypoglycemia. N. Kuzuya.—p. 48.

*Influence of Operative Intervention on Blood Gases in Surgical Diseases. T. Morikawa.—p. 75.

Alimentary Hypoglycemia.—Kuzuya's interest in alimentary hypoglycemia was aroused by the relatively frequent occurrence of spontaneous hypoglycemia in both diabetic and nondiabetic subjects. Using 3 normal persons, 14 diabetic and 36 assorted patients, including cases of spontaneous hypoglycemia and gastroparesis, the author endeavored to study the frequency occurrence, time interval and absolute values of blood sugar in alimentary hypoglycemia and its relation to fasting hypoglycemia. The test consisted of the oral administration of 30 Gm. of dextrose to nondiabetic and 10 Gm. to diabetic patients, and the blood sugar determinations were made thereafter at thirty minute intervals for five hours. From the results obtained the author concluded that alimentary hypoglycemia occurred in practically all the subjects tested, both diabetic and nondiabetic, and the most consistent finding was a blood sugar value of 80 to 90 mg. per hundred cubic centimeters at the peak of hypoglycemia. In diabetic patients having high sugar values before administration of the test doses, the development of alimentary hypoglycemia was relatively slight. In all the subjects the difference between the average blood sugar values before and after the test doses was about 20 mg. per hundred cubic centimeters; but in the diabetic patients this value was often exceeded. There seems to be no parallel relation between the extent of alimentary hypoglycemia and the fasting blood sugar level; naturally the patients with low fasting sugar values showed a less pronounced degree of alimentary hypoglycemia than those with high fasting levels. In the nondiabetic patients alimentary hypoglycemia occurred within two to three hours after administration of the test doses, whereas in the diabetic the level began to be depressed in three to three and a half hours. In patients with gastroparesis with disturbance in carbohydrate metabolism and in subjects with spontaneous hypoglycemia the blood sugar values frequently fell below 80 mg. per hundred cubic centimeters; these patients also frequently manifested marked hyperglycemia. The most pronounced and constant alimentary hypoglycemia occurred in patients having a mild but chronic type of spontaneous hypoglycemia; in two such cases the author was able to diagnose mild diabetes.

Blood Gases in Surgical Diseases.—Morikawa studied the influence of operative intervention on blood gases, using Barcroft's technic, in 20 surgical cases. In chronic chest diseases with relatively severe limitation in respiratory surfaces no appreciable increase occurred in oxygen unsaturation of arterial blood, although occasionally oxygen unsaturation of venous blood may reach above 10 volumes per cent. In mild inflammatory conditions involving other areas of the body the arterial blood showed a slight increase in oxygen unsaturation, but the venous blood tends to decrease in oxygen capacity with a concomitant decrease in carbon dioxide content in patients with severe circulatory disturbance. In carcinoma of the stomach the oxygen combining power is decreased but the oxygen unsaturation of the venous blood is increased. The greatest decrease in oxygen

capacity was seen in pneumoplasty; in laparotomy the value increased but slightly. The oxygen unsaturation of the arterial blood tended to increase in pneumoplastic operation; that of the venous blood showed a tendency to decrease, the extent of fluctuations depending on the nature of the operative procedures. The carbon dioxide content of blood decreased temporarily after an operation but increased after two to three days and remained high. Blood transfusions caused temporary elevation of oxygen capacity but later depressed it. The oxygen capacity of the blood showed a slight increase during anesthesia with morphine and scopolamine, but no effect was seen with injection of camphor or in lumbar anesthesia. The carbon dioxide content of blood usually decreased under anesthesia.

Norsk Magasin for Lægevidenskapen

*Chylothorax. A. Høyer.—p. 40.

Chylothorax.—Høyer says that chylothorax, an accumulation of intestinal lymph in the pleural cavity, is an exceedingly rare condition which was first described by Bartolet in 1633. Up to 1938 only 84 cases had been reported in the literature, 48 of them of traumatic origin. The mortality rate is about 50 per cent. The case reported is the first of its kind to be published in Norway. A man aged 56 was run into by an automobile and hit in the right side. There were fractures of the ninth, tenth and eleventh ribs on the right side, in two places in the tenth rib, fracture of the right elbow and of the right fibula. Five days after the accident severe symptoms of shock appeared, and roentgen examination showed a total exudate in the right pleural cavity. In the course of ten days 6,600 cc. of exudate was aspirated from the cavity. The exudate at first resembled cocoa and gradually became cream colored. Chemical analysis of the exudate revealed values typical of chyle. After the last tapping the chyle effusion ceased. Forty days after the accident the patient was discharged as well.

*Enlargement of Liver in Diabetes Mellitus: Examinations by Means of Liver Biopsy. N. B. Krarup and P. Iversen.—p. 63.

*Steatosis of Liver Treated with Vitamin B₁: Examinations by Means of Liver Biopsy. P. Iversen and N. B. Krarup.—p. 66.

Histopathology of Liver in So-Called Arspenamine Jaundice, Examined by Means of Aspiration Biopsy. K. Roholm and N. B. Krarup.—p. 68.

Histologic Examinations by Means of Liver Biopsy in Intermittent Juvenile Jaundice. N. B. Krarup and K. Roholm.—p. 72.

Examinations of Liver in Diabetes.—Krarup and Iversen report that in their two cases of grave juvenile diabetes with considerable enlargement of the liver the microscopic examinations made on liver biopsy showed the enlargement to be primarily due to an edematous choking of the individual liver cells; a slight fatty degeneration was also seen. The amount of glycogen did not exceed that found in normal livers. In one case there were considerable degenerative changes in the liver in the form of glycogen in the nuclei. In both cases the hepatic enlargement completely subsided after treatment consisting exclusively of regulation of the diabetes with diet and insulin, and simultaneously the microscopic changes disappeared, except those in the nuclei, which continued during the period of examination.

Treatment of Steatosis of Liver with Vitamin B₁.—Iversen and Krarup examined 100 medical patients by liver biopsy. The 38 found to have steatosis of the liver included 27 of the 31 chronic alcoholic addicts in the entire material; the remaining 11 had various grave disorders. On the basis of their experience with liver biopsy on the whole the authors regard fatty infiltration of the liver as pathologic. They say that marked steatosis of the liver is frequent in chronic alcoholic addicts. Only a small percentage of these show simultaneous cirrhotic changes in the liver. Steatosis of the liver is not a stable condition but may disappear in the course of weeks or months. Whether its disappearance is due to the treatment with vitamin B₁ or is a result of general hospital care together with abstinence is uncertain.

Book Notices

What Price Alcohol? A Practical Discussion of the Causes and Treatment of Alcoholism. By Robert S. Carroll, M.D., Medical Director, Highland Hospital, Asheville, North Carolina. With preface by Adolf Meyer, M.D., LL.D., Sc.D., Henry Phipps Professor and Director of the Department of Psychiatry, Johns Hopkins University, Baltimore. Cloth. Price, \$3. Pp. 362. New York: Macmillan Company, 1941.

At a time when the seriousness of the problem of addiction to alcohol is beginning to be realized and approached scientifically, it is deplorable that pseudoscientific attitudes should be placed before the public. This book, although written by a physician and psychiatrist, seems to be a moralizing treatise on the evils of alcohol, smoking and overeating, with little scientific flavor. The author's thesis as to the etiology of alcoholism might be condensed into three main factors: (1) the high speed and tension of modern living, (2) inherited neuroticism or defective constitution and (3) overindulgent upbringing. There is much discussion of defective blood-brain barriers, inherited defective nervous system, hormone dysfunction and synapse dysfunction to explain the alcoholic addict's apparent sensitivity to alcohol. There is little psychological understanding. The author objects strenuously to the use of alcohol even medicinally; he also objects to any drug-containing food or beverage in the life of the right living person and inveighs repeatedly against coffee, tea, cocoa, cigars and soft drinks containing caffeine. He is convinced that chronic self intoxication and toxicity through overeating and eating too many sweets is at the bottom of much emotional maladjustment. His treatment program, as far as one can abstract it, comprises institutionalization, tapering off and then complete abstinence from alcohol and tobacco, occupational and recreational therapy, careful diet and health building, and psychotherapy. Return of the impulse to drink is countered with a dose of castor oil and a meatless meal, then perhaps a second dose if the impulse has not departed. The psychotherapy—which apparently is done by teachers or psychologists—involves much ethical discussion, reeducation and exhortation. The author refers vaguely to "analysis" but certainly does not mean psychoanalysis.

Brucellosis or Bang's Disease of Farm Animals. By C. P. Fitch and W. L. Boyd. University of Minnesota, Agricultural Experiment Station, Bulletin 348. Paper. Pp. 32, with 12 illustrations. St. Paul, 1940.

This bulletin was prepared primarily for distribution to veterinarians, dairymen and farmers, but it contains much information of interest and value to physicians. The widespread incidence of brucellosis in human beings has caused physicians to give heed to the manner in which brucellosis may be prevented and controlled in cattle. The excellent work of Dr. Fitch and his associates at the Agricultural Experiment Station of the University of Minnesota, St. Paul, in the control of brucellosis (Bang's disease) of cattle and swine is well known to students of brucellosis in human beings. It is to be deeply regretted that Dr. Fitch died in January 1940 while the manuscript of this publication was being prepared. Fitch and Boyd have found that approximately 12 per cent of the cattle tested in Minnesota are positive reactors to the agglutination test for brucellosis. They have found this test to be a safe, reliable and practical method of diagnosis of brucellosis in cattle. It has exhibited an efficiency in excess of 95 per cent. Too much reliance should not be placed on a single negative test, especially if there is evidence of active infection in the herd or if the blood sample is taken a few days before or after a calving or abortion. The federal-state plan for the elimination of brucellosis and the establishment of brucellosis free accredited herds is making good progress, and cattle owners are becoming more and more aware of the economic advantages of ridding their herds of Bang's disease. Reasonable indemnity payments are made by matched federal and state funds. Retesting of a herd should be done not more than thirty to sixty days after the first tests were made. Blood testing should be continued preferably at ninety day intervals until the herd has passed three entirely negative tests. A single negative test is not conclusive proof of the absence of brucellosis. The introduction of diseased females into healthy herds is the most common method of spreading the disease

from one herd to another. Additions made to the herd should be from herds tested and known to be free from Bang's disease. Pregnant animals should be kept in quarantine for at least ninety days after calving before being introduced into the herd and then only after the blood test is known to be negative. Vaccination of calves with a living vaccine of reduced virulence for the control of this disease in cattle is still in the experimental stage. All milk and milk products used in the feeding of negative herds should be from brucellosis free cattle or should be pasteurized. Milk from positive reactors is a dangerous source of spread of the disease, both to other cattle and to human beings. Bulls in brucellosis free herds should be used for service only on cattle that have been tested and found free from Bang's disease. Progressive breeders and milk producers are now fully aware that their herds must be free from brucellosis in order to realize the maximum financial return. The control of Bang's disease by area testing at present is the most satisfactory method for the control of this infection.

Hygiene: A Textbook for College Students on Physical and Mental Health From Personal and Public Aspects. By Florence L. Meredith, B.Sc., M.D., Professor of Hygiene, Tufts College, Boston. Foreword by Frank Howard Lahey, M.D., D.Sc., LL.D., President-Elect, American Medical Association. Third edition. Cloth. Price, \$3.50. Pp. 822, with 184 illustrations. Philadelphia: Blakiston Company, 1941.

The present edition of this well known textbook has been completely rewritten and, as with the previous editions, has been prepared especially for the college student. The theme which the author states she has tried to carry throughout the book is a discussion of the health situation which exists in the life of individuals and peoples, what health objectives arise from them and what action is scientifically appropriate on the part of the layman. This theme is introduced with an excellent general discussion of the health situation and trends in the United States, as evidenced by a study of the vital statistics of this country. About one half of the book is devoted to a consideration of the hygiene of the individual. This includes the usual discussion of circulation, digestion, respiration and reproduction. There is great detail on the anatomy and physiology of each of the systems of the body as well as the principles of hygiene relating to each system. For the college student much of this detail seems unnecessary and elementary. Because of such detail the book is more voluminous than the average college hygiene program can cover. The material on infection and resistance is well presented, and there is an excellent discussion of scientific medical practice compared to the practice of the cults. On the whole, the book is one of the most comprehensive treatments of the subject of hygiene that have been published. It would make an excellent reference book for the teacher of hygiene in the elementary and secondary school. For the use of college students it would have been more usable had there been omitted some of the detailed anatomy and physiology.

Diagnostic Procedures and Reagents: Technics for the Laboratory Diagnosis and Control of the Communicable Diseases. Cloth. Price, \$2.75. Pp. 352, with illustrations. New York: American Public Health Association, 1941.

This new book on technics for the laboratory diagnosis and control of the communicable diseases is the result of a seven year survey of the best laboratory methods now available for the recognition and control of the communicable diseases. The work was begun in 1933 by a special committee of the American Public Health Association on the preparation of reagents and the description of methods used in the public health laboratory. Those persons best qualified to describe the various procedures were selected as referees. The book marks the beginning of a development which should have an important influence on medical and administrative practice in the field of communicable disease control.

There are fifty pages by Arthur Parker Hitchens on culture mediums, stains, reagents and solutions. This chapter includes a list of sixty-six references. There are nine pages by Edmund K. Kline on the toxicity of dyes for certain bacteria. The next chapter, of twenty-four pages, on the meningococcus is written by Sara E. Branham of the National Institute of Health. There are twenty-six pages on the gonococcus by Charles M. Carpenter.

Tularemia is presented by James G. McAlpine and George D. Brigham in fourteen pages. Brucellosis, in twenty pages, is described by Arthur Parker Hitchens and Frances Sullivan. Then come chapters on *Haemophilus pertussis* by Pearl Kendrick and George McL. Lawson (eighteen pages), the pneumococcus by Elliot S. Robinson (twenty pages), hemolytic streptococci by Julia M. Coffey (fifteen pages), bacterial food poisoning by Stewart A. Koser (seventeen pages), typhus fever and other Rickettsial infections by Henry Welch (ten pages), *Eberthella typhosa* and other bacillary incitants of enteric disease by Marion B. Coleman (twenty pages), the diphtheria bacillus by Martin Frobisher (thirty pages), the tubercle bacillus by A. L. MacNabb (twelve pages), examination of specimens for *Spirochaeta pallida* by Ruth Gilbert (three pages), serodiagnosis of syphilis by Ruth Gilbert and Elizabeth Maltaner (twenty pages), examination of cerebrospinal fluid for evidence of syphilis of the central nervous system by Ruth Gilbert (three pages), rabies by T. F. Sellers (fourteen pages), and pathogenic fungi by W. D. Stovall and Lois Alman (seventeen pages). There is a sixteen page index.

This new book is the best and most authoritative publication on the laboratory diagnosis of the communicable diseases. It is safe to predict that it will soon be found in the hands of all laboratory workers interested in the diagnosis and prevention of the communicable diseases.

Progress of Scientific Research in the Field of the Exceptional Child. Proceedings of the Sixth Institute on the Exceptional Child of the Child Research Clinic of the Woods Schools, a Private School for Exceptional Children at Langhorne, Pa., Tuesday, Oct. 24, 1939. Paper. Pp. 64, with illustrations. Langhorne, [n. d.].

This pamphlet is a report of the proceedings of the Sixth Institute on the Exceptional Child, conducted by the Child Research Clinic of the Woods Schools, a private school for exceptional children at Langhorne, Pa. Although the institute was held in October 1939, the pamphlet was not received for review until Jan. 17, 1941.

The program consisted of a morning and afternoon session, during which five papers were presented with the following titles and authors:

- The Child, The Savage, and Human Experience
A. Irving Hollowell, Ph.D.
University of Pennsylvania.
- What Is An Exceptional Child?
W. E. Bhatz, Ph.D.
University of Toronto.
- The Interplay Between Intellectual and Emotional Factors in Personality Diagnosis.
Bruno Klopfer, Ph.D.
Rorschach Institute, New York.
- A Method for the Study of Personality Reactions in Preschool Age Children by Means of Analysis of Their Play.
J. Louise Despert, M.D.
Payne Whitney Psychiatric Clinic
New York Hospital, New York.
- A Special School Looks at Special Education.
Charles M. Morris, Ph.D.
Woods Schools, Langhorne, Pa.

The papers are presented apparently in full, with extensive bibliographic notations. A specimen chart of the Rorschach method, which is a projective method for the study of personality, is attached.

This publication should be useful and interesting to physicians and psychologists interested in the exceptional child.

The Comparative Physiology of Respiratory Mechanisms. By August Krogh. Publication of the William J. Cooper Foundation. Cloth. Price, \$3. Pp. 172, with 84 illustrations. Philadelphia: University of Pennsylvania Press; London: Oxford University Press, 1941.

This volume is an outgrowth of a series of lectures delivered at Swarthmore College in 1939 and represents an important contribution to the physiology of respiration. Professor Krogh has put together in his inimitably simple and interesting way a review of his own and others' work on respiratory mechanisms in numerous forms of animal life. Although the book is full of detailed information, as would be evident from the illustrations and tables, the description of how respiratory mechanisms of diverse types meet the peculiar needs of animals in various environmental situations is easy and fascinating reading. In describing respiratory mechanisms involving (1)

simple diffusion in small aquatic forms, (2) water lungs, (3) branchial water gills, (4) air breathing gills, (5) diffusion lungs and (6) ventilation lungs, the author has covered the comparative physiology of external respiration. Many ingenious devices for studying such respiratory mechanisms are described. A comprehensive section covers the mechanisms in aquatic mammals, in which great pressure differences come into play. Another valuable section of the book considers the gas transporting mechanisms of the blood in hemoglobin and hemocyanin containing forms, including the adaptations to high altitude, to low oxygen tension and to high pressures. The book brings together a wealth of material from obscure sources of great value in understanding better the respiratory mechanism in man.

A Review of the Psychoneuroses at Stockbridge. By Gaylord P. Coon, M.S., M.D., Chief Medical Officer, Boston Psychopathic Hospital, Boston, and Alice F. Raymond, A.B., Statistician, Department of Child Hygiene, Harvard School of Public Health, Boston. Cloth. Pp. 299. Stockbridge, Massachusetts: Austen Riggs Foundation, Inc., 1940.

This book is an analysis of cases treated at Stockbridge between 1910 and 1934. In the twenty-five year period the effect of changing therapy is apparent. The clinical records have been amplified by correspondence and follow-up visits. The individual case reports are few, but 1,060 cases out of 5,300 were reviewed. In general, the patients were psychoneurotic, for Dr. Rigg's practice was confined to this type of patient for many years. When the Riggs Associates was formed in 1937, it carried on the work of the Austen Riggs Foundation, which had been established in 1917 for the service of patients who were unable to pay the usual fees of private psychiatrists. Miss Raymond and Dr. Coon describe the limitations of the psychoneurotic and of the classification of "psychoneurosis" early in the book. They discuss the difficulties of differential diagnosis and the methodology of treatment at Stockbridge. There the feeling has been strong that (a) a balance of the day's activity, (b) the habit of accepting reality, (c) the habit of living in the present and (d) a consistent purpose expressed in useful work are ideals which are of maximum importance in directing a patient to a resumption of an integrated behavior pattern. Reeducation at Stockbridge appears to have a place midway between the persuasive method of Dubois (so called) and the psychobiologic approach of Adolf Meyer. The book testifies to the perception and analytic skill of the authors.

Las artritis gonocóccicas agudas: Su diagnóstico y tratamiento médico. Tesis de doctorado de Enrique A. A. Pierini. Universidad nacional de Buenos Aires, Facultad de ciencias médicas, N.º 5314. Paper. Pp. 339, with 52 illustrations. Buenos Aires: Imprenta de Alfredo Frascoli, 1940.

The author selected the subject of diagnosis and medical treatment of acute gonorrheal arthritis for his doctoral thesis. The various chapters cover clinical forms, symptoms, course, diagnosis, prognosis and pathologic anatomy of acute gonorrheal arthritis; clinical, roentgen and differential diagnosis and the various methods of medical, surgical and physical treatments, vaccines and local antigonorrheal serotherapy. The sixth chapter is a report of clinical results obtained from local antigonorrheal serotherapy. The book ends with forty-five pages of bibliography.

Urban Housing and Crowding: Relation to Certain Population Characteristics as Indicated by National Health Survey Data. By Rollo H. Britten, Senior Statistician, and J. E. Brown, Assistant Statistician, U. S. Public Health Service. From the Division of Public Health Methods, National Institute of Health. Prepared by direction of the Surgeon General. Federal Security Agency, U. S. Public Health Service. Public Health Bulletin No. 261. Paper. Price, 15 cents. Pp. 123, with 5 illustrations. Washington, D. C.: Supt. of Doc., Government Printing Office, 1941.

The obvious is thoroughly demonstrated by diagrams and statistics in this study. It is proved beyond doubt that crowding is much worse in the lower than in the higher income class, among Negroes rather than white persons, with large families more than small, in residencies with low rentals rather than high, in rented greater than in owner occupied, and in general was less in the West than in the Northeast and South. Possibly a housing program might find some of these figures valuable, but they certainly reveal nothing new.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

STERILIZATION OF CATGUT

To the Editor:—What solutions are commonly employed inside the ampules which contain suture material? Are any of them to be particularly recommended? Have any of them been condemned? I have often noticed a smell of benzene when breaking such an ampule. What is the origin of this odor? Does the ampule contain free benzene? I notice in Johnson and Johnson's advertisements that they use 95 per cent alcohol with potassium mercuric iodide. Is either the alcohol or the mercuric salt capable of irritating tissues? Do you have a record of the solution employed at the present time by Bauer and Black? Is there a listing of approved sutures? What is the difference between boilable and non-boilable sutures? What would happen if one were to boil a nonboilable suture?

Percy J. Delano, M.D., Chicago.

ANSWER:—These questions cannot be answered satisfactorily without reference to the fundamental problem of the sterilization of catgut. It has been abundantly demonstrated that chemical agents alone cannot be relied on to sterilize catgut; heat must be used, and in a manner which will not spoil the material for surgical purposes.

"Boilable" catgut is first dehydrated, is then placed in sealed glass tubes containing an inert, anhydrous liquid, and finally is subjected to high temperature for long periods (e. g. 165 C. for five hours). The tubing fluid ordinarily used for this type of gut is xylene (dimethylbenzene) or toluene (methylbenzene), since both of these substances possess desirable qualities of colorlessness, stability, volatility and low toxicity (Bauer and Black use pure xylene or toluene for "boilable" catgut, and 95 per cent alcohol denatured with agents such as potassium mercuric iodide or phenyl mercuric benzoate for "nonboilable" catgut). Boiling or autoclaving these tubes before operation does not injure the enclosed gut and is recommended for the purpose of sterilizing the outer surface of the glass. It is a mistake, however, to think that any lack of sterility within the tubes can be rectified by such procedures, for temperatures of 120 C. or less for fifteen to twenty minutes cannot be depended on to kill sporulating organisms suspended in inert anhydrous mediums. This is one reason why it is imperative that all tubed catgut on the open market should be unquestionably sterile. When "boilable" catgut has been removed from its tube, the liquid quickly evaporates, leaving the strand perfectly dry and rather stiff. A desirable degree of pliability may be restored slowly by immersing the gut in 95 per cent alcohol, more rapidly by dipping it in physiologic solution of sodium chloride, and most rapidly of all by using first alcohol and then salt solution. This softening, which is due to the taking up of water by the dehydrated gut, may reduce the tensile strength slightly; but it is a process which occurs anyhow as soon as the catgut is buried in tissues.

The advantage claimed for "nonboilable" catgut is that the strand comes from the tube already soft and pliable. More steps are required in its manufacture, however, which of necessity increase the difficulty of producing a uniformly sterile suture material. The accepted method is to dehydrate the gut, sterilize it in open tubes by heat in an anhydrous medium such as cumene, drain off this liquid, add an antiseptic fluid and finally seal the tubes hermetically. The tubing fluid ordinarily used for "nonboilable" catgut is 95 per cent alcohol containing potassium mercuric iodide or some similar denaturing agent. In case of catgut affixed to needles in the tube at least one company (Davis & Geck) uses as tubing fluid anhydrous ethyl alcohol containing 0.5 per cent benzene and 0.2 per cent thymol. Irritation of tissues by these chemicals is probably unusual, especially if the catgut is rinsed in salt solution before use. "Nonboilable" catgut should not be boiled, because "the collagen of the suture in the presence of moist heat is partially converted into gelatin, thereby destroying the tensile strength and rendering the suture brittle" (Manual of Surgical Sutures and Ligatures, Brooklyn, Davis & Geck, Inc., 1935). It is necessary therefore to attempt to disinfect the outside of "nonboilable" catgut tubes by submerging them for adequate periods in germicidal solutions.

Beginning Jan. 1, 1941 the Federal Food and Drugs Administration assumed control over sterile surgical supplies (including catgut) manufactured for sale (Meleney, F. L.: Sterile Surgical Supplies, editorial, *Surgery* 8:884 [Nov.] 1940). Offi-

cial standards for sterility of catgut are indicated in the latest Supplement of the U. S. Pharmacopeia (Second Supplement to the Pharmacopeia of the United States, Eleventh Decennial Revision, Easton, Pa., Mack Printing Company, 1919, pp. 40 and 124). Efforts are being made to have these standards extended to include qualities of tensile strength and absorbability. Perhaps this will lead to further standardization of tubing fluid also. It is already required that each package of catgut shall state "the lot number identifying the methods and the time of sterilization of the gut, and the composition of any tubing fluid used." But as yet there is no official listing of approved sutures or of those firms whose catgut measures up consistently to the standards already established (Brewer J. H.: The Present Status of the Sterility of Catgut Sutures on the American Market, *THE JOURNAL*, Feb. 27, 1937, p. 722).

TREATMENT OF SEROLOGICALLY NEGATIVE SYPHILIS IN PREGNANCY

To the Editor:—A white woman aged 30, a primigravida, had a chancre and secondary rash in 1932. Blood tests for syphilis gave positive results at that time. The patient had intensive treatment with arsenicals and bismuth compounds (exact amounts not known) from 1932 until 1935 by a competent dermatologist. Her blood serum and spinal fluid became normal and have remained normal since 1935. At the present time she is two and one-half months pregnant. The Kahn, Kline and Wassermann reactions of the blood are all negative. The Kahn, Kline and Wassermann reactions as well as the colloidal gold reaction of the spinal fluid are negative. There are 1 to 2 cells per cubic millimeter of spinal fluid. Protein is not increased by the Pandy test. There are no clinical or neurologic signs of syphilis. Should this patient receive antisyphilitic therapy? If so, what type? What are the reasons for this recommendation? As a corollary to this, what is the rationale for the statement "A syphilitic woman should have treatment during each and every pregnancy, regardless of the serology and state of the disease?"

M.D., Nebraska.

ANSWER:—The patient has apparently had good treatment in the past for her syphilis, and the chances are good that even if she was not to have treatment there would be no difficulty.

The situation with a pregnancy, however, is somewhat different from what it is with the ordinary contacts in life, even sexual intercourse. It is generally understood that a biologic cure in syphilis probably is extremely difficult. A clinical cure and even a cure of the disease to such an extent that laboratory tests will no longer show any evidence of the disease is not out of the question. However, it is possible that such patients may still have a few stray organisms lodged away somewhere in the haversian canals or in some of the lymph nodes, and under the unusual stimulation that goes on in connection with a pregnancy it might be possible that a few of these organisms would get into the blood stream, and through the intimate contact between the fetus and the mother, by way of the placenta, it would be possible for some of them to lodge in the placenta and be carried through into the circulation of the fetus.

It is for this reason that the patient should have antisyphilitic treatment throughout her pregnancy.

Perhaps some time in the future sufficient statistical data will have been gathered to show that this is not necessary. Thus far, however, it has not been done.

A patient like the one described may be given a course of injections of mapharsen, each 40 mg., given once a week for a period of ten treatments. This may be followed with a short course of intramuscular injections of bismuth subsalicylate and a course of injections of mapharsen, the treatment being given right up until delivery.

ALLERGY AND EPINEPHRINE SENSITIVITY

To the Editor:—A patient with asthma is sensitive to many things: house dust, orris root powder, oranges and other substances. One cc. of epinephrine is the only thing which relieves her asthma. Three months ago she received four injections of 1 cc. of epinephrine with only slight palpitations of short duration. On March 1 another attack of asthma occurred. I gave her 1 cc. of epinephrine. (I am sure the injection was not in a blood vessel, as I always pull the plunger before giving an injection.) Such severe palpitations developed that it was hard for her to breathe. They lasted one and one-half hours until finally I gave her pentobarbital sodium and the palpitations subsided. I do not dare to give her epinephrine. Ephedrine does not help her.

M.D., Michigan.

ANSWER:—The inquiry does not give sufficient information regarding the full details of the patient's allergy; i. e., the history in detail and a complete study made including complete cutaneous tests, for a thorough answer regarding management. In general, those things which have been mentioned of an environmental nature, house dust and orris root, can and should be eliminated by the use of cosmetics free from orris root and of impervious covers over the mattress and pillows. Other precautions against house dust, especially in the bedroom, by

the elimination of drapes and upholstered furniture, should likewise be taken. It may be necessary to treat with those environmental substances to which the patient is sensitive and which cannot be thoroughly eliminated. It is presumed that the foods to which the patient reacts and to which she is clinically sensitive have been eliminated from her diet. As for the reaction described to injections of epinephrine, the amount given with each injection, 1 cc., is in most cases considered excessive. Generally speaking, 0.3 to 0.5 cc. of a 1:1,000 solution of epinephrine is all that should be given. If no relief is obtained from that dose, none will usually be obtained from a larger dose. All that will result from giving a larger dose are the undesirable side effects of epinephrine which are partly described in this case. It is not uncommon if a patient is in contact with a substance to which he is sensitive to find that epinephrine fails to give relief. Thus a patient sensitive to feathers, sleeping on unprotected feather pillows, will have no relief from solution of epinephrine. This is likewise true of many pollen-sensitive patients during the season for pollen. It might be well to try, for relief in this case, epinephrine in oil or epinephrine in gelatin; 0.5 cc. of either of these two solutions may be injected deep, subcutaneously or intramuscularly. For better results, 0.2 to 0.3 cc. of an aqueous solution of epinephrine (1:1,000) may be used immediately preceding the oil or gelatin suspension of this drug. If this is done, the injections are given separately and at different sites. Generally, if aqueous solution of epinephrine fails to give relief the oil suspension likewise fails to give relief. Another suggestion in severe attacks if epinephrine does not work is the slow intravenous administration of $7\frac{1}{2}$ grains (0.5 Gm.) of aminophylline.

PYORRHEA ALVEOLARIS

To the Editor:—What is the cause of pyorrhea alveolaris? In a fairly well advanced case with recession of the jawbone but with no dental or gingival symptoms, is there any local treatment or general treatment that might arrest the progress of the disease? Are calcium and vitamin D of any avail?

Angeline Mary Piscitelli, M.D., San Francisco.

ANSWER.—The causes of pyorrhea alveolaris are generally unknown, but it is suspected that a combination of local trauma or irritation and a subclinical systemic deficiency of unknown type may be etiologic factors.

In the absence of dental or gingival symptoms the implication is that the cause may be chiefly systemic. However, studies on calcium and ascorbic acid in the blood, as well as other blood chemistry, have generally failed to show deviation from the normal.

Slight but gradual recession of the gums and alveolar bone is a normal senile change in older persons, associated with the continuous though slow eruption of the teeth. It should not be confused with pyorrhea alveolaris (periodontoclasia). The age of the patient is therefore important in the diagnosis.

Local treatment consisting of thorough sealing and removal of all irritating factors, such as calculus and detritus, is always indicated, as well as thorough medical examination and dietary analysis. Unfortunately this procedure is frequently not effective. Calcium and vitamin D therapy are indicated only when the systemic condition warrants such treatment. Surgical resection is not indicated in the absence of gingival symptoms.

HEMOGLOBIN DETERMINATION BY SANFORD-SHEARD METHOD

To the Editor:—What is the accepted value of normal blood by the Sanford-Sheard method of hemoglobin determination expressed as the amount in grams per hundred cubic centimeters of blood?

J. A. Mease Jr., M.D., Dunedin, Fla.

ANSWER.—The Sanford-Sheard instrument reads in grams of hemoglobin per hundred cubic centimeters. It is checked by the oxygen capacity method of determining hemoglobin and so should give the same readings as other accurate standard procedures. Several large series of hemoglobin determinations in normal persons have been reported with little variation in the average results. These run from 15 to 16 Gm. per hundred cubic centimeters. Sanford has stated that 16 Gm. is his average value.

In any method of determining hemoglobin the most satisfactory procedure is to determine for each laboratory the average value of hemoglobin in grams per hundred cubic centimeters for a normal red cell count of 5 million by the method used. This can be done accurately enough for all practical purposes by the careful study of at least 10 normal persons. The figure so determined is then taken as 100 per cent. The color index using this figure as 100 per cent should be 1.00 within the limits of error in normal persons.

ULTRAVIOLET RAYS AND THE SKIN

To the Editor:—Is there any danger from regular and repeated use of ultraviolet rays long enough to cause mild reddening of the skin followed by desquamation? A woman aged 29 had benefit to a cutaneous eruption with the General Electric sunlamp. The eruption appears as single pustules resembling acne, leaving a faint pitting. Pustules and pitting have been benefited. Eller and Wolff's article on skin peeling in *The Journal* seems to explain the action.

M.D., Maine.

ANSWER.—One of the chief functions of the human skin is protection of the underlying tissues against the action of light. Normal skin is able to do this without being injured by the light, even though it is rather intense, provided the intensity comes on gradually. Repeated mild erythema doses of ultraviolet rays will not harm it. Only skins which are defective and lack the power of developing resistance to light can be harmed by such exposure. Such skins can usually be recognized by their inability to form pigment, freckling instead of tanning. These should not be exposed to strong light if it can be avoided, for fear that senile keratoses will develop, which are often the precursors of epithelioma. Such skins are not common. The patient mentioned in the query evidently profits by the treatment and there is little likelihood of injury.

EARLY TABES OR MENINGOVASCULAR SYPHILIS

To the Editor:—A man aged 43 has 3 plus blood and 4 plus spinal fluid Wassermann reactions after having had over thirty nearsphenamine, sixty bismuth and recently over ten tryparsamide injections. His pupils are unequal and do not react to light. His knee jerk reflexes react sluggishly; the blood pressure is 100 over 70; no cardiovascular abnormalities are demonstrable. He has no complaints other than fatigue and insomnia. He refuses malaria fever therapy as well as any further spinal tests. What therapy can be used to prevent progression of his disease if not a cure? How much tryparsamide may be used in this type of case—for how long and should one allow rest periods? Are iodides of any value and, if so, what dosage?

Irving I. Crouse, M.D., Buffalo.

ANSWER.—If the patient's pupils are unequal and do not react to light and the reflexes are sluggish, he has symptomatic rather than asymptomatic neurosyphilis. Whether he has early tabes dorsalis or meningovascular neurosyphilis cannot be determined from the information furnished. If the spinal fluid is showing a severe degree of involvement, that is, the so-called parietic formula, the patient, barring contraindications, should have fever therapy. In view of his refusal to undergo such treatment, the continued use of tryparsamide and bismuth compounds is warranted. These drugs may be given concurrently, ten injections of each to a course, with a two month rest interval between courses, and effort should be made to give at least seventy-five injections of each drug. The use of iodides is advisable, giving up to 50 minims (3 cc.) three times a day if tolerated, otherwise maintaining as high a dose as the patient can comfortably take.

CONVALESCENT SCARLET FEVER SERUM

To the Editor:—In *The Journal*, Feb. 8, 1941, in the article "Chemotherapy of Infectious Diseases and Other Infections, Circular Letter 81," under Medical Preparedness, I notice the omission of the use of convalescent scarlet fever serum in the prevention and treatment of scarlet fever. Why do the "authorities" omit convalescent scarlet fever serum from the circular letter?

Harry G. Rotman, M.D., Jasonville, Ind.

ANSWER.—Convalescent scarlet fever serum was not included in circular letter 81 because its prophylactic use was not considered feasible in large numbers of persons and its field of therapeutic usefulness is still limited by the available supplies.

It is questionable whether widespread prophylaxis in scarlet fever is practicable in army camps, and there seems to be no great advantage for convalescent serum over the commercial serums which are now on the American market. This entire question, however, is subject to later modification if the evidence warrants.

CITRATES AND CORONARY THROMBOSIS

To the Editor:—I am puzzled by an answer to a query in the March 29, 1941, issue of *The Journal*. To the question of whether citrates were helpful in coronary thrombosis the answer was that the anticoagulant properties of the citrate radical were nullified. Since when does the citrate radical have such properties? So far as I know in regard to calcium and citrate the calcium radical is the determining one in blood coagulation. With the formation of a "relatively insoluble calcium citrate" less calcium is available for coagulation and hence coagulation is decreased. In the experiments in which sodium citrate was shown to increase coagulation, concentrations of 10 per cent were used. Concentrations of citrate over 3 per cent given intravenously may be toxic perhaps because of the destruction of platelets. In 2 per cent solution sodium citrate by vein decreases blood viscosity. (Bernheim, Alice R., and London, Isobel M.: Arteriosclerosis and Thromboangiitis Obliterans, *The Journal*, June 19, 1937, p. 2102). We have recently found that sodium citrate by mouth does increase citric acid in the blood.

THE DIAGNOSIS AND TREATMENT OF ACHYLIA PANCREATICA

J. M. BEAZELL, PH.D., M.D.

C. ROBERT SCHMIDT, PH.D., M.D.

AND

A. C. IVY, PH.D., M.D.

CHICAGO

Studies on the effect of achylia pancreatica on digestion and absorption in experimental animals have been numerous and consistent. It has been clearly demonstrated that exclusion of pancreatic juice from the intestine results in a decided increase in the quantity of fat and nitrogen,¹ starch² and the total carbohydrate³ eliminated in the feces. In view of the uniformity of these results, the negative results reported by some of the older workers⁴ can be attributed to a simple failure to exclude all pancreatic juice from the intestine.⁵

Reports on the value of substitution therapy in experimental achylia pancreatica have not been entirely harmonious. Pratt, Lamson and Marks,⁵ Cruickshank,⁶ Nasset, Pierce and Murlin,⁷ Selle⁸ and Schmidt, Beazell, Crittenden and Ivy⁹ all observed a significant reduction in the quantity of nitrogen wasted in the feces

The Wilson Laboratories, Chicago, supplied the pancreatin used throughout this study.

From the Department of Physiology and Pharmacology, Northwestern University Medical School.

Dr. Paul Wosika of Chicago, Dr. H. T. Rickett of Billings Hospital, University of Chicago, and Dr. D. R. Cunningham of Winnetka, Ill., each placed at our disposal 1 patient.

when adequate substitution therapy was instituted. Coffey, Mann and Bollman,¹⁰ on the other hand, were unable to demonstrate any specific effect. In agreement with Selle⁸ the latter authors also found that enzyme therapy was without effect on the quantity of fat wasted in the feces. In contrast, Schmidt, Beazell, Crittenden and Ivy,⁹ Pratt, Lamson and Marks⁵ and Cruickshank⁶ all reported that oral enzyme therapy had a decidedly favorable effect on fat utilization. We² found that substitution therapy effected reductions in fecal starch as great as 50 per cent. Coffey, Mann and Bollman¹⁰ obtained similar results in studies on the utilization of total carbohydrate.

Clinical studies on the effect of achylia pancreatica on food utilization and on the effect of enzyme therapy have been surprisingly consistent. With few exceptions it has been reported that achylia pancreatica is characterized by a noticeable failure in the absorption of both fat and nitrogen and that substitution therapy is of demonstrable therapeutic value. Observations on certain well studied cases reported in the literature, in which the effect of substitution therapy was determined, are summarized in table 1. The results obtained during control periods illustrate the magnitude of the disturbance in digestion and absorption that occurs when pancreatic juice is excluded from the intestine in man.

Since the number of well studied patients are few, and since oral pancreatic enzyme therapy in man is not generally considered to be of value, a view that is inconsistent with most of the results of animal experimentation, we have undertaken to determine the effectiveness of oral pancreatic enzyme therapy in human patients with achylia pancreatica.

We have carefully studied 4 patients in whom a definite diagnosis of achylia pancreatica has been established and have observed the effect of the oral administration of pancreatic enzymes on them for from a few months to three and a half years.

BRIEF HISTORIES OF THE PATIENTS STUDIED

The following brief reports include the significant information gained from the history and the examinations made prior to our study:

CASE 1.—W. M., a white woman aged 65, in August 1938 complained of frequent bulky stools, loss of 22 pounds (10 Kg.) and extreme inanition. The symptoms had originated insidiously about nine years earlier. She had been under treatment for diabetes mellitus since 1931, but in spite of satisfactory control of the diabetes (insulin 15-5-15 units) she had continued to lose weight and strength.

Aside from emaciation and irregular, sluggish pupils, physical examination gave essentially negative results. Urinalysis revealed sugar ++, pus cells ++ and albumin a trace. The

10. Coffey, R. J.; Mann, F. C., and Bollman, J. L.: Substitution Therapy in Experimental Pancreatic Deficiency, *Am. J. Digest. Dis.* 7:149 (April) 1940.

red blood cell count was 4,130,000, the hemoglobin content 11 Gm. and the white blood cell count 8,000. The Wassermann reaction of the blood was + + + + and of the spinal fluid negative. She had received intensive antisyphilitic therapy nine years and a course of bismuth two years prior to our study. The dextrose tolerance curve was of the diabetic type. Gastrointestinal roentgenograms revealed no abnormalities.

CASE 2.—B. D., a white man aged 62, in July 1940 complained of frequent bulky stools, loss of 40 pounds (18 Kg.), and weakness. These symptoms had developed insidiously during the summer of 1939. Diabetes mellitus, diagnosed in June 1940, had been readily controlled with moderate dietary restrictions and protamine zinc insulin 10 units before breakfast.

Aside from the evidences of loss of weight, physical examination gave essentially negative results. The urine contained albumin ++ but was otherwise normal. The red blood cell count was 4,350,000, the hemoglobin content 12.4 Gm. and the white blood cell count 8,500. The Wassermann reaction was negative. Roentgenograms of the abdomen revealed extensive calcification in the region of the pancreas.

CASE 3.—W. E., a white man aged 63, in June 1937 complained of loss of weight (35 pounds, or 16 Kg.), moderate weakness and frequent bulky stools. In May 1934 the patient had had a severe acute illness diagnosed as acute pancreatitis. About one year later, in the absence of other symptoms, an increase in the frequency and volume of the stools followed by loss of weight and strength occurred. At the time of the change in the character of the stools a roentgenologic diagnosis of pancreatic calculi was made.

Aside from the evidence of loss of weight, physical examination and urinalysis revealed no abnormalities. The red blood cell count was 4,850,000, the hemoglobin content 14.3 Gm., and the white blood cell count 11,200. The blood sugar was 75 mg. per hundred cubic centimeters and the Wassermann reaction was negative.

CASE 4.—D. K., a white man aged 40, in February 1937 complained of frequent bulky stools, a loss of 50 pounds (22.7 Kg.) and severe weakness. About three years previously the patient had had an acute attack of pain in the upper part of the abdomen associated with chills, fever, nausea, vomiting and jaundice. This initial attack was followed by a series of similar episodes, some of which were accompanied by ascites and edema. When we saw the patient he had been free of acute symptoms for about six months, but the abnormal stools and loss of weight and strength had continued unabated.

Aside from evidence of a striking loss of weight, physical examination and urinalysis revealed no abnormalities. The red blood cell count was 4,120,000, the hemoglobin content 11.2 Gm. and the white blood cell count 8,700. The Wassermann reaction was negative.

In all 4 of these cases a clinical diagnosis of chronic pancreatitis appears to be justified. In 2 cases (3 and 4) the chronic changes apparently resulted from a preceding acute pancreatitis associated with pancreatic calculi. In case 2 calcification in the absence of acute symptoms suggests a degenerative process rather than obstruction of the duct by calculi. Case 1 probably represents a primary chronic pancreatitis, possibly on a syphilitic basis. It is interesting that the extensive damage to the acinar portion of the pancreas present in all 4 of these cases was associated with concomitant islet damage of sufficient severity to produce diabetes in only 2.

The history and signs presented by these 4 cases warranted a clinical diagnosis of pancreatic achylia. However, in each case an unequivocal diagnosis was established by demonstrating (1) an absence of pancreatic enzymes in the duodenal drainage, (2) an increase in the quantity of both nitrogen and fat in the feces and (3) a reduction in the wastage of both nitrogen and fat with substitution therapy.

We believe that these laboratory determinations are essential for the absolute diagnosis of uncomplicated pancreatic achylia.

LABORATORY PROCEDURES

1. *The Determination of Enzymes in Duodenal Drainage.*—Methods: After testing all the more promising of the enzyme methods we have adopted the following as the most satisfactory of the available tests: amylase (Willstätter's method¹¹), lipase (Cherry and Crandall's method¹²) and trypsin (Northrop's non-protein nitrogen method¹³). In routine examination of the duodenal fluid, 1 part of a satisfactory (clear and definitely alkaline to litmus) specimen is diluted with 24 parts of p_H 7.0 buffer; 1 cc. of this mixture is used for the determination. When an enzyme deficiency is suspected, the duodenal fluid is diluted with only 4 parts of buffer solution. Because amylopsin is destroyed rather rapidly, the enzyme assay should be carried out immediately. If this is not practical, the duodenal fluid should be iced during storage. In no case should the analysis be delayed for more than a few hours.

Results: In all 4 patients there was a total absence of enzyme activity in the duodenal fluid. It should be emphasized that these are the only patients we have encountered for whom this has been true. (The methods are so designed that they would fail to detect the relatively feeble enzymes present in most body fluids and which might be expected to be present in the duodenal fluid in the absence of pancreatic secretion.)

2. *The Determination of Protein and Fat Loss in the Stool.*—Methods: The studies on intestinal absorption and the effect of enzyme therapy have all been conducted in the following manner: The patient is placed on a standard balanced diet supplying 64 Gm. of protein (10.3 Gm. of nitrogen) and 112 Gm. of fat daily for a period of six days. Carmine 5 grains (0.33 Gm.) is given with the first meal on the standard diet, again with breakfast on the fourth day and finally with the first meal after the standard diet has been discontinued. Starting with breakfast on the fourth day, the patient is given with each meal 8 Gm. of potent pancreatin in the form of enteric coated tablets. At the time of the appearance of the first dose of carmine in the stool, collection of the total fecal output is initiated and continued until the last dose of carmine makes its appearance. The carmine given on the fourth day serves to separate the control period from the enzyme period. Immediately after passage the feces are transferred to an air tight bottle containing 5 cc. of toluene and stored in a refrigerator. Each day the total fecal output for the preceding twenty-four hours is weighed, thoroughly mixed and sampled for chemical determinations. The samples for each period (control and enzyme) are pooled and the determinations are carried out on the composite samples. The samples for the nitrogen determination are suspended in sulfuric acid as recommended by Peters and Van Slyke;¹⁴ samples for the determination of fat are preserved in alcohol, which is then used for the initial lipid extraction. Nitrogen is determined by the Kjeldahl method and fat by a modification of Saxon's method.¹⁴ All determinations are conducted in dupli-

cate. No information of definite diagnostic value is obtained by determining the ratio of undigested fat (neutral fat) to digested fat (soaps and fatty acids). It has been shown that even in the absence of pancreatic digestion the ratio may be normal.¹⁵

Results: The results of the absorption studies on the four patients are summarized in table 2. Using the same experimental procedure on normal human subjects on somewhat more liberal diets, we have found the average daily fecal nitrogen to range between 1.5 and 2.3 Gm. and the average daily fecal lipids between 7 and 10 Gm. As is well known, the fecal nitrogen and fat of the normal subject are largely of metabolic origin.¹⁶

Most of the conclusions to be drawn from an examination of table 2 are self evident. Substitution therapy effected an average reduction in fecal nitrogen

nitrogen balance was actually negative to such an extent, it is probable that the absorption period was too short (three days) to average out fully the error due to daily variation; i. e., since the quantity of fat or nitrogen excreted in the feces is sometimes subject to relatively wide daily variation, the control test in this patient may have been obtained during a period when nitrogen excretion was greater than average. (Where it is practical, this source of error can be largely eliminated by extending the absorption period to five or more days.) This consideration in no way invalidates the results obtained on this patient. The difference between control and enzyme periods is far greater than could be attributed to daily variation.

3. *Treatment: Results of the Oral Administration of Pancreatin.*—The pancreatin used throughout this study possessed the following activity: trypsin from 50 to 100

* The pancreatin administered during the enzyme period contained 2.98 Gm.
† During this period 13.28 Gm. of nitrogen was ingested.

of 62 per cent and in fecal lipids of 63.3 per cent. When one thinks of this effect in terms of conserved calories the results are extremely striking. Therapy resulted in an average reduction in fecal nitrogen of 4.85 Gm. In terms of protein, this represents 30.1 Gm. (4.85 × 6.2), or 123 calories (30.1 × 4.1). Therapy resulted in an average reduction in fecal fat of 47.1 Gm., or 424 calories (47.1 × 9). Thus, an average of 547 calories a day, which would otherwise have been wasted, was made available when therapy was instituted. The saving in vitamins (particularly the fat soluble vitamins), minerals and essential amino acids can only be surmised.

It will be noted in the case of patient W. M. that during the control period the average quantity of nitrogen eliminated in the feces was greater than the quantity ingested. Since it appears unlikely that the

per cent above U. S. P. specifications, lipase 2,200 Cherry-Crandall units per gram, and amylase 7.2 Willstatter units per gram. It compares favorably in potency with the best products that we were able to obtain. Of eight products bought at local drug stores and tested, two were essentially inactive and two possessed little more than half the activity of the preparation used.

Immediately after completion of the various tests the patients were placed on a high caloric, high protein, low fat, low residue diet and 8 Gm. of pancreatin, in the form of enteric coated tablets, with each meal, or a total daily dose of 24 Gm. Half of the pancreatin was taken immediately before and half immediately after the meal. Compared to the conventional dose of pancreatin, this quantity is of course tremendous. In terms of replacement therapy, however, it is not so impressive. The pancreatin that we have employed is approximately ten times as potent, weight for weight, as average pancreatic juice. The total daily dose of 24 Gm. corresponds,

15. Bodansky, Meyer, and Bodansky, Oscar: Biochemistry of Disease, New York, Macmillan Company, 1940, p. 207.
16. Lusk, Graham: The Elements of the Science of Nutrition, ed. 4, Philadelphia, W. B. Saunders Company, 1928, p. 49.

therefore, to approximately 240 cc. of pancreatic juice. This represents only about 15 per cent of the quantity normally estimated to be secreted in twenty-four hours. The initial dose of pancreatin was maintained for one month. Thereafter the daily dose was progressively reduced until, as evidenced by subjective reactions and the character of the stool, a satisfactory maintenance dose was obtained. This has varied among the patients between 2 and 3.3 Gm. with each meal. It is worthy of note that none of the patients have manifested any inclination to revolt against the large dose.

Because it was not specifically indicated, no other form of treatment was instituted. In general, at least temporary supplementation of the diet with vitamins and minerals would appear to be indicated. Indications for other therapeutic measures would, of course, vary with the individual case.

Response to treatment occurred early. As can be judged from table 2, the bulk of the stools was reduced within twenty-four hours. Within the same period of time there was a reduction in the frequency of stools. Gains in weight, reflected by increased strength, were noted within a few days. Patients B. D., M. M. and W. E. are still under observation after periods of six months, a year and a half and three years respectively. D. K. met an accidental death after two and a half

celiac disease, exclusion of bile from the intestine and other conditions characterized by bulky stools. The presence in the stool of many meat fibers along with large amounts of fats and soaps is presumptive evidence that there is significant impairment in the digestion and absorption of protein as well as of fat. In certain cases, however, we have found that chemical analysis for nitrogen failed to confirm the impression derived from microscopic examination of the stool. The bulk of the stool nitrogen is in a form having no morphologic characteristics, i. e. protein in all stages of degradation. In certain cases of "simple" diarrhea (enteritis, colitis) we have found large quantities of meat fiber when the total nitrogen was only slightly greater than normal. Thus it appears that, as an index of total nitrogen, the presence of meat fibers in the stool may be misleading.

As was noted previously, unequivocal diagnosis of pancreatic achylia is possible only when it can be shown that there is an absence of pancreatic ferments in the duodenal drainage, an excess of both fat and nitrogen in the stool and a response to substitution therapy. Theoretical considerations as well as experience have led us to emphasize the importance of the latter determination. We have never seen pancreatic achylia either clinically or in an experimental animal which failed to respond to adequate enzyme therapy. Conversely, in the absence of demonstrable pancreatic insufficiency, we have never seen enzyme therapy effect a reduction in the nitrogen or fat of the stool.

In all cases starch granules, as revealed by microscopic examination, were less abundant in the stools than would be anticipated on the basis of the insufficiency of digestion of protein and fat. This is probably due to two factors: First, salivary and intestinal amylase are both relatively potent hydrolytic agents, so that even in the absence of pancreatic juice significant starch hydrolysis can occur. Second, starch reaching the colon is rather rapidly destroyed by bacteria. The latter fact probably accounts for the distressing colonic flatulence complained of by two of the patients prior to the institution of pancreatin therapy.

It is to be noted that all of the patients discussed in this communication were adults. However, Andersen¹⁸ has shown that, in children, the achylia pancreatica due to cystic fibrosis of the pancreas will respond to adequate pancreatin therapy.

SUMMARY

A review of the literature reveals that it has been conclusively shown that exclusion of pancreatic juice from the intestine in experimental animals results in a decided impairment in the digestion and absorption of protein, fat and carbohydrate. Studies on the effect of enzyme therapy in experimental animals with achylia pancreatica have been less consistent, but there is abundant evidence that adequate therapy increases the utilization of all three of the major foodstuffs (protein, carbohydrate and fat). The few properly conducted clinical studies on patients with achylia pancreatica have uniformly shown that enzyme therapy effects a significant increase in the utilization of protein and fat.

In each of the four cases of achylia pancreatica studied the diagnosis was established by demonstrating (a) an absence of pancreatic ferments in the duodenal drainage, (b) an excess of both fat and nitrogen in the stool and (c) increased absorption of both fat and nitrogen when substitution (enzyme) therapy was instituted. Enzyme therapy decreased the quantity of fat excreted

TABLE 3.—Summary of Changes in Weight of Four Patients

Patient	Original Weight	Weight When First Seen by Authors	Period of Treatment, Months	Final Weight
W. M.	120	98	18	133
D. K.	190	140	2.5	155
W. E.	175	142	36	148
B. D.	190	150	6	174

In the case of patient W. E., 148 pounds represents a satisfactory weight, so an effort has been made to stabilize it at that level.

months of observation. Table 3 is a summary of changes in weight that have occurred in the various patients.

Prior to the institution of treatment weakness had forced W. M. and D. K. to abandon most of their normal pursuits, and because of asthenia their gait was titubant. Asthenia had also significantly restricted the activities of B. D. and W. E. Within a period of a few weeks after starting treatment all the patients were able to resume their normal activities.

COMMENT

Coope¹⁷ is of the opinion that in most cases pancreatic insufficiency can be diagnosed by relatively simple tests, the most important being visual examination of the stool. Certainly in many cases the relatively elaborate tests herein described are not vital to a diagnosis. Correlation of signs and symptoms with the impression gained from visual examination of a twenty-four hour specimen of stool may suffice for clinical diagnosis. If the original diagnosis is confirmed by the results of a therapeutic test (pancreatin therapy) it can be accepted with reasonable assurance. Certain cases defy exact diagnosis, however, unless full advantage is taken of the laboratory. It is only in pancreatic achylia that failure of fat utilization is paralleled by a concomitant failure in protein utilization. However, chemical analysis of the stool may be necessary to demonstrate this characteristic which distinguishes pancreatic achylia from sprue, idiopathic steatorrhea (nontropical sprue),

in the stool by an average of 63.3 per cent and the quantity of nitrogen by an average of 62 per cent. In all cases a clinical response to therapy was manifested within a few days. The response was characterized by a decrease in the frequency and bulk of the stools, associated with gains in weight and increased strength. Two of the patients who had been reduced to a state of semi-invalidism by loss of weight and inanition were able to resume their normal activities within a few weeks after treatment was instituted. The response of the other two patients was equally satisfactory but less dramatic, because the initial symptoms were less severe.

TOTAL THYROIDECTOMY IN THE TREATMENT OF DIABETES INSIPIDUS

HARRY BLOTNER, M.D.

AND

ELLIOTT C. CUTLER, M.D.

BOSTON

Considerable advance has been made in recent years in the physiology of the thyroid gland in relation to the other organs of internal and of external secretion. However, during the past forty-five years, clinicians have reported improved elimination of water in certain forms of nephritis by the administration of desiccated thyroid and more recently of thyroxine, alone or combined with solution of parathyroid.¹ No explanation for the effects noted has been forthcoming beyond the possibility that these drugs increase the mobilization and excretion of calcium. Early work has shown that there is a definite relation between the thyroid and the pituitary gland. As early as 1889 Rogowitsch² found alterations in the pituitary glands of thyroidectomized dogs and rabbits in the nature of an increase in certain elements in the glandular or anterior portion. Shortly afterward, Hofmeister,³ Gley,⁴ Pisenti and Viola,⁵ Schönemann⁶ and others reported changes in the pituitary body following removal or disease of the thyroid. Later, Herring⁷ observed after thyroidectomy an increased activity of cells in the pars intermedia and most striking changes in the nervous part of the posterior lobe and in the laminae forming the floor of the third ventricle. Strauss⁸ reported a patient aged 9 years, in whom diabetes insipidus developed which progressively disappeared at the age of 13 with the gradual onset of myxedema. Coronedi⁹ found a diminished volume of urine after thyroparathyroidectomy in dogs which in general was not much influenced by the ordinary diuretics, although thyroid produced severe diuresis. He considered the kidneys

to have a specific physiologic action pertaining to the internal secretion of the thyroparathyroid gland.

Recent studies on the pituitary gland also have suggested that the thyroid gland is involved in the excretion of water through the kidneys. Barnes, Regan and Bueno¹⁰ noted polyuria in dogs after the injection of solutions of the anterior lobe of the pituitary gland, and when thyroidectomy was done polyuria did not occur. Biasotti¹¹ confirmed these observations and also noted that the diuretic activity of the thyroid was shown anew in tests on dogs which received large doses of desiccated thyroid. Marine and Rosen¹² studied several instances of polyuria in rabbits which developed in connection with experiments on goiter produced by cyanide and alfalfa hay. The polyuria began within two days after the administration of small doses of potassium iodide was begun, and goitrous rabbits thus treated showed intense hyperthyroidism. In 1 instance the polyuria persisted for three months, at which time a thyroidectomy was performed and the polyuria gradually receded. However, when desiccated thyroid was administered, the polyuria recurred on the second day of treatment. Mahoney and Sheehan¹³ produced polyuria and polydipsia in dogs by occlusion of the pituitary stalk with a silver clip and noted that this effect was abolished by subsequent total thyroidectomy and reestablished by the oral administration of desiccated whole thyroid gland. Fisher and Ingram¹⁴ produced experimental diabetes insipidus in cats by interruption of the supra-opticohypophyseal tracts on both sides and found that the removal of the thyroid gland resulted in a diminution of the water exchange and that the subsequent feeding of thyroid brought on a severe diuresis which persisted for some time after the effect of the thyroid had worn off.

From a review of the literature, it appears that there is a relation between the thyroid and pituitary glands and that the thyroid gland is a factor in maintaining water balance and possibly plays a role in the regulation of the intake and output of fluid in patients with diabetes insipidus. It appeared of value to apply this knowledge clinically in the treatment of diabetes insipidus. Consequently, total thyroidectomy was performed in 1935 on 3 patients with diabetes insipidus. This paper reports the results obtained on these patients after a five year interval.

PLAN OF INVESTIGATION

The general plan of study included various observations made in each case before and after total thyroidectomy. The fluid intake and urinary output were measured daily for many months and periodically after the operations. The specific gravity of the urine was measured at intervals during the day. The basal metabolic rate was determined on thirty-eight, forty and sixty-four occasions in the respective cases. The plasma or serum was analyzed on many occasions for sugar, cholesterol, nonprotein nitrogen, protein, albumin, globulin, chlorides, calcium and phosphorus. The hemoglobin, red blood cell counts and hematocrits were determined. The result of the serum calcium determination taken before thyroidectomy in the first case

also a symptom in some cases of hyperparathyroidism. For this reason, one parathyroid gland was removed for investigation from the subsequent 2 patients. The thyroid and parathyroid glands were studied grossly and microscopically. The weight and the general condition of each patient were noted frequently.

CLINICAL MATERIAL AND REPORT OF CASES

The persons who were studied consisted of 1 woman aged 66 and 2 men aged 27 and 29. All had had diabetes insipidus for a number of years, and the degree of the polyuria and the polydipsia were well established over a long period of time. They were controlled with adequate amounts of solution of posterior pituitary

given intranasally or intramuscularly. All had gastric distress at times, which Blotner¹⁵ found frequently in cases of diabetes insipidus. The spinal fluids were not remarkable except for slight increases in the calcium concentration.¹⁶ The etiology was idiopathic in the woman's case and of postencephalitic origin in the

men's cases. The Wassermann and Hinton reactions were negative in each case. The men were confined to institutions for chronic conditions because of their neurologic disturbances and because of their helplessness. All were anxious to have the operation, with the hope that they might be relieved of the diabetes insipidus, and they were extremely cooperative in this investigation. The total thyroidectomies were performed by Cutler. Because of the results, the individual cases are presented:

CASE 1.—Mrs. M. A., a housewife aged 66, was studied in the wards of the hospital for the first time from June 18 to July 16, 1935, although previously she had been observed in the medical laboratory at regular intervals for a period of three years. Her chief complaint was severe thirst and great frequency of urination.

The present illness had begun six years previously, at which time she suddenly noted an insatiable thirst accompanied by abnormal frequency of urination during the day and night. She had been drinking and passing as much as and at times more than 12 to 14 liters. Solution of posterior pituitary administered intramuscularly or intranasally gave relief of the polydipsia and polyuria. The family and past histories were negative. She had been married forty-seven years and had had

eleven children. She went through the menopause uneventfully at the age of 41. The physical examination was negative except for great obesity. Her height was 5 feet (152 cm.) and her weight 209 pounds (95 Kg.). The skin was dry. The blood pressure stayed at about the level of 146 systolic and 72 diastolic. The diabetes insipidus appeared to be idiopathic because no signs of a tumor of the brain could be detected by physical examination, roentgenograms or lumbar puncture.

Many laboratory tests were made before operation; a summary of the results is given in table 1. The laboratory data were not remarkable except for an increase in the serum calcium and cholesterol and basal metabolism readings of +20 and +21 per cent on June 19 and 20. Electrocardiograms showed a preponderance of the left ventricle with a pulse rate of 72.

Thyroidectomy was performed on June 24. For the four days before the operation the intake of fluid ranged from 10,400 to 12,350 cc. and the volume of urine from 9,700 to 10,400 cc. Subsequently the intake and output of fluid have remained at the same level as before the operation. However, solution of posterior pituitary has been possibly a little more effective in controlling the diabetes insipidus than before.

The thyroid gland weighed 16.5 Gm. and contained a small calcified adenoma in the inferior pole. Microscopic examination showed considerable foci of fibrosis. The persisting thyroid follicles varied moderately in size and were mostly low cuboidal, in some places flat. There was considerable variation in staining of the colloid and there was some peripheral scalloping. Capillaries and smaller vessels were slightly congested. The stroma was slightly less discernible than in the normal gland. There appeared to be some hyperactivity of the thyroid gland.

15. Blotner, Harry: Gastric Analyses and Gastric Symptoms in Diabetes Insipidus, *Am. J. Digest. Dis.* 7: 73 (Feb.) 1940.

16. Blotner, Harry: The Calcium and Phosphorus in the Cerebrospinal Fluid in Diabetes Insipidus, *Am. J. M. Sc.*, to be published.

The patient has been readmitted to the hospital on six occasions for study for periods which ranged from two to four weeks. The various laboratory data since operation are also given in table 1. These data have not changed remarkably except that the blood calcium level has come down to normal. The cholesterol has remained at an elevated level, which Blotner¹⁷ has shown to occur frequently in diabetes insipidus. The basal metabolic rate was interesting in that it showed a temporary drop after thyroidectomy to -19 per cent without any change in the water balance. However, the metabolism has increased so that now it is about the same as before thyroidectomy without the administration of thyroid, as shown in table 2. Just what is the cause for this rise in metabolism is uncertain. However, it seems likely that there is some aberrant thyroid tissue present to account for this and for the unchanged water metabolism. The thyroid gland was examined carefully after operation and was found to be entirely removed with its capsule. However, the patient did not show any symptoms or signs of hypothyroidism after the operation, and her physical status has remained about the same.

Electrocardiograms taken Dec. 12, 1936 and April 23, 1940 have continued to show a preponderance of the left ventricle with a normal fourth lead. Seven foot roentgenograms of the heart showed no essential change in the measurements of the heart in nine months and again in five years after thyroidectomy, there being some cardiac enlargement which was present before the operation.

CASE 2.—L. C., a man aged 27, single, entered the hospital for the first time Aug. 28, 1935 and was discharged October 25. He too, had been observed previously for several years. He had post-encephalitic paralysis agitans and diabetes insipidus. His illness had begun ten years before when he had what appeared to be influenza and sleeping sickness. One year later he noted a staggering gait which became progressively worse. A year after that he began to have difficulty with his eyes, which would roll and become fixed in an upward or downward position for hours; these rollings are the typical oculogyric crises of paralysis agitans. Subsequently there appeared typical and progressive symptoms of paralysis agitans, and the patient began to drink and pass large quantities of water during the day and night. At times he voided from 12 to 14 liters a day, but the average was usually 8 to 10 liters. The polyuria and polydipsia were relieved by solution of posterior pituitary, but this gave him severe headaches. For the past seven years he had been taking daily five or six pills of stramonium, each containing $2\frac{1}{2}$ grains (0.16 Gm.). The difficulty in walking became progressively worse, and the ocular attacks were more frequent and of longer duration, often lasting for a whole day or even longer. The family and past histories were essentially negative. The patient's weight had been 145 pounds (66 Kg.) about four years previously, and the present weight was about 124 pounds (56 Kg.).

Physical examination revealed him to have typical paralysis agitans. His height was $67\frac{1}{2}$ inches (171 cm.) and his weight 120 pounds (54 Kg.). The blood pressure was 148 systolic and 98 diastolic. The patient had a staring facies. The mouth was kept open and the tongue protruded most of the time. The eyeballs moved spastically. The teeth were extensively carious. The patient had a definite parkinsonian gait with noticeable shuffling of the feet on locomotion and dragging of the left leg. There was a severe tremor of the hands with voluntary movement. A roentgenogram of the skull was negative.

The various laboratory data are given in table 3; the results are not remarkable except that the blood cholesterol content was decreased and the basal metabolism increased to $+24$ and to $+36$ per cent before operation. Stramonium was given before all, except the first, metabolism tests to control the tremors.

On September 25 a total thyroidectomy was performed and one parathyroid gland was removed. The thyroid gland weighed 16.5 Gm. and was essentially normal, as was the parathyroid gland. The thyroid showed moderately large follicles with an appreciable amount of normally staining colloid. Epithelium lining follicles ranged from low cuboidal to flat. Vascularity was not extensive. The parathyroid gland microscopically showed the cords of alpha and beta cells arranged about small capillaries. The cells were uniform in size and were present in normal proportions. Occasionally small groups of acidophil cells were present.

For five days before the operation the intake of fluid ranged from 7,900 to 10,050 cc. and the urinary volume from 6,800 to 7,600 cc. Subsequently, the intake and output of fluid gradually decreased, so that within a month after the operation they were 3,400 cc. and 3,200 cc. respectively, as shown in chart 1. The specific gravity of the urine, which usually ranged from 1.000 to 1.002 before operation, increased to from usually 1.003 to 1.016 after operation. The various laboratory data after opera-

Chart 1 (case 2).—Effect of total thyroidectomy and of the subsequent intake of thyroid during two periods on the intake and output of fluid. One-tenth Gm. of thyroid was taken daily during the first period and 0.26 Gm. daily during the second.

tion, as given in table 3, showed a significant decrease in the basal metabolism, increase in the blood cholesterol and an appreciable increase in the patient's weight. Otherwise, there were no remarkable changes.

The daily intake and output of fluid continued to remain at a fairly constant volume of about 200 cc. to 300 cc. above or below the 3,000 cc. level, even though the patient had taken 0.015 Gm. of thyroid three times a week. On this regimen his basal metabolism remained at a level of approximately -20 per cent. However, in the past year he has been taking 0.06 Gm. of thyroid daily and his intake and output of fluid have been at slightly higher levels, about 3,700 to 3,800 cc., and the metabolic rate recently ranged from $+22$ to -4 per cent.

In general, the patient has felt and looked better and has had no nocturia. Thyroidectomy has had some beneficial effect on the Parkinson's disease, although he has continued to take the same dose of stramonium. The tremors have decreased so that he can take fluids without spilling them. He is able to walk a little better, and his mouth does not stay open as much as before the operation. The oculogyric crises have diminished considerably in duration and in number, although since he has been taking 0.06 Gm. of thyroid daily they have increased in number. His mentality is the same as it was before the operation. The patient says he is glad that he had the operation.

17. Blotner, Harry: Blood Fat Tolerance Tests in Malnutrition and Obesity, Arch. Int. Med. 55: 121 (Jan.) 1935.

This patient was readmitted to the hospital on three occasions after thyroidectomy for periods ranging from two to seven weeks for study of the effect of thyroid and of dinitrophenol on water balance. The details of these observations will be discussed with those of the next case. However, in brief, when thyroid was administered the polyuria and polydipsia returned but were not as excessive as before the operation.

CASE 3.—L. R., a man aged 29, single, entered the hospital for the first time on March 7, 1934 with complaints of polydipsia, polyuria and tremor of the left arm and leg for nine years. His illness began in 1924, when he began to be abnormally thirsty and passed an excessive amount of urine. At that time he was in the army and was discharged because of "weak kidneys." In 1926 he had fever and malaise and slept for three days. Subsequently, he was abnormally drowsy for six months. With the beginning of the drowsiness he began to notice trembling of his left arm and leg when at rest, and this became more severe, so that he had to shuffle his left leg when walking. For a year he had frequent supraorbital headaches. For years he had been taking $\frac{1}{100}$ grain (0.0006 Gm.) of scopolamine

Before thyroidectomy the daily intake of fluid usually ranged from 8,400 to 10,775 cc., although on rare occasions it was as low as 6,000 cc. The volume of urine usually varied from 6,525 cc. to 8,525 cc.

On October 30 a total thyroidectomy was performed and one parathyroid gland was removed. The postoperative course was gratifying, and the intake and output of fluid dropped rapidly, so that by November 19 these values were 3,660 cc. and 3,710 cc. respectively, with slightly higher and lower variations before this date, as shown in chart 2. The basal metabolic rate dropped to -23 per cent on November 19. The patient was more than pleased with his condition, and he volunteered the information that for the first time in years he was able to get a good night's sleep because the nocturia had disappeared. His tremors practically disappeared, and he looked better generally, but he continued to take about the same amount of scopolamine hydrobromide. He says that his mind has improved since the operation because he can concentrate and read better now.

The thyroid gland weighed 20 Gm. and showed some evidence of hyperactivity. On section, it showed a slight increase in fibrous tissue as represented by scattered trabeculae, deep gray

in color, but the intervening thyroid parenchyma was a pale tan with a deep red cast. Colloid was within normal limits. On microscopic examination, the thyroid showed most follicles of normal size with the usual amount of colloid. A few small follicles were present. Follicles occasionally showed high cuboidal epithelium, although most of the epithelium was low cuboidal, occasionally flat. Some of the follicles lined with high cuboidal epithelium contained little colloid. Rare follicles showed slight papillary projections. The stroma was scant. There was slightly more than the usual degree of vascularity.

The parathyroid gland appeared normal. Microscopically its closely packed cells were arranged in cords with little intervening fat or connective tissue. Most of the cells were of the clear type, but from place

Chart 2 (case 3).—Effect of total thyroidectomy and of the subsequent intake of thyroid on the intake and output of fluid. Thirty-nine hundredths Gm. of thyroid was taken daily for the first nine days and 0.52 Gm. for the last six days.

hydrobromide hypodermically three to four times daily for relief of the parkinsonism. The polyuria and polydipsia continued, and he urinated about fifteen times during the day and about ten times at night; the total volume of urine averaged about 9 liters a day. These symptoms were relieved with solution of posterior pituitary, which gave him headaches. The family and past histories were essentially negative.

Physical examination revealed nothing remarkable except the syndrome of paralysis agitans. There was a masklike expression of the face. The mouth was always open. There was a coarse, involuntary tremor of the left arm and the left leg which was constantly present when the arm and leg were at rest. The tremor disappeared with voluntary motion. The diagnosis was diabetes insipidus and postencephalitic paralysis agitans. Roentgenograms of the skull and pneumoencephalograms showed no signs of a tumor.

The patient was readmitted on Oct. 8, 1935 with the same history and symptoms as on the previous admission and was discharged on November 19. His height was 55 inches (165 cm.) and his weight 113 pounds (51 Kg.). The blood pressure was about 140 systolic and 80 diastolic. The various laboratory data before thyroidectomy are given in table 4 and appear within the normal range. Scopolamine hydrobromide was administered subcutaneously before the metabolism tests were done to control the tremors, and the results ranged from 0 to +19 per cent. No scopolamine hydrobromide was given before the first metabolism test, and the result was +68 per cent.

to place acidophil cells were scattered among them. The gland was well vascularized.

The various laboratory tests were repeated many times after operation, but the data collected on several occasions are also given in table 4. They show how the metabolism has decreased and how the cholesterol content of the blood has increased. The patient has myxedema but feels comfortable and does not take thyroid. His weight has increased from 113 pounds before operation to 198 pounds (90 Kg.) in April 1940. His basal metabolic rate on many occasions was -23 per cent. Roentgenograms of the heart taken in April 1940 showed it to be just above the limits of normal with prominence of the left ventricle. Fluoroscopic examination showed a regular beat of fair quality, not the usual poor beat of myxedema.

This patient was readmitted to the hospital on five occasions after thyroidectomy for periods ranging from four to nine weeks for study of the effect of thyroid, dinitrophenol and solution of posterior pituitary on his water balance. Briefly, the administration of thyroid alone increased the intake and output of fluid, as it did in the previous case. The details of these observations will be discussed with those of the second case.

EFFECT OF THYROID ON WATER BALANCE

In order to study the effect of the administration of thyroid on the water balance of these patients after

total thyroidectomy, patients 2 and 3 were readmitted to the hospital each on two occasions for lengthy periods. In these studies they were observed during a control period when no solution of posterior pituitary or dinitrophenol was administered for a long time and when we felt certain that their metabolism was at a basal level. Then thyroid was taken orally for a number of days, and the change in the intake and output of fluid and in the basal metabolism was noted during this period and again after the omission of thyroid. On the charts only a few days of the control periods before and after medication are recorded, and they represent many days of observation.

The results of the observations on the effect of thyroid on the water balance and on the metabolism in these 2 cases are illustrated also in charts 1, 2 and 3. Shortly after thyroid was administered, the intake of fluid and output of urine increased greatly, and these were usually maintained at a higher level during the latter part of the period of thyroid therapy. The polyuria and the polydipsia, however, appeared before the basal metabolism became elevated. After thyroid was omitted the polyuria and polydipsia persisted for an appreciable period of time, even though the basal metabolism had decreased to a low level. This indicates that there is a prolonged effect of this drug on the elimination of water, since the intake and output of fluid returned to their original levels within two weeks to several months after the withdrawal of thyroid.

DINITROPHENOL AND THYROID AND WATER BALANCE

It was then decided to determine, if possible, whether the stimulating effect of thyroid on the excretion of water is due to an increased basal metabolism or whether it is due to some specific mechanism. In these studies, patients 2 and 3 were observed during a preliminary control period. Then dinitrophenol was given orally for a period of time until the metabolism was elevated. The drug was omitted, and subsequently the metabolism dropped rapidly to its low level. Thyroid was then given orally, and a comparison was made of the intake and output of fluid during these periods. The whole period of observation in the hospital for this study was two months in each case.

The comparative results of the effect of these drugs are shown in charts 4 and 5. The administration of dinitrophenol did not appear to produce any great change in the water balance even though there was a prompt and great increase in the metabolic rate. The subsequent intake of thyroid did not produce as great an increase in the intake and output of fluid as it did when it was given without dinitrophenol having been given previously. The comparative results with dinitrophenol and thyroid suggest that the diuretic action is

not explained by an increased metabolic rate but is probably due to some specific mechanism.

Patient 3 was also in the hospital for six weeks beginning June 9, 1936, during which time he was given 0.5 cc. of solution of posterior pituitary subcutaneously three times a day, which resulted in a decreased intake and output of fluid. Immediately after the omission of the solution, he was given thyroid for a week, which resulted in an increase in his metabolism from -25 to $+22$ per cent. It was interesting that at this time thyroid did not alter significantly his urinary output even though the metabolism was greatly increased.

The effect of thyroid in these 2 cases when it was given shortly after dinitrophenol or solution of posterior pituitary had been omitted appeared to be appreciably less than when thyroid was taken when there was an interval of months between the administration of the drugs. In all instances, the ingestion of thyroid increased the symptoms of paralysis agitans.

Chart 3 (case 3).—Effect of the intake of thyroid on the intake and output of fluid, and persistence of polyuria and polydipsia for several months after the drug was omitted. Thyroidectomy was done Oct. 24, 1935.

COMMENT

Since these patients had total thyroidectomies performed in 1935 there have appeared four reports in the literature in which patients with diabetes insipidus have had either a total or a subtotal thyroidectomy. McConnell¹⁸ reported a case in which diabetes insipidus and thyrotoxicosis, associated with a thyroid adenoma and a metabolism of $+10$ per cent, were present at the same time. Removal of the adenoma of the thyroid gland resulted in immediate relief of the symptoms of diabetes insipidus and a basal metabolism of -20 per cent. McPhedran¹⁹ reported a case of diabetes insipidus associated with toxic goiter in which diabetes insipidus was not improved after subtotal thyroidectomy. The microscopic appearance of sections of the thyroid gland were characteristic of a hyperplastic goiter with colloidal accumulation. Ferro-Luzzi²⁰ and Findley²¹ each

21. Findley, Thomas, Jr.: Thyroid-Pituitary Relationship in Diabetes Insipidus, *Ann. Int. Med.* 11: 701 (Nov.) 1937.

reported a case of diabetes insipidus in which total thyroidectomy had no appreciable effect on the polydipsia and polyuria of the disease. There was no guaranty that all the thyroid tissue was removed. However, it was interesting that both of their patients had syphilis, which may have been a factor in their results.

The results in our 3 cases have shown that total thyroidectomy relieved the diabetes insipidus in 2 of 3

dence. In Findley's case²¹ the thyroid gland was described as in an extreme resting phase which might be correlated with a decreased metabolism and was similar to the thyroids from hypophysectomized animals.

Tests were made in addition to show that the removal of the thyroid gland has an effect on the anterior lobe of the pituitary gland. These were done by determining the amount of the thyrotropic hormone in the blood and urine in case 3 seven months after thyroidectomy. Positive evidence of the excretion of thyrotropic hormone was found and, according to Hertz and Oastler, none is obtained normally.

When thyroid was administered to the patients some months after thyroidectomy the polyuria and the polydipsia were reestablished, but these were not as severe or as sustained as before the operation. Thyroid had a much greater effect on the water balance when the basal metabolism was at a low level for many months and not when immediately preceded by the administration of dinitrophenol or solution of posterior pituitary, after which thyroid had practically no significant diuretic response.

We suggest that there is a disturbance in the thyroid-pituitary relationship in diabetes insipidus which may play a part in the clinical aspects of the disease. Our observations have revealed that there is a definite relationship between thyroid activity and water balance. This may be specific and in the nature of an active diuretic principle and not due only to the ability of the thyroid gland to raise the basal metabolism as judged by the comparative responses of the intake and output of fluid to dinitrophenol and to thyroid in our cases. Furthermore, thyroid increased the intake and output before the metabolism became elevated; also they remained at an elevated level for some time after thyroid was omitted, even though the metabolism had decreased to its original low level.

It appears that in the normal person there is a normal balance between the secretions of the anterior and

Chart 4 (case 2).—Comparative effects of dinitrophenol and subsequently of thyroid on the intake and output of fluid one and one-half years after total thyroidectomy. Two-tenths Gm. of dinitrophenol was given daily for the first four days, then 0.3 Gm. daily. Thyroid was given daily in doses of 0.13 Gm. for four days, 0.2 Gm. for three days and 0.4 Gm. for five days.

patients with this disease. In the first case of diabetes insipidus total thyroidectomy had no effect on the disease. However, in this case we believe that the patient has accessory thyroid tissue present because her metabolism and blood cholesterol level are much the same now as before the operation. In addition, she has shown no symptoms or signs of myxedema, even though she has taken no thyroid since the thyroidectomy. Blotner and Perkin²² have studied the iodine metabolism in patients with diabetes insipidus and found an abnormal form of iodine metabolism with high and low levels of iodine in the blood and increased excretion of iodine in the urine. Furthermore, studies²² on iodine in the blood and urine of this patient showed it to be the same as for the patients with diabetes insipidus who have their thyroid glands.

Total thyroidectomy relieved the polyuria and polydipsia in the last 2 cases of diabetes insipidus, of postencephalitic origin, and also improved appreciably the Parkinson's disease. In these 2 cases, one parathyroid gland was also removed; whether the removal of one parathyroid gland in addition to the thyroid gland is a factor in the relief of the diabetes insipidus is questionable. The studies on iodine²² in these 2 patients indicated that no thyroid tissue was present.

The pathologic condition of the thyroid gland in 2 of the cases indicated evidence of hyperactivity of this gland. Previously, the thyroid gland in diabetes insipidus had not been described as abnormal. However, in McConnell's¹⁸ and McPhedran's cases¹⁹ the abnormal thyroid glands were described as a coinci-

Chart 5 (case 3).—Relative effect of dinitrophenol and subsequently of thyroid on the intake and output of fluid more than two years after total thyroidectomy. One-tenth Gm. of dinitrophenol was given daily for the first five days and then 0.3 Gm. daily. Thyroid was given daily in doses of 0.2 Gm. for nine days, 0.3 Gm. for four days and 0.5 Gm. for seven days.

posterior lobes of the pituitary gland. In diabetes insipidus there appears to be a decreased secretion of the posterior lobe and an excess secretion of the anterior lobe. The hyperactivity of the thyroid gland may be due to stimulation resulting from increased activity of the anterior lobe of the pituitary and suggests the possibility that the diuretic effect of the anterior lobe of the pituitary gland is through its regulation of the thyroid. This is suggested also by

22. Blotner, Harry, and Perkin, H. J.: Blood and Urine Iodine in Patients with Diabetes Insipidus, lecture delivered at Peter Bent Brigham Hospital, March 5, 1940.

the animal experiments in which diuresis produced by the injection of solutions of the anterior lobe of the pituitary gland is abolished by thyroidectomy. These ideas do not interfere with the work of Ranson and his associates,²³ who showed how the supraoptic hypophyseal tract controls the secretion of the hormone of the posterior lobe.

The evidence in our studies justifies the application of thyroidectomy in patients with diabetes insipidus associated with postencephalitic Parkinson's disease.

SUMMARY

Total thyroidectomy was done on 3 patients with diabetes insipidus who have been observed for five years since the operation. The patients studied had acquired the disease many years previous to our investigations and consisted of 1 elderly woman whose diabetes insipidus was idiopathic and 2 young men whose disease was associated with postencephalitic Parkinson's disease. Total thyroidectomy relieved the diabetes insipidus in the 2 cases of postencephalitic origin and also improved the Parkinson's disease. Total thyroidectomy had no effect on the diabetes insipidus of the first patient, whose disease was idiopathic. However, we believe that this patient has accessory thyroid tissue because of her normal basal metabolism, the lack of symptoms and signs of myxedema and because of the levels of cholesterol and iodine in her blood.

The administration of thyroid, when not recently preceded by dinitrophenol, reestablished the polyuria and polydipsia, but these were not as severe or as persistent as they had been before total thyroidectomy. The diuretic effect of thyroid appears somewhat spe-

cific, in the nature of a diuretic principle, and is not due particularly to its ability to raise the basal metabolism. This was suggested by the occurrence of an increased intake and output of fluid while the metabolism was still low after thyroid medication and by the comparative response of the water exchange to dinitrophenol and to thyroid.

Studies of the thyroid gland in 2 cases indicate some hyperactivity of this gland. It is suggested that the thyroid gland plays a part in the clinical aspects of diabetes insipidus.

The evidence in our studies justifies the application of total thyroidectomy in cases of diabetes insipidus associated with postencephalitic Parkinson's disease.

ROENTGENOGRAPHIC DIAGNOSIS OF
CONGENITAL SYPHILIS

IN UNERUPTED PERMANENT TEETH

BERNARD G. SARNAT, M.D.
ISAAC SCHOUR, D.D.S., PH.D.
AND
ROBERT HEUPEL, D.D.S.
CHICAGO

This report demonstrates the value of routine intra-oral roentgenograms of unerupted permanent teeth as an aid in the early diagnosis of congenital syphilis.

The growing teeth, like the bones and other organs, may be affected in congenital syphilis. Hutchinson¹ described the screwdriver-shaped and notched permanent upper central incisors as the most common and characteristic clinical dental abnormality. A roentgenographic diagnosis of unerupted Hutchinson incisors was

Fig. 1.—(a) Deciduous central (A) and lateral (B) incisors. Unerrupted permanent central (1) incisor. Note the convergence of the proximal surfaces at about the midcoronal level. The incisal third is irregular in density. The upper lateral incisors (2) are not affected. ab, alveolar bone. (b) The central incisors have erupted. The coronal portion is similar to that in figure 1 a. The roots are now nearly completely formed and calcified. (c) Note the normal contour of the crowns and divergence of the proximal surfaces. Compare figure 1 a and b.

made first by Stokes and Gardner² in a patient aged 5 years and subsequently by Meyer-Buley³ in a patient aged 2 years. Quinlan⁴ and others⁵ have reported similar diagnoses. While Moon⁶ described a characteristic clinical appearance in the permanent first molars, roentgenograms of these teeth prior to eruption have been reported by Pincherle.^{6a}

REPORT OF CASE

History.—J. W., a Negro girl, born Jan. 8, 1934, apparently had bronchopneumonia during infancy and possibly rickets. A

diagnosis of congenital syphilis was made March 27, 1936. Roentgenograms of the long bones were of no diagnostic aid. Treatment had consisted of acetarsone alternated with bismuth salicylate. Interstitial keratitis or deafness due to a lesion of the auditory nerve was not found.

Dental Condition.—Intraoral examination in 1938 revealed the presence of all the deciduous teeth with the exception of the lower incisors. The coronal portion of the upper incisors was worn to the gingival level. Aplasia of the enamel of the cuspid

Fig. 2.—(a and b) The changes in the central (1) and lateral (2) incisors are similar to those in the upper permanent central incisors in figure 1 a and b. Note the similar convergence of proximal surfaces of crowns in unerupted (a) and erupted (b) teeth and the progress of the formation of roots. (c) Note the normal contour of the crowns and divergence of the proximal surfaces. Compare with figure 2 a and b.

and molar teeth had occurred during the neonatal period and earliest infancy. No permanent teeth were present in the oral cavity.

Upper Anterior Teeth: Examination of the roentgenograms (fig. 1 a) confirmed the clinical observations and in addition showed a screwdriver appearance of the crowns of the unerupted permanent central incisors. The proximal surfaces began to converge at about the midcoronal level. In addition, the incisal third was irregular in density. The cuspids were also affected. The lateral incisors were normal.

In July 1940 clinical examination revealed a typical screwdriver appearance of the crown. The incisal third was pitted and narrower than normal in the mesial and distal diameters. The roentgenograms at this time were similar to those of 1938 except that dental formation, calcification and eruption had progressed (fig. 1 b). The coronal portions of the teeth remained unchanged and showed a distinct convergence, in contrast to

Permanent First Molars: Roentgenograms of all of the unerupted permanent first molars in 1938 showed a convergence of the proximal surfaces toward the occlusal, so that the mesiodistal diameter was less than normal. The occlusal surface was irregular (fig. 3 a).

Clinical examination of the same teeth in 1940 showed a constriction of the occlusal surface. The cusps were worn, flat and close together. Roentgenograms taken at this time were similar to those taken in 1938 but showed the growth, calcification, eruption and attrition that had since occurred (fig. 3 b). A comparison of the normal permanent second molar with the affected permanent first molar showed distinct differences in the contour and size of the crown (fig. 3 b).

The roentgenographic diagnosis of congenital syphilis on the basis of the abnormalities of the permanent incisors and molars made in 1938 was thus confirmed by clinical examination in 1940.

Since these changes occurred in early infancy, they are manifestations of early and not of late congenital syphilis, as has been commonly believed.

COMMENT

The presence of Hutchinson incisors does not necessarily mean that the permanent first molars need be affected. In previous roentgenographic reports, except one by Pincherle,^{7a} apparently only the upper permanent central incisors were affected.

The Hutchinson incisor owes its characteristic shape to a disturbance which occurs early in dental develop-

Fig. 4.—Diagrammatic representation of the gross morphologic characteristics observed in the teeth of the patient with congenital syphilis, compared with a normal control.

ment in congenital syphilis.⁷ This is at the period of morphodifferentiation when the pattern of the dentino-enamel junction (and the future crown of the tooth) is being established. The apposition of enamel which occurs later follows the pattern of the dentino-enamel junction and proceeds normally. Clinically the enamel surface is smooth.⁷

The affected teeth of the patient described show alterations in two different phases of dental development, depending on the developmental stage which obtained at the time of the disturbance. The first is one of disturbed differentiation, in which the basic morphologic pattern of the tooth is affected, giving a convergence of the proximal surfaces of the permanent incisors and molars. Only these teeth are affected in the manner described because they are in the stage of morphodifferentiation at the neonatal period and in earliest infancy, when congenital syphilis is probably most active. Thus the permanent upper lateral incisors are normal because their development occurs at a later period (ten to twelve months).

E.: Hutchinson's Tooth: Dental Reduction (Aplasia of Medial Edge Tubercle) from Viewpoint of Normal and Pathologic Anatomy, Nederl. tijdschr. v. geneesk. 76:2208 (May 7) 1932. Sarnat, B. G., and Shaw, N. G.: Dental Findings in Congenital Syphilis, to be published.

Fig. 3.—(a) The erupted deciduous first (IV) and second (V) molars show aplasia of the enamel such as occurs in the neonatal period and in earliest infancy. Note the occlusal convergence of the proximal surfaces and the irregular occlusal region in the unerupted permanent first molar (6). (b) Note the erupted permanent first molar, which differs from figure 3 a in that the cusps have been abraded and the occlusal surface is relatively flat. Compare with normal unerupted permanent second molar (7) as to size and contour.

the characteristic normal divergence of the proximal surfaces toward the incisal edge (figs. 1 c and 4).

Lower Anterior Teeth: The roentgenographic and clinical appearance of the permanent central and lateral incisors was similar to that of the upper permanent central incisors and also differed distinctly from the normal (fig. 2 a, b, c). In the cuspids a small portion of the incisal edge was affected.

The second stage is one of hypoplasia or disturbed apposition in the enamel of the deciduous teeth. These teeth are still active in the formation of enamel and reflect the disturbance in this structure. They do not show disturbed morphodifferentiation because this stage is completed before the neonatal period.

The changes in the teeth are permanent⁸ while those in bone are subject to resorption. Recently, however, the interpretation of the condition of bone in cases of early congenital syphilis has been questioned.⁹ It is interesting that roentgenograms taken of the long bones when the patient was 2 years old were of no diagnostic value. Had intraoral roentgenograms been taken the diagnosis of congenital syphilis could have been confirmed by the dental abnormalities.

After the disturbed neonatal period and earliest infancy another metabolic upset occurred (about three to ten months), as evidenced by the pitted type of hypoplasia of the enamel (chronologic aplasia of the enamel) on the permanent teeth.¹⁰ This is not a frequent condition in congenital syphilis and was probably due in this instance to the bronchopneumonia during infancy or to infantile rickets.

SUMMARY

1. An early roentgenographic diagnosis of congenital syphilis on the unerupted permanent central incisors and first molars of a Negro girl aged 4 years was made and confirmed clinically two years later when the teeth had appeared in the oral cavity.

2. The teeth showed disturbances in the developmental phases which occur during the neonatal period and earliest infancy. The effects were different in the growing deciduous and permanent teeth, depending on the developmental stage active at the time. The deciduous teeth, active in the formation of enamel, showed hypoplasia; the permanent teeth, active in morphodifferentiation, showed a disturbed dentino-enamel junction with a resulting characteristic distortion of the crown.

3. In addition, the presence of hypoplasia of the enamel, in the permanent teeth was probably the record of another systemic disturbance which had been present from about the third to the tenth month.

4. The conditions of the teeth are permanent and not subject to change as they are in the bones.

5. Roentgenograms of the unerupted permanent teeth as well as of the long bones should be used as an aid in the early diagnosis of congenital syphilis.

Beginning of Modern Chemistry.—Modern chemistry begins with Lavoisier (1743-1794). His was the honor of overthrowing the incubus of the phlogiston theory and establishing the modern theory of combustion; of placing chemical experiments on a quantitative basis and so of securing the acceptance of the law of conservation of mass; of founding the modern system of nomenclature by which the composition of a substance may be recognized from its name; and of gaining the widespread acceptance of Boyle's definition of an element. Any one of these contributions would have insured his fame.—Timm, John A., in Development of the Sciences, New Haven, Conn., Yale University Press, 1941.

ARTIFICIAL INSEMINATION

PRESENT STATUS IN THE UNITED STATES
AS SHOWN BY A RECENT SURVEY

FRANCES I. SEYMOUR, M.D.

AND

ALFRED KOERNER, M.D.

NEW YORK

On the completion of the recent survey of the status of artificial insemination in the United States sponsored by the National Research Foundation for Eugenic Alleviation of Sterility, Inc., the following facts were disclosed.

Thirty thousand physicians in this country were circularized. They were chosen because of the nature of their work and their association with a type of practice in which occasion to use artificial insemination might arise. Seven thousand, six hundred and forty-two replies were received. These bore witness to the fact that 9,489 women had achieved at least one pregnancy by this method. Almost two thirds of all the successful pregnancies were effected through the use of the husband's semen alone; of these, 3,569 resulted in boys, while 2,271 resulted in girls. Donors were used successfully in 3,649 pregnancies, of which 2,107

124	21+

resulted in boys and 1,542 in girls. Figure 1 depicts this situation graphically.

More than 97 per cent of all the pregnancies resulting from artificial insemination terminated in living, normal babies. The remainder included 217 miscarriages and abortions, this incidence being only one fifth or less than that among so-called normal women in whom pregnancies result without aid. There were 22 extrauterine pregnancies in the series, which is only one sixth that of the number which would be expected in an average series of pregnancies. In every case the living children were normal in every respect and by every criterion.

Artificial insemination was employed so successfully that in 1,357 patients more than one pregnancy was effected by this means. The grand total of children sired by the method and here reported is nearly 9,500. The greatest success (45 per cent of pregnancies) occurred in those cases in which twelve inseminations were used. The 4,049 physicians reporting the 9,489 pregnancies required inseminations varying in number from one to seventy-two, as shown in the accompanying table.

In 40 per cent of all inseminations some solution was reported added to the specimen. Frequently operations are employed to cure sterility and make impregnation possible. Nearly four hundred surgical operations

were prevented by the use of artificial insemination (fig. 2). This means that there were nearly twenty-five times as many pregnancies as the total number of cases in which operation had to be considered. More than seventeen times as many operations were avoided as the total number of extrauterine pregnancies occurring in the series, while the relationship to the number of stillbirths was even more striking (32 to 1).

Two thousand, four hundred and seventy-eight physicians never had occasion to use artificial insemination, while 1,115 failed to obtain any pregnancy (fig. 3). When one considers that in a normal couple with normal marital relationships a pregnancy is often not induced until fifteen months have elapsed, it is easily understood why 1,115 reported failure. To be successful in artificial insemination, perseverance must be exercised by both patient and operator.

Of the 1,115 who failed to obtain a pregnancy by artificial insemination, 50 gave no specific number of inseminations used. The other 1,065 physicians answered as follows: Seven hundred and forty tried one insemination, 111 tried two, 91 tried three, 83 tried four, 7 tried five and 33 tried six inseminations.

Throughout the literature there have been many reports of failure and skepticism as to the value of artificial insemination. A careful analysis of these articles, however, will reveal the reasons for failure. Just such a report appeared in a leading medical

includes, among other things, the establishment of tubal patency, ascertaining the normality of the female endocrine system and procuring satisfactory seminal specimens from an acceptable source. It is doubtless the physician's responsibility to see to it that the full benefit of modern medical knowledge is given to the patient.

Fig. 1.—Viable pregnancies initiated by the use of artificial insemination; ♂ indicates boys and ♀ girls.

Fig. 2.—Complications with artificial insemination as compared with a normal series of pregnancies. Solid black represents three hundred and eighty-two operations which were made unnecessary by the use of artificial insemination to effect pregnancy; diagonal stripe section represents twenty-two extrauterine pregnancies reported in the series, which are one hundred and ten less than in a normal series of similar number. The dotted field represents two hundred and seventeen miscarriages, or 2.3 per cent reported, whereas in a similar number of normal pregnancies the incidence is as great as 10 to 20 per cent.

The case report continued by stating that the patient was "uncooperative." Cooperation and absolute confidence between physician and patient are required at all times to insure success. "The specimen was sent by messenger without date . . ." To be certain of delivery of authentic specimens from either husband or donor, messengers, when used at all, are chosen most carefully. Arrangements included "selection of the donor by the family." For obvious reasons no choice of donor by the family is permitted. The physician alone has this responsibility as well as that which goes with the whole case.

A fair appraisal of artificial insemination can be obtained only after careful and controlled work. As has been pointed out, many normal newly wed couples do not effect pregnancy until many months of married life have elapsed. Therefore 100 per cent success is not expected from any method, not even from artificial insemination, especially when one's efforts are abandoned after from one to six attempts at insemination.

Because of the lack of absolute knowledge of the time of ovulation in the human being, no case should be considered hopeless until an adequate period of trial has elapsed. A three year period with an average of three inseminations a month should be established, since that would be twice as long as is allowed for unaided pregnancy before the couple is considered sterile. If such cases had not been persisted in, pregnancy would never have ensued, and failure would have been attributed to artificial insemination. Such, in fact, was the case with each of the 1,115 failures reported in this survey.

Only a handful of "flare-ups" resulted through the use of uterosalpingography (less than 0.5 per cent of pregnancies). This is a point that should be par-

journal this year. One should consider the reasons for the author's large percentage of failures out of a total of 35 reported cases. The report stated that "preliminary study was inadequate." Unless a case is thoroughly worked up, success from artificial insemination cannot be expected. Adequate preliminary study

ticularly emphasized. Of these, in only 9 was operative intervention required. In the past, certain observers in the literature on sterility have felt themselves forced to write with trepidation of their experiences with uterosalpingography. Now there is no longer any need for such a pessimistic point of view provided the operator chooses his cases with care and employs an accepted technic.

Figure 4 shows the distribution of children who have been sired by artificial insemination. The Central and Atlantic Seaboard sections of the country preponderate in this respect. It is evident that certain sections of the country have been more alert in accepting the usefulness of and employing this new addition to the medical armamentarium. It is to be hoped that the results of this survey will win new friends for this procedure whenever and wherever the need for its use may arise.

SUMMARY

Of nearly ten thousand pregnancies that were obtained through artificial insemination, two thirds were effected through utilization of the husband's semen alone.

The proportion of boys to girls resulting was roughly 8 to 5 when the husband's semen was used and 7 to 5 when a donor's was used.

Fig. 3.—Number of pregnancies initiated with regard to number of inseminations made. Fine black line indicates 9,489 reported pregnancies by artificial insemination, and heavy black line represents 1,115 patients who reported failure with artificial insemination.

Ninety-seven per cent of pregnancies initiated by artificial insemination resulted in live babies.

The incidence of miscarriages and abortions was only one fifth that occurring normally in the population taken

as a whole in areas where artificial insemination is not practiced.

The incidence of extrauterine pregnancies was only one sixth that occurring normally.

The occurrence of stillbirths was practically negligible.

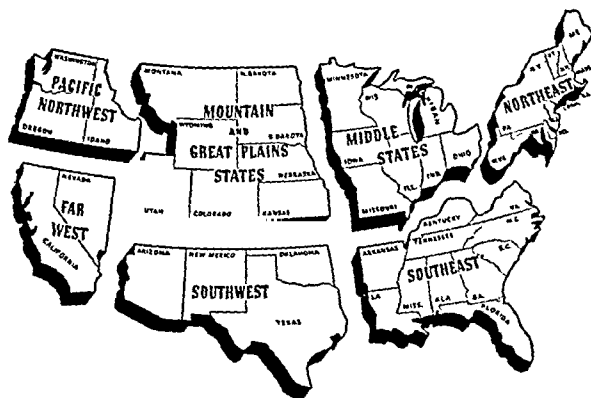

Fig. 4.—Geographic distribution of 9,238 children conceived by artificial insemination: Northeast, 4,260; Southeast, 1,663; Middle states, 2,403; Southwest, 58; Mountain and Great Plains states, 141; Far West, 617, and Pacific Northwest, 96.

“Flare-ups” from uterosalpingography were few and were mostly of a transitory nature.

All living children were born normal in every respect.

One thousand, three hundred and fifty-seven women had repeated pregnancies by artificial insemination.

Nearly ten thousand children were brought into the world by the aid of this procedure.

Forty-five per cent of all pregnancies occurred in cases in which twelve inseminations were employed.

Nearly four hundred surgical operations were prevented because of the use of artificial insemination.

The principal causes of failure can be removed if inadequate preliminary study of the case, lack of cooperation of the patient, unreliable messengers, the use of imperfect seminal specimens and the lack of perseverance on the part of the physician in his attempts at insemination are eradicated.

Successful pregnancies were reported with inseminations varying in number from one to seventy-two.

The Central and Atlantic Seaboard sections have the greatest number of children sired by artificial insemination as well as the largest success with this procedure.

53 East Ninety-Sixth Street.

Protection Against Hemorrhagic Disease.—Vitamin K is the name of a group of substances which protect man and the higher animals against a well characterized hemorrhagic disease. The most important members of this group are vitamin K₁, from green leaves, and vitamin K₂, which is formed by bacteria. Both substances are lipoids. . . . In the vegetable kingdom vitamin K is principally found in all kinds of green leaves. This source contains several hundred units per gram dry weight. Fruits are rather poor sources—an exception is tomatoes. . . . Treatment with vitamin K is now used in all cases where patients with obstructive jaundice are operated, and the risk of bleeding as a consequence of the surgical operation is thereby completely eliminated.—Dam, Henrik: Factors in Preventing the Blood from Leaving the Vascular System, *Quart. Bull. Indiana Univ. Med. Center*, April 1941.

TETANUS FOLLOWING INDUCED
ABORTIONW. L. BUSH, M.D.
SAN ANGELO, TEXAS

Tetanus following induced abortion appears to be a rare condition, or at least if it is common it has not been reported. In 1931 Mattson and Starkey¹ reported 1 case, with recovery. Komaromy² reported 1 case in 1937 and stated that there were numerous cases reported in the literature. In the German literature, Schneider was able to find records of 111 cases, with a mortality of 91 per cent. Komaromy brought out the fact that it is essential to determine whether the inoculation with tetanus took place through other wounds in the skin and was merely coincidental with the abortion. As a result of a survey of the literature, I think it is justifiable to report 5 cases, with a mortality of 100 per cent.

The 5 patients admitted having been pregnant and having sought an abortion and alleged that the abortion was done by the same person in all cases.

REPORT OF CASES

CASE 1.—History.—A white woman aged 22 was admitted on Aug. 11, 1940 complaining of stiffness of the neck and jaws. She gave a history of having not menstruated for three months and of consulting a physician requesting an abortion. She stated that a pack was placed in the uterus and that on the following day she began to bleed and had a severe chill. Four days afterward, she was unable to open her jaws and her neck became stiff. She gave no history of injuries such as punctured wounds or foreign bodies in the skin for the month preceding this illness.

Physical examination on admission revealed the temperature to be 98.6 F., the pulse rate 72 and the respiratory rate 16. The physical examination revealed nothing abnormal except inability to open the jaws over $\frac{1}{2}$ inch (1.2 cm.), hyperactive knee jerks and tenderness over the region of the bladder. The red blood cell count was 4,600,000. The hemoglobin content was 90 per cent. The white blood cell count was 8,000, with 1 per cent eosinophils, no basophils, 13 per cent stab cells, 58 per cent segmented cells, 24 per cent lymphocytes and 4 per cent monocytes. The urine was normal. The Kahn, Kolmer and Hinton reactions were negative. Examination of the spinal fluid was not done.

Course.—The temperature, pulse rate and respiratory rate began to increase on the second day after admission, and convulsions began and increased in number and severity; she died on the fifth day after admission. Edema of the lungs was apparently a terminal complication.

Treatment.—The patient received a total of 180,000 units of tetanus antitoxin in doses of 20,000 units given intravenously twice daily. She also received avertin with amylene hydrate rectally for sedation, 50 per cent magnesium sulfate intramuscularly and 1,000 cc. of 5 per cent dextrose in saline solution intravenously every eight hours.

CASE 2.—History.—A white woman aged 22 was admitted on Aug. 12, 1940 complaining of flooding and cramping in the lower part of the abdomen. She was about six weeks pregnant when she consulted a physician, requesting that an abortion be done, and a pack was placed in her cervix. This was done about six days before her admission to the hospital. She bled a moderate amount for the first four days and then began to bleed profusely and passed large clots. For eighteen hours before admission she had noted pains in her neck and jaws.

The rest of the history was irrelevant except for the fact that she had not suffered a punctured wound or other injuries for the preceding thirty days.

Physical Examination.—The temperature on admission was 99.6 F., the pulse rate 90 and the respiratory rate 20. Physical examination showed her to be normal except for rigidity of the muscles of the neck and jaw, exaggeration of the knee jerks, an enlarged, tender uterus, and a foul-smelling bloody vaginal discharge. The patient was unable to open her mouth more than $\frac{1}{4}$ inch (0.6 cm.).

The white blood cell count was 10,000, with no eosinophils, 1 per cent myelocytes, 3 per cent juvenile cells, 44 per cent stab cells, 40 per cent segmented cells, 9 per cent lymphocytes and 3 per cent monocytes. The urine was normal. The spinal fluid was clear and colorless, the cell count was 1 and the globulin and Kolmer reactions were negative.

Course.—The patient began to complain of severe pain in the neck and jaws soon after admission, and on the following morning she was stuporous. No convulsions occurred until eighteen hours after admission. The temperature ranged from 100 to 101 F., and the pulse rate ranged around 120. On the following day, her condition remained unchanged except that the temperature was 102 F. most of the day and she was unconscious throughout the day. The respiration was normal and the chest clear. She had several convulsions during the day, and suddenly about 2:15 the following morning she died. The cause of death could not be determined but was attributed to cardiovascular collapse or respiratory paralysis.

Treatment.—The patient received 180,000 units of tetanus antitoxin intravenously in doses of 20,000 units every twelve hours and one dose of 20,000 units intramuscularly on admission. Sodium amytal was given in doses of 6 grains (0.4 Gm.) every four hours by rectum for the first twenty-four hours, and then avertin with amylene hydrate was given by rectum every four to six hours for sedation. She also received $\frac{1}{4}$ grain (0.016 Gm.) of morphine sulfate for restlessness and 10 cc. of a 10 per cent solution of magnesium sulfate intravenously twice a day. She received 1,000 cc. of 5 per cent dextrose in saline solution every eight hours intravenously.

CASE 3.—History.—A white woman aged 33 was admitted Aug. 22, 1940 complaining of stiffness and soreness in the jaws. The patient had passed her menstrual period only a few days when she consulted a physician, who placed a pack in the neck of the uterus. This had been done seven days prior to admission to the hospital. Her first symptoms were noticed on the day before admission. A history of any other wound or injury during the past three weeks could not be elicited.

Physical examination revealed the usual symptoms of tetanus, namely stiffness of the jaws, rigidity of the muscles of the neck, slight spasticity of the abdominal muscles and exaggeration of the knee jerks.

There were 9,500 white blood cells, with 1 per cent juvenile cells, 25 per cent stab cells, 59 per cent segmented cells and 15 per cent lymphocytes. The spinal fluid was not examined.

Course and Treatment.—The patient was handled somewhat differently from the other patients in this series. First, 60,000 units of tetanus antitoxin was given by vein and a moderately large dose of avertin with amylene hydrate was given by rectum. Then the patient was taken to the operating room, and a supravaginal hysterectomy was done, particular attention being given to preventing contamination of the peritoneum. The operative record stated that the uterus was slightly larger than normal and was in second degree retroversion. There was no induration of the tissue. The uterus and adnexa showed a slight degree of hyperemia. The pathologist reporting on the examination of the uterus stated that sections from it showed the endometrium to be fairly normal, not greatly congested, and the glandular structure normal. He stated that he could see nothing abnormal in this tissue and that he did not receive the impression that this had been a gravid uterus. The patient had a fairly normal twenty-four hours after the operation. During the day, she received 1,500 units of tetanus antitoxin, and this amount was given daily intramuscularly. On the day after operation, she also received 450 cc. of citrated blood and

The cases reported were taken from the gynecologic service of the Shannon West Texas Memorial Hospital.

1. Mattson, C. H., and Starkey, T. A.: Tetanus Following Induced Abortion, *Minnesota Med.* 14:737 (Aug.) 1931.

2. Komaromy, G. G.: Tetanus Associated with Criminal Abortion, *Am. J. Obst. & Gynec.* 34:687 (Oct.) 1937.

60 grains (4 Gm.) of sulfanilamide intravenously. Hypertonic magnesium sulfate solution was given intramuscularly every six hours. Morphine sulfate and avertin with amylene hydrate were given to control convulsions but were unsuccessful. The patient was given 500 cc. of a 20 per cent solution of dextrose in water intravenously every eight hours and was also given nasal feedings of egg albumin, milk and whisky. She received also three more transfusions of 300 cc. of citrated blood, and one dose of 30 grains (2 Gm.) of sulfathiazole was given by duodenal tube during the twenty-four hours. In all, the patient received 66,000 units of tetanus antitoxin. She died on the third day after admission and apparently ran the same type of course as the other patients in this series.

CASE 4.—History.—A white woman aged 20 was admitted on Aug. 23, 1940 complaining of severe pain in the head and neck. Six days before admission the patient had consulted a physician who placed a pack of gauze in the neck of the uterus. At this time, she thought that she was about two months pregnant. Since this packing, she had been passing clots of blood and had experienced cramping in the lower part of the abdomen. On the evening before admission, she noticed that her jaws were stiff but that there was no particular pain in them. The gauze pack was passed with numerous clots of blood shortly before admission. There was no history of any other injury or break in the skin for the month preceding the present illness.

Physical examination revealed the temperature to be 99 F., the pulse rate 102 and the respiratory rate 20. The mouth was tightly closed, and conversation was limited to movements of the lips. The jaws could not be opened more than $\frac{1}{4}$ inch (0.6 cm.). The muscles of the neck were quite rigid and the head was held in opisthotonos. Rigidity of the abdomen was not noted, but there was a reflex spasm of the neck and jaws on pressure over the abdomen. The sacrospinalis and erector spinae muscles were rigid. The normal reflexes were present and no abnormal reflexes were noted. There was a foul, bloody vaginal discharge present.

The blood cell count revealed nothing other than mild anemia and a white cell count of 18,000 with a decided shift to the left. The spinal fluid was clear and colorless, and no cells were found. The Kolmer and Kahn reactions were negative, and otherwise the spinal fluid was normal.

Course.—On the day after admission, the patient passed a small piece of placental tissue, and she began to have convulsions soon afterward. On the third day, her chest became filled with coarse rales, the pulse rate and the respiratory rate increased rapidly and the abdomen became distended and rigid. She died on August 26.

Treatment.—In addition to the use of avertin with amylene hydrate by rectum every four hours, she received 10 per cent calcium gluconate in 1,000 cc. of 5 per cent dextrose in saline solution every eight hours. She was given 3,000 units of tetanus antitoxin intraspinally on admission and the same amount again intraspinally on the following day. During the three days time, she received 150,000 units of tetanus antitoxin intravenously and 10,000 units intramuscularly.

CASE 5.—History.—A white woman aged 34 was admitted Aug. 26, 1940 complaining of stiffness in the jaws and neck. She stated that she had missed two monthly periods and that she had requested a physician to perform an abortion. Three days later she had passed some large clots of blood and a piece of gauze, and on the day before admission she had begun to have stiffness of the muscles of the neck and jaws. There was no history of punctured wounds or other injuries for one month prior to the present illness.

Physical examination revealed stiffness of the muscles of the neck and jaw, and opisthotonos was present. The abdominal muscles were spastic. There was a foul bloody discharge from the vagina. No evidence of punctured or other wounds elsewhere on the body could be found. The temperature was 100.2 F., the pulse rate 120 and the respiratory rate 28 on admission.

Course.—During the first twenty-four hours, the patient had six convulsions and the course was steadily downhill, the pulse increasing and the respiration becoming rapid and shallow, and she died on the third day after admission.

Treatment.—This patient received 60,000 units of tetanus antitoxin intravenously on admission and 40,000 units the following day. Soluble phenobarbital was given in 5 grain (0.32 Gm.) doses every three hours for three doses, but this failed to control the convulsions. Then avertin with amylene hydrate was given by rectum every four hours, with fair results. The patient also received high voltage roentgen therapy to the pelvis on admission. (The dose was not stated.) One thousand cc. of 5 per cent dextrose in saline solution containing 30 grains (2 Gm.) of sulfanilamide was given every twelve hours intravenously. A 25 per cent solution of magnesium sulfate was given intramuscularly every four hours and was accompanied by $\frac{1}{6}$ grain (0.01 Gm.) of morphine. She received also two transfusions of 250 cc. of citrated blood.

COMMENT

It is unusual, I believe, to see 5 patients with puerperal tetanus, all of whom had consulted the same physician within a period of two weeks and all of whom admitted having had a gauze pack placed in the cervix. All of them were admitted to the hospital within fifteen days; 4 died on the third day and 1 survived five days. Four patients had had the pack placed in the cervix six days prior to admission, and the fifth seven days before admission. The onset of the first symptoms in all except 1 of the patients was on the fifth day; 1 felt the first symptoms on the sixth day. The course of the disease was approximately identical in all cases, and no type of therapy apparently influenced the course.

I might say that the reason for the wide variation of the types of treatment given was that each patient was treated by a different private physician. The smallest total dose of antitoxin given was 66,000 units, and the largest was 180,000 units. Intraspinal antitoxin therapy was apparently of no value in the one case in which it was used but apparently did no harm. Various hypnotic and anesthetic drugs used in these cases universally failed to control the convulsions.

As to the causes of death, all the patients suffered embarrassment of respiration, edema of the lungs and collapse of the peripheral vascular system. One patient died suddenly, and the cause of death could not be determined accurately.

The 1 patient on whom supravaginal hysterectomy was done ran exactly the same course as the other patients in the series, and apparently the hysterectomy was of no avail. Her case was interesting because of the fact that the pathologist reported a normal endometrium, and moreover I have never been able to determine from the history or otherwise that she was pregnant.

I feel that all the patients described were infected with the same strain of tetanus bacilli and that it was an extremely virulent strain. I feel also that all the therapeutic measures at hand at the present time in the treatment of tetanus are of little value when the virulence of the organism is great.

I have learned that there were 2 other patients with tetanus who were not admitted to any hospital but who were supposedly infected from the same source, 1 of whom died on the fifth day following infection. The termination of the other case could not be definitely determined.

Clinical Notes, Suggestions and New Instruments

EFFECT OF THE FEEDING OF EGG YOLK POWDER ON BODY WEIGHT

ALFRED STEINER, M.D., NEW YORK

During the course of a study on the serum cholesterol in a series of patients¹ who were being fed on egg powder, it was observed that a gain in body weight occurred. This observation was of interest in view of the fact that previous efforts to improve the nutrition of the subjects under consideration by means of high caloric diets with vitamin supplements had failed. The results of the feeding of egg yolk powder on the body weight of 10 patients are presented here.

A group of 10 patients, 8 with rheumatoid arthritis² and 2 with chronic nephritis without edema, who had been previously hospitalized from two to six months, were observed during a control period of five weeks. A well balanced diet containing from 2,600 to 3,000 calories was fed to the patients during this period. Subsequently the patients were given diets containing from 1,900 to 2,500 calories plus 100 Gm. of egg yolk powder³ for from four to fourteen weeks. One hundred Gm.

varied from zero to 16 pounds (7.3 Kg.), the average gain being 9½ pounds (4.3 Kg.). The average increase per week per person was therefore 1¼ pounds (0.6 Kg.). A total of 25½ and 15 pounds (11.5 and 6.8 Kg.) respectively was gained by 2 of the patients who received the egg yolk powder for two periods.

In only one instance did a patient fail to gain weight, and in this instance the egg yolk was discontinued after four weeks because it was not tolerated well; diarrhea developed on two occasions during the feeding.

It can be seen from the table that a factor other than caloric intake may play a part in the gain in weight induced by feeding of egg yolk powder. The caloric intake of 5 of the patients during the period of such feeding was slightly below that during the control period. The caloric intake of the 5 remaining patients during the period of feeding of egg yolk powder exceeded that during the control period by approximately 200 calories daily.

The status of rheumatoid arthritis in all the patients as measured by the sedimentation rate remained essentially unchanged during the period of feeding of egg yolk powder.

COMMENT

The addition of egg yolk powder to the diet resulted in a gain in weight in 9 of 10 persons. Some factor other than

Effect on Body Weight of Ten Patients of Feeding of Egg Yolk Powder

Actual caloric intake estimated.

of egg yolk powder, on analysis by the R. C. Williams Company, was found to contain 67 Gm. of fat and 22 Gm. of protein, or 620 calories. It was fed in portions of 50 Gm. suspended in milk, with vanilla and sugar added to taste. The total intake during the period of feeding egg yolk powder, therefore, varied from 2,620 to 3,220 calories. Two of the patients were fed egg yolk powder for a second period after an intervening control period.

The accompanying table shows the weights of the patients at the beginning and at the end of the control period and of the period of feeding of egg yolk powder, together with the caloric intake during each period. It can be seen from this table that during the control period in 6 instances a loss of weight occurred varying from ¼ pound to 4 pounds (113 Gm. to 1.8 Kg.). None of the patients gained weight during the control period.

During the periods of feeding egg yolk powder, which averaged seven and seven-tenths weeks, the gain in body weight

the caloric value of the egg yolk powder may play a part in the resultant increase in the nutrition of the body. Egg yolk powder is a rich source of vitamins A and D and the water-soluble fraction of the vitamin B complex. The cost of the egg yolk powder was 15.4 cents daily, or \$1.08 a week, for each patient.

From the data presented it would appear of value to add egg yolk powder to the list of agents used in stimulating an increase in body weight in special instances.

CONCLUSIONS

1. One hundred Gm. of egg yolk powder was fed to 10 patients, 8 with rheumatoid arthritis and 2 with chronic nephritis without edema, from four to sixteen weeks, with an average of seven and seven-tenths weeks.

2. A gain in body weight varying from 5 to 16 pounds occurred in 9 of the 10 persons. The average increase in weight for the group was 9½ pounds. During an initial control period none of the patients gained; 6 actually suffered a loss varying from ¼ to 4 pounds.

3. Egg yolk powder is an economical agent for increasing the nutrition of the body and is, in addition, a rich food source of vitamins A and D and the water-soluble fraction of the vitamin B complex.

A NEW PORTABLE EMERGENCY TRANSFUSION KIT

JOHN R. UPTON, M.D.; B. E. EMERY, M.S., AND R. B. CLARK
SAN FRANCISCO

We are presenting to the medical profession a small but very compact dried plasma transfusion emergency kit. We know its adoption will materially assist in forging a long sought therapeutic weapon for use by the Medical Corps of our armed forces. The adaptability of this kit for use in civilian practice is unlimited.

We do not intend to enumerate the many well proved and clinically sound reasons for the use of plasma or serum. Articles of great value are available to any reader interested in this new phase of blood plasma transfusion therapy.¹

In these grim days the need for some fool-proof dependable transfusion outfit which can be set up by any doctor or well trained nurse and utilized at or near the site where the injury occurred is of tremendous importance. Army, navy, air force and even civilian casualties now can be treated immediately by drawing on supplies in strategically placed depots. Experience in the present war has already shown the urgent need for plasma transfusion in shock, burns and hemorrhage. If transfusion is delayed, inevitable and irreversible changes occur in a large proportion of cases. The need has always been present; recent medical advances now make it practical to fill the demand and in so doing many lives can be saved. The demands made on any product being subjected to conditions encountered in modern warfare are many and varied, but we believe the transfusion kit devised by us will more than meet the strict standards we have formulated. Changes in the kit will undoubtedly take place as time passes; we already have ironed out many wrinkles. In its present form a serviceable unit has been arrived at: it will do its bit.

The requirements are that:

1. The product must possess decided therapeutic advantages over the present commonly used substances.
2. The product to be injected intravenously must be absolutely sterile and not harmful to the recipient. The pyrogen free sterile water accompanying the kit should be used.
3. The product should be easy to administer under the most trying and difficult conditions by medical and nursing staffs not expertly trained in intravenous technic.
4. The transfusion unit must be of such a size that it can be easily transported in quantity by airplane; therefore weight and size are major factors.

(Footnote 1 continued in next column)

5. The accompanying dispenser should be so constructed that the plasma can be given as a hypertonic, isotonic or hypotonic solution according to the type of injury encountered.

6. The product must be prepared and administered by the "closed system" technic—this to exclude any possibility of transference contamination.

7. The product, after reconstruction, must be given immediately.

8. The product must be filtered before intravenous injection.

9. The product should be used with the accompanying intravenous set so that requirements 2, 3, 5, 6 and 8 are complied with.

10. The product should be prepared from pooled plasma, the pool to consist of at least eight to ten individuals.

It is our contention that the kit and contents here described will meet the rigid requirements we have outlined and that these standards must be met by later methods. The original emergency kit will include the following articles. However, two modifications of this set have been devised to meet certain requirements. We believe that type 1 and type 3 kits will be used most frequently. The type 3 kit has been developed to care for those seriously injured patients who require fluid and plasma protein equivalent to 1,000 cc. of whole blood. This set requires a special rig for its manufacture and at the present time there are perhaps not more than three centers in the country that are equipped to handle this type of container. Of course pooling of dried plasma lots would give the quantity, but then transfer contamination again must be considered. The advantages of the type 3 kit are obvious to those conversant with recent trends in blood transfusion work; in the past too small a quantity has been administered in certain conditions such as massive hemorrhage and extensive burns. Reports from plasma centers in England during the last two months support our contentions.

CONTENTS OF KIT

1. Residue from 250 cc. of liquid plasma. On reconstruction with pyrogen free sterile water this would be equivalent to 250 cc. of "wet" plasma or 500 cc. of whole blood. The dry plasma is contained in a 500 cc. vaccine sleeve type rubber stoppered bottle, and this bottle is hermetically sealed in a snug fitting tin can. Cotton wool is tamped snugly about the base and neck. The tin can measures 3½ inches in diameter and is 8 inches tall.

2. Five hundred cc. of pyrogen free sterile water in a calibrated dispenser bottle. This bottle is fitted with the new type sterile cap which ensures sterility after bottling and prevents contamination during administration. The reason we feel constrained to add the 500 cc. container of sterile water is the incontrovertible fact that water is extremely difficult to sterilize

and equally hard to keep sterile. Most reactions to date, as reported by various workers, show that the fault lies in the water used for reconstruction; a pyrogen free sterile water is not the easiest commodity to make.

3. An intravenous needle, size 20; anode rubber tubing of Y design; mechanical filter, and drip chamber; 1 inch number 18 needle attached to the other short arm of the Y tube. This is packed in a sterile manner with the needles being protected by enclosure in a test tube. This segment is united, sterile and ready to use.

4. Four inch number 18 spinal type needle with stylet in sterile test tube.

METHOD OF ADMINISTRATION

The corrugated cardboard container is slit open with a knife along the designated line. The contents are removed and, if no table is available, the cardboard box can be up-ended and used for a table. Any improvised stand can be used to suspend

Emergency transfusion kit.

the bottles; on board ship or in a hospital ward these are always available. If no such stand is available because of an exposed position, use can be made of a sapling, a tent stake or even a gun-stock with the bayonet stuck firmly into the ground. The rate of flow can be accurately gaged by the turn-screw petcock, so that the height of the object used to suspend the bottles plays little role except for support. The tin can is carefully opened by the usual type of can opener, but care is needed to make sure the can is opened at the designated end to avoid damage to the glass bottle. On sliding the glass bottle out of the can, one should place a piece of cotton well soaked in either iodine or alcohol on the rubber vaccine stopper of the dried plasma flask to sterilize the rubber cap. The sealing ring of the 500 cc. sterile water bottle should be undone, but the cap itself must not be taken off until everything is in readiness for the transfusion; i. e., after the arm area of the recipient has been cleansed at the cubital site and the tourniquet or sphygmomanometer cuff placed about the arm but not tightened.

When all is in readiness, plunge the number 18 1 inch needle attached to the short arm of the Y tube just through the vaccine stopper into the powder plasma flask, insert the glass nozzle of the other end of the Y tube through the proper designated hole in the rubber cap of the sterile water bottle (after first removing the cover), holding the cover by the edge to prevent contamination of the underlying rubber insert. Insert the number 18 4 inch spinal type needle alongside the needle already piercing the rubber stopper of the dry plasma flask. This needle is to break the vacuum in the bottle during the reconstruction process and administration and is long enough to clear the fluid. Clamp off with the screw-cock the tube running to recipient's needle; up-end the bottle containing the sterile water so that approximately 100 to 150 cc. flows into the bottle containing the dry plasma; gently agitate this bottle to facilitate reconstruction and dissolving of the plasma residue. The dry plasma or serum will dissolve in a few seconds. When the plasma is completely dissolved, up-end both bottles and allow some water from the 500 cc. flask to run through the tubing; get rid of all air bubbles in the tubing by raising and lowering both bottles several times. The anode rubber permits bubbles to be seen. Another method, after the plasma has been dissolved, is to lower the water bottle, lift the reconstructed plasma bottle and allow the plasma to flow into the water container, from which it will flow to the recipient. This method will not, however, allow for varying the concentration. Tighten the arm band on the recipient and insert the sterile needle into the vein; release the tourniquet pressure as soon as the vein is entered. Gage the rate of flow by the visual drip chamber. Reconstructed plasma may be given rapidly, so that 500 cc. will run in within twenty minutes. This is due to the fact that a person who needs fluid and plasma protein badly will absorb it quickly. If the person requires another bottle of reconstructed plasma, repeat the procedure with another type kit but stick the new recipient needle into the rubber tubing (after cleansing with alcohol) which is already set up and running distal to the mechanical filter and drip chamber of the original setup. In this way, fluid and plasma protein representing 1,000 cc. of whole blood can be given quickly, simply and with the full knowledge that the emergency kit will deliver the plasma proteins to the patient in a sterile manner at a time when they will do the most good. (See sketches also for larger quantity transfusion.)

CONCLUSION

A new emergency transfusion dry plasma kit has been devised. It will adequately meet conditions imposed on it by modern warfare. It will fill a long standing need in civilian life and practice; smaller hospitals, emergency stations, fire houses, industrial factories, oil refineries and forestry outposts should keep such a kit or kits in their emergency lockers. Armed forces ashore and afloat will require large numbers of these or similar kits. They will enable transfusion therapy to be moved to more advanced positions in actual warfare; smaller vessels will have transfusion facilities for their wounded. Gun flash, explosion and incendiary bomb burns will now be treated in the first critical hours.

The financial cost of these kits is small when the life saving properties are considered. The federal government may find it advisable to produce and dispense such units. Our civilian population must realize that its part in the national preparedness program will be to supply blood voluntarily for national defense needs; this is the least it can do to pay for its protection. Such a widespread program would guarantee a constant and adequate supply of dried blood plasma.

Modern warfare with its terrific toll on civilians and armed forces alike make it mandatory to provide for, to protect and to treat as quickly as possible all persons requiring blood transfusions. The emergency transfusion dry plasma kit will provide a strong therapeutic weapon for our medical services.

Two modifications of the original unit are shown. Each one has its special merits.

Special Article

LEGAL RESPONSIBILITY FOR MEDICAL MALPRACTICE

V. FURTHER INFORMATION ABOUT DUTY AND DERELICTION

HUBERT WINSTON SMITH, A.B., M.B.A., LL.B.
Member of the Bar of the United States Supreme Court
BOSTON

This is the fifth of a series of six articles on "Legal Responsibility for Medical Malpractice." The four previous articles were published in The Journal March 8, May 10, May 31 and June 14, respectively.

In a previous article in this series I proposed a comprehensive formula by which one may judge the legal sufficiency of any malpractice claim. This includes four essential components which must all be present concurrently: duty, dereliction, direct causation and damage. Before a plaintiff can make out a prima facie case of malpractice, he must prove each of the four by sufficient evidence to support fact findings by a reasonable man. If he fails to meet this burden of proof, he is not entitled to go to the jury, but the trial court is duty bound, on timely motion, to instruct a verdict for the defendant.

I. DUTY

Now that I have put forward the proposed formula in its simplest form, the reader may profit by a partial unfoldment of the four telescoped concepts. I shall begin with the crucial question of duty. Certain questions in respect to duty should always be asked in appraising each new situation of alleged malpractice. They are:

1. Did a duty arise under the circumstances?
2. Did the scope of duty extend far enough to make the medical conduct complained of a legal dereliction?
3. Had the duty, though once existent, been extinguished before the alleged dereliction occurred?

These inquiries present separate legal questions. If the physician can establish an adverse answer to any one of the three, he will defeat the plaintiff's proof of duty and thus prevent his making out a case of malpractice. These telescoped questions thus stand as main principles in the exploration of duty and, by giving orientation, may protect the reader from bewildering minutiae.

1. DID A DUTY ARISE UNDER THE CIRCUMSTANCES?

To meet this question, which stands at the threshold of every problem of medical malpractice, one must know the possible sources of duty.

Contract Basis of Duty.—It was a favorite practice of early English precedents and indeed of many American decisions to seek the origin of duty in contract. True, a physician does not take with him a pad of blank forms in fine print or say to his patient at the other end of the telephone wire: "I'll be over, old man, just as soon as my lawyer can draw up a contract." Nevertheless, modern law has parted company with the old view founded on rules of the English College of Physicians, that a physician's services represent an honorarium and so he cannot sue for fees. Despite lack of formal bargaining, the usual medical engagement is an implied agreement containing the requisites of any binding contract: offer, acceptance and con-

sideration. The undertakings assumed are sufficiently definite and certain, even though implied, and the contract is legally binding if both parties are competent, that is, not under some such disability as minority or insanity. When a patient summons his physician, he impliedly agrees, in the event his offer of employment is accepted, to follow the reasonable instructions his physician lays down and to pay the fair value of the medical services rendered. The physician, in turn, by saying that he will answer the call, accepts this offer of employment and, by way of consideration, impliedly promises to attend with diligence until the case is properly terminated and warrants that he possesses and will apply average knowledge, judgment, care and skill.

Tort Basis of Duty.—Even in the early cases, the courts began to make it clear that the physician under such employments had a liability to the patient even if the latter was a stranger to the contract and therefore without standing to sue for its breach. Such, in fact, was the dictum laid down by Lord Coke, chief justice of England, in the pioneer case of *Everard v. Hopkins*, in 1615, (Court of King's Bench, 2 Bulst. 332; 80 E.R. 1164). The case concerned a servant who had been hurt by a cart wheel. His master employed the defendant physician to treat the wound. Coke held that for injury occasioned by negligent treatment the servant was entitled to his separate "action on the case" for damages. The duty owed to the servant in such a case does not arise from contract, for the master and not the servant hired the medical practitioner. It springs rather from the affirmative act of the physician in entering on the physician-patient relationship. This origin of a duty of care toward a perfect stranger is not a novel concept. The law of torts,¹ of which the law of negligence is one branch, does not require a person to act toward a stranger. So long as the choice remains unexecuted, the prospective actor may act or not, as he pleases; he is a so-called volunteer. Though he has no preexisting obligation to act or change the status quo, if he voluntarily assumes to do so he becomes at that very instant subject to a legal duty toward the object of his ministrations, to see that his conduct does not carry an unreasonable risk of harm.

The next step in explaining the patient's immediate rights against his physician was legal recognition that a medical dereliction constitutes a "tort" as well as a breach of contract. Hence, even though the patient himself employed the physician, he might elect to consider mala praxis either as a breach of contract or as a "tort" and make either ground the basis of a legal action. If he adopted one theory of recovery in his pleadings, he was held to that theory and the remedies and rules of law which went with it ("theory of the case" decisions).

More recently, the courts have recognized that the law of torts properly governs the usual case of medical malpractice and that if a plaintiff pleads the contract

1. A "tort" is a wrongful invasion of some right of personality or of property of another, causing injury in respect to which the law will give redress by money damages without proof of any contractual or consensual relations between the actor and the person acted on. Tort law might be characterized as the sum total of those legal prohibitions whereby the sphere of individual existence is protected from negligent, intended or malicious conduct of strangers. "The law of torts" is thus a generic term covering a wide variety of such wrongs, including "assault," "battery," "trespass," "conversion" (wrongful appropriation of another's personal property), "false imprisonment," "malicious prosecution" for a crime not committed, "slander and libel," "negligence," "fraud or deceit," "breach of trust," a stranger's act in "inducing breach of contract," "malpractice" of a professional man, violation of patents, trade-marks, copyrights or other vested property rights, "unfair competition" in business and other such proscribed conduct. It is through this branch of the law that such individual rights have received greatest legal protection and the citizen has been insured against unnecessary risks of injury in a crowded society.

of employment it is generally only to show the source of duty. This can be illustrated with cases.

DUTY ARISING FROM CONTRACT

1. No duty rests on a physician to accept an employment. He may refuse arbitrarily to engage his services (*Hurley v. Eddingfield* [Ind. Supreme Court], 1901, 156 Ind. 416, 59 N.E. 1058, 83 Am. S.R. 198; 53 L.R.A. 135).

Example.—Hurley, an administrator of Charlotte Burk, deceased, sued Eddingfield for \$10,000 damages for wrongfully causing the death of his intestate. In his complaint the plaintiff alleged that:

At, and for years before decedent's death, Eddingfield was a practicing physician at Mace, in Montgomery County, duly licensed under the laws of Indiana. He held himself out to the public as a general practitioner of medicine. He had been Charlotte Burk's family physician. She became seriously ill and sent for him. The messenger informed Eddingfield of decedent's violent sickness, tendered him his fee for his services, and stated to him that no other physician was procurable in time and that decedent relied upon him for attention. No other physician was procurable in time to be of any use, and decedent did rely on appellee for medical assistance. Without any reason whatever, appellee refused to render aid to decedent. No other patients were requiring appellee's immediate service, and he could have gone to the relief of decedent if he had been willing to do so. Death ensued, without decedent's fault, and wholly from Eddingfield's wrongful act. The alleged wrongful act was appellee's refusal to enter into a contract of employment.

Defendant filed a "demurrer" in the trial court. "Defendant demurs to each and singular of the plaintiff's allegations and says that same are insufficient in law to state any cause of action." The demurrer is a pleading device by which a party, in advance of trial, can test the sufficiency of his opponent's pleadings. Its effect is to say: For purposes of the pleadings but not for trial, all your allegations are admitted to be true, yet they still fail to set forth facts stating any cause of action recognized by law.

The trial court sustained the demurrer and on plaintiff's failure to amend his pleadings entered a judgment dismissing the case. The Supreme Court of Indiana, through Justice Baker, affirmed the judgment, saying:

The act (Medical Practice Act, 1897) is a preventative not a compulsive measure. In obtaining the state's license (permission) to practice medicine, the state does not require, and the licensee does not engage, that he will practice at all or on other terms than he may choose to accept. Counsel's analogies, drawn from the obligations to the public on the part of innkeepers, common carriers and the like, are beside the mark.

This was the rule at common law before the medical practice acts, and it continues to be so today. The rule at first may appear inhumane, but the law prefers trusting the moral sensibilities of the physician to making him subject to dictation and exploitation by the laity. Imagine the intolerable situations which might arise if the patient could say for the physician whether the case lay within his range of interest or qualification or might be handled in the time available. Such a rule would strip the physician of the rightful control of his medical engagements and make him a menial in the hands of the uninformed.

2. When a physician accepts an employment and then fails to enter on it, with no adequate excuse, his liability is for breach of contract rather than in tort.

Example.—X agrees to attend Y in childbirth for \$25, to be paid by her husband. Y sends a messenger for X when labor pains begin, but he does not come. He is liable, not in tort for negligent performance of the physician-patient relationship, but for breach of contract in failing to establish that relation as agreed.

DUTY ARISING FROM TORT PRINCIPLES

Voluntary undertakings gratuitously assumed raise a duty of medical care in respect to the patient.

1. Duty in respect to "good Samaritan" cases arises only in event the physician elects to proffer medical aid.

Example.—Physician X is passing along a lonely road when he sees the victim of a collision lying sorely wounded by the way. He fails to stop and render aid, which would have prevented a subsequent complication. The injured man files suit against him for professional negligence. X is entitled to an instructed verdict, for he owed no duty to act.

An omission to act cannot constitute negligence, and thus a tort, unless there was some prior duty resting on defendant to act in protection of the other's interests. In cases of the character described, the law places no duty on the stranger to render aid; it is an obligation which is left to the moral judgment of the passer-by.

2. Duty arises when one assumes to treat a gratuitous or charity patient.

Example.—Physician X is a physician in the outpatient department of a city hospital. In treating Y, he negligently inflicts an injury, for which Y sues. X defends on two grounds: (1) that he was acting in the premises only as an employee of the hospital, which, being a municipal institution, is exempt from suit except by its consent and (2) that Y cannot exact a duty of care from the physician such as the law implies in case of employments for gain but receives the gratuitous treatment burdened with any risks of injury.

Neither of these defenses is good. As to the first, the immunity to suit which a municipality enjoys does not extend to its servants, who remain personally responsible in law for their individual torts, even though committed in the scope of their employment. The second contention fails because though a physician may decline to treat a patient gratuitously, if he elects to do so the voluntary assumption of the undertaking raises a duty, under the law of torts, to execute the matter with due care and skill. It is the law that such duty of care is the same as that owed to a paying patient. The relationship may differ in respect to the mode of termination and in the wider latitude in delegating phases of the medical care.

3. On principle, the duty of a physician who assumes to act in a "good Samaritan" case is analogous to that arising from the treatment of gratuitous patients.

Example.—Physician X stops by the side of a busy road to help an injured man, who is unconscious. He tells the surrounding crowd that he is a physician and will take charge. In rendering first aid, he negligently compounds a simple fracture and introduces infection. On proper proof, he is liable, the case being like that of the voluntary treatment of a charity patient. It can be argued that in "good Samaritan" cases the physician should be held to no higher duty of care than a layman, especially when the injured person is unconscious and so cannot be relying on the professional status of the actor. In the case stated, X is assuming charge of the situation as a physician and causes the onlookers to relax diligence in getting the injured man into another physician's hands. Even if the usual rule is applied, that a volunteer's duty in a "good Samaritan" case is only to see that his action does not leave the injured man in a worse condition than when he found him, this very thing has occurred if he displaces available, competent medical care with negligent treatment.

Thus a different result might obtain if the injured man were found on a forsaken mountain road where, if unattended shortly, he would have died from freezing. In this case it can hardly be argued that the physician, by assuming control and applying negligent treatment, has displaced the injured man's likely prospect of competent care. Rather than displacing able medical attention by negligent care to the patient's detriment, the actor has substituted a compound fracture for death. Thus, I believe the proper rule in "good Samaritan" cases is that the physician who assumes to act will be held to the standard of care exacted from physicians. Yet, though he is under a higher duty than a layman and he breaches this duty by committing a negligent act, he may be immune from more than nominal liability in many instances because of failure to prove "damage" (one of the essential four D's of the formula: duty, dereliction, direct causation and damage). In those instances the net effect of his intervention has been to leave the patient in a better or safer position

that Y's parents have a cause of action against X on the ground that the statute raises a duty intended to ensure protection to not only the public generally but to those members of it specifically affected by its breach.

The sources of duty are summed up and analyzed in table 1.

One can see that once the physician-patient relationship arises in fact, by actual entry on it, certain minimum duties attach by law. They are the same whether one traces them to an implied warranty in the contract of employment or to the duty of care which the law of torts impresses on the "volunteer" to see that his affirmative conduct does not carry unreasonable risk of harm to those who might be injured by negligent performance. The tort theory is a more fundamental basis than contract for explaining this "relational" duty, since it accounts for the duty owed in treating a patient who is unconscious or of unsound mind and therefore incapable of "consent," for the duty owed the patient who is a stranger to the contract of employ-

TABLE 1.—Sources of Duty

		Actual Entry on Physician-Patient Relationship	
I. Antecedent Duty to Act			
1. Contract, expressed or implied Raises contract duty to establish physician-patient relationship. If physician fails or refuses to establish the relationship, plaintiff may sue for breach of contract	Duty to establish physician-patient relationship		(x) Assumption to act makes source or existence of prior duty immaterial; duty of care and skill arises under law of torts from the affirmative action toward the patient; questions of malpractice in performance present tort problems (Duty arises) Same result as (x)
2. Duty cast by statute or ordinance If physician fails or refuses to establish the relationship, he probably breaches a duty extending by statutory intent to the injured plaintiff and is responsible civilly in tort for damages arising from his failure to act	Duty to establish physician-patient relationship		
II. No Antecedent Duty to Act			
1. Physician declines, even arbitrarily, to engage his services	No duty to establish physician-patient relationship		(Duty arises) Same result as (x)
2. Petition of gratuitous patient for treatment	Response of physician lies within his discretion		
3. Appeal of injured person by wayside ("good samaritan" cases)			
III. Conclusions			
1. Failure to act can constitute negligence or a medical dereliction only when some preexisting duty to act is owed to the prospective patient			
2. Irrespective of any preexisting duty, once medical care is undertaken the law raises a uniform duty of care and skill in favor of the patient			

than when he found him. There is undoubted negligence (or dereliction) in the insufficient performance of the voluntarily assumed action, but in showing what his position would have been in absence of the defendant's intervention, in seeking to prove damages, the plaintiff's evidence would disclose that his life at the time of the gratuitous act had but minutes or hours to run.

I do not want the physician to believe that he assumes a heavy risk when he helps such a person in distress. Practically, the risk is almost nonexistent; the patient in such circumstances is not apt to press a claim against his benefactor, and juries are apt to be still slower to return fact findings of negligence. Yet, such situations may occasionally arise, and their legal bearings have an inescapable intrinsic interest.

DUTIES CAST BY STATUTE OR ORDINANCE

X is a public health officer charged by statute with the duty of examining persons suspected of having contagious disease, preliminary to isolating them in appropriate city hospitals. A general practitioner reports Y as such a suspected person. X omits to examine and isolate Y, and as a result, Y's eight brothers and sisters contract diphtheria. It is likely

ment, for the duty which arises in treating the gratuitous or charity patient, who gives no consideration for a contract, and lastly, for the obligation of care and skill in "good Samaritan" cases, in which the physician bestows medical attention without prior legal duty or contractual relationship.

Where, then, is the contract of employment of any legal importance? the physician may ask. Briefly, it is most significant as an instrumentality by which physician and patient may regulate their relationship in directions not forbidden by law.

1. The contract of employment secures to the physician legal rights of compensation: (1) If the contract is implied, the patient is held to pay the reasonable value of the services rendered. (2) By valid express agreement (certain in terms, between competent parties and not procured by fraud, coercion or undue influence), the compensation to be paid may be fixed at any figure the parties agree on, without reference to reasonableness.

2. The contract casts a duty on both parties to establish the physician-patient relationship at a future date. A patient can thus secure in advance of treatment the assurance of care by a man whose services are in

extreme demand, such as a specialist in respect to a delicate operation. Dependable engagements contracted in advance enable the physician to arrange his schedule with more certainty.

3. The contract affords a means of adding to, and perhaps subtracting from, the requirements of knowledge, judgment, care and skill otherwise fixed by the law of torts. Normally, these are fixed by reference to the quantum possessed and exercised by the average practitioner in the same community, and it is the duty of the physician to bring this standard of attainment and performance to the case at hand.

If my view is sound, the law of torts, which imposes this duty, in effect says: The law is interested only in assuring to the patient "average attention." If the parties, by express agreement, wish to assume super-added duties, well and good, but failure to perform these *extraordinary* obligations or their imperfect execution is a mere breach of contract; it is not also a tort unless the dereliction involved infringes as well the lesser duty of "average" care imposed by the law of torts.

4. If a contract exists, it may well be that the patient has bargained for the personal skill of the particular physician in the performance of various functions. Under the law of contracts, such personal duties are nondelegable except by the express consent of the affected party.

5. A relationship arising by contract may require different means for its rightful termination.

6. Whether the patient's rights depend on a breach of contract or on a tort is not a scholastic quibble or immaterial question of procedure. Some practical consequences hang on the answer, and these are worthy of consideration.

(1) Under "wrongful death statutes" the cause of action against the physician survives the death of the patient if it springs from a tort but not if it depends on mere breach of contract. At common law, when a person was injured by the wrongful act of another but died before an action could be brought or tried, his claim was thereby extinguished. In brief, there was no liability at common law for negligence which resulted in the death of the injured person. This rule was changed in England by Lord Campbell's act (the Fatal Accidents Act, 1846, 9 and 10 Vict. c. 93), which in effect provided that the claim for wrongful death should not be extinguished by the premature demise of the injured person, but should be preserved to his legal representatives.² Most American states have passed "wrongful death statutes," using the same or

similar language, to carry out in this country what was recognized as an exemplary reform.

The decisions hold that if a complaint in respect to alleged malpractice shows only a breach of contract, it will not support an action for the patient's death brought against the physician under the "wrongful death statute"; if it shows a tort, the action is preserved within the intent of the statute. In the first case the aggrieved party is confined to a mere action for breach of contract which survives to legal representatives under independent doctrines of law.³ So, again, one finds it a pragmatic inquiry to ask: was the "wrong" merely a failure to establish the actual relationship of physician and patient as promised in the contract of employment (breach of contract), or was the wrong a dereliction occurring after actual initiation of treatment (and hence a tort)?

(2) If the injured patient in his claim of medical dereliction can show only a breach of contract, the jury cannot assess punitive damages; if he can show a tort extreme enough to constitute gross negligence, the injured patient is entitled to have the jury assess punitive or exemplary damages.

Example.—Y, being near full term, has her husband engage the services of X, an obstetrician, to conduct the labor for a stipulated fee of \$25. Pains having set in, Y sends for X. Without adequate excuse, X fails to come, by reason of which Y suffers preventable pain and injury. Y can recover actual but not "punitive" damages. American law permits a jury to award the latter by way of example or punishment when the medical conduct is grossly negligent, wanton or reckless. Such damages are not allowed in respect to mere breach of contract, however unwarranted the refusal to perform. The case stated is one of breach of contract to establish the physician-patient relationship, not one of malpractice (tort) under the relationship.⁴

Example. — Y, needing dentures, consults X, a licensed dentist, to have his teeth removed and plates prepared. Under X's supervision and instructions, B, a person without adequate knowledge, skill or experience and without a license, commits gross negligence in extracting a part of the jaw bone under the supposition that he is removing a root. The fracture of the jaw bone is a tort, and Y may recover punitive, as well as actual, damages from X (*Mandeville v. Courtwright* [U. S. C. C. A. Pa.] 1905, 142 Fed. 97, 73 C. C. A. 321, 6 L. R. A. [N. S.] 1003).

If my analysis of the source of duty is applied, one sees that these 2 cases are reconcilable. Though in the second case a contract of employment exists, the entering on the physician-patient relationship has also occurred, giving rise to duties of care sounding in tort. The breach of these duties constitutes a tort, in this case amounting to that gross negligence on which "punitive" damages may be assessed, and the patient does not need to go back to the contract of employment for the source of her rights.

(3) There may be questions as to which statute of limitations shall apply. Early in the history of the common law, it was found that persons with weak or doubtful claims often waited to assert them until the prospective defendant had lost the evidence for his defense by lapse of time or through the death of valu-

2. This act has been further broadened by subsequent amendment: Fatal Accidents Act, 1864, and Fatal Accidents Act, 1908.

1. "When death is caused by negligence, an action shall be maintainable. Whenever the death of a person shall be caused by wrongful act, neglect, or default, and the act, neglect, or default is such as would (if death had not ensued) have entitled the party injured to maintain an action and recover damages in respect thereof, then and in every such case the person who would have been liable if death had not ensued shall be liable to an action for damages, notwithstanding the death of the person injured, and although the death shall have been caused under such circumstances as amount in law to felony."

2. Action is to be for the benefit of certain relations and to be brought by the executor or the administrator of deceased. "Every such action shall be for the benefit of the wife, husband, parent, and child of the person whose death shall have been so caused, and shall be brought by and in the name of the executor or administrator of the person deceased; and in every such action the jury may give such damages as they may think proportioned to the injury resulting from such death to the parties respectively for whom and for whose benefit such action shall be brought; and the amount so recovered, after deducting the costs not recovered from the defendant, shall be divided amongst the before-mentioned parties in such shares as the jury by their verdict shall find and direct."

3. Action is to be commenced within a year, provided always, that not more than one action shall be for and in respect of the same subject matter of complaint and that every such action shall be commenced within twelve calendar months after the death of such deceased person.

3. *Braun v. Riel* (Missouri Supreme Court) 1931, 40 S. W. (2d) 621, 80 A. L. R. 875; *Thaggard v. Vafes* (1928) 218 Ala. 609, 119 So. 647.

4. *Hood v. Moffett* (Mississippi Supreme Court) 1915, 109 Miss. 757, 69 So. 664, Ann. Cas. 1917 E, 410.

able witnesses. To remedy this, statutes of limitation were passed,⁵ which provided in effect that various grievances must be sued on within a certain time after the cause of action accrued or be forever barred.

This intended purpose to bar stale, and often fraudulent claims and to exact diligence from an aggrieved party has been embodied in the statutes of limitations of the several states. The statutes covering breach of contract give to the injured party a much longer time for filing suit than do those covering tort actions. For contracts, the period usually varies from two to six years, depending on whether the contract is oral (shorter) or written and on the particular state; for torts, the period of limitation varies from one to two years after accrual of the cause of action.

Example.—X, a surgeon, under a contract of employment, operates on Y. Three years later Y sues X for malpractice in negligently leaving a sponge within the wound, a fact discovered six months after the operation. X, by way of defense, pleads that the suit was filed more than two years after the cause of action accrued and so is barred by the statute of limitations. Y maintains that he had the operation under a contract of employment and that consequently his action against the surgeon is for breach of contract, is governed by the four year statute of limitations and is therefore filed in due time.

The courts of most jurisdictions have held that the injury is a tort despite the existence of a contract and so is governed by the shorter period of limitations. This doctrine is favorable to physicians and works to their advantage in defense of malpractice actions.

2. ASSUMING THE DUTY TO THE PATIENT WHICH THE LAW IMPLIES, WHAT IS ITS SCOPE AND MODE OF MEASUREMENT?

On this vital subject, again I shall put the goal of orientation before the ideal of definitive treatment. Many of the principles to be mentioned afford focal points for radiation into extremely important medico-legal problems.

1. NATURE AND SCOPE OF THE DUTY OWED

A physician is required to possess and apply to the conduct of the case such knowledge, judgment, care and skill, in respect to both diagnosis and treatment, as the average physician in the same or similar communities and in the same line of practice would use under like circumstances in light of the existing state of the science.

Failure to Apply Professional Equipment as Common Denominator of Malpractice.—It is the failure to apply this professional equipment which is the vital concern of the law, whatever is the cause of the deficient performance—negligence, intentional disregard or deficient knowledge or skill. Failure to apply the required professional qualities is the common denominator of all malpractice cases.

Misfeasance and Nonfeasance.—A dereliction constituting negligence may consist of an affirmative act ("misfeasance"), or it may consist of an omission to act when good practice would require action ("nonfeasance").

Performance to Meet Standard of "Average Physician."—The law takes as its standard the "average physician"; it does not hold the practitioner to the endow-

ments of genius or even to the standards of the superior practitioner. It does not require him to "do his best," for this is a subjective standard, and though put forward as a test by one or two early cases, it has been abandoned in the later decisions. Such a test would be a cloak for the earnest ignoramus or the sincere person devoid of skill, while making the surpassingly good man liable for performances short of his best, though they were superior to the peak performances of his fellows. The law clings to an objective standard. It also relishes the idea of leaving a margin of initiative to the enterprising, represented by the difference between their personal standards and the much lower "average" standard below which the law first attaches liability.⁶

Standard Fixed by Expert Testimony as to Local Practice.—The standard of acceptable medical practice is established by expert testimony as to the local practice. The physician in a small town or rural community is judged by the level of attainment of his fellows; this is regarded as fair on the ground that they have had like opportunity for experience. Evidence is not admissible to show that his conduct would be considered negligent according to the practice of the "Mayo Clinic" or of other large medical centers.

On the other hand, should he be enterprising enough to apply some proved method newly established by such a center, will the court forbid his bringing in an authoritative expert witness from afar, on the ground that such a physician cannot be familiar with the level of local practice? Some writers on law have implied that such might be the case. This contention I believe to be a mistaken one. Its effect would be to turn against a malpractice defendant a rule invented for his protection. I think the law would permit him to prove by such authorities the propriety of the treatment used, particularly when the question is purely: What is good medicine? He would thus be enabled to counter adverse testimony of less progressive local practitioners who from one motive or another might dislike his innovations. I have not found a specific case dealing with this precise point, but the logic is too strong for the law to deny. Society is interested in having practitioners in remote places adopt proved advances, and a contrary rule would work an undeserved hardship on a progressive physician who chanced to settle among quacks or timid innovators. The true rule probably is that expert testimony cannot be imported from larger centers to charge the defendant physician with a higher duty of care than is current in his own or similar communities, but it can be brought to his aid to rebut a charge that he has acted rashly in his choice of treatment or procedures.

Standard Fixed by Reference to Practitioner's Own Class.—A further illustration of the notion of judging like by like is the rule that a general practitioner's performance is to be judged by the attainment level of the general practitioner, and probably the performance of an intern is to be judged by that of the "average" intern. This "class" system in respect to the standard of care which is applicable is of great importance to young medical graduates. If they leap directly into

6. An interesting consequence follows from the fact that the duty imposed springs from the law of torts and is uniform as to all members of a particular class of practitioners. This is the ruling that self aggrandizement does not increase the duty of care. Thus, in *Schirson v. Walsh* (Illinois Supreme Court) 1934, 354 Ill. 40, 187 N. E. 921, it was held that a physician who proclaimed himself one of the greatest and most skillful plastic surgeons in the world did not thereby become subject to a higher requirement of skill and ability than is expected of the average physician in determining the question of malpractice.

5. Statute 21 Jac. 1, c. 16, 1623.

practice, they assume at once the full duty of the practicing physician; if they become interns, they have a lesser duty while acquiring the "average" skill which only experience can supply. Specialists are judged by average practice of fellow specialists. This is held to be just because the specialist holds himself out as having superior equipment in his limited field, and he charges a correspondingly higher fee to the patient.⁷

An interesting case could arise as follows: Suppose a physician who specializes in the treatment of fractures is going along a road when he sees an unconscious man who has been sorely injured in a collision. He stops to give aid but does not simply splint the limb. He sets the fracture in a way which would be "due care" if done by a general practitioner but is negligent according to the standard of specialists. The unconscious man could not be submitting to treatment in reliance on the supposed superiority of the specialist. It is submitted, therefore, that X would not be liable in an action for malpractice. Such a principle might well be of considerable moment when a specialist acts in a nonconsensual transaction of the character described. If this view is accepted by the courts, they should likewise hold that the specialist can recover only what would be fair compensation to a general practitioner for the service rendered.

Suppose, instead, that X has the injured man, Y, sent to his clinic. On regaining consciousness, Y continues to accept the services of X in reliance on information that he is in the hands of a specialist. The duty of care and the scale of compensation at once revert to the higher level of the specialist.

In Respect to Treatment but Not in Respect to Diagnosis, Practitioner Judged by Principles of His Own "School of Medicine."—The duty of the physician is only to treat according to the principles of his "school of medicine." It is the view of American courts that a patient cannot expect the advocate of one system of medicine to apply the precepts of another. The "school of medicine" doctrine does not, either in reason or under the prevailing legal view, extend to diagnosis. Identification of the illness presents a common scientific question which all schools must answer if their varying treatment is to be directed toward an actual, as opposed to an imaginary, malady.

Duty of Care Is Proportioned to Time, Place and Circumstances.—The duty of care is proportioned to the time, the place and the circumstances. The emergency amputation of a gangrenous leg on a kitchen

table under a kerosene light might represent the highest degree of due care in a backwoods cabin, but if primitive conditions were used in a modern hospital the case would get to the jury on a charge of negligence.

Thus, regard must always be had to the particular emergencies under which the physician acts, the instrumentalities at hand and the alternative courses he has available.

Treatment Must Conform to the Modern State of the Science.—Some physicians believe, but quite erroneously, that any treatment is permissible which once has had the approval of medical science. Such is not the case. The law does not proscribe what is old; if some measure used by Hippocrates is still good medicine, it may be used with impunity. But a duty lies on the physician to conform his practice to the "modern state of the science." He may, therefore, be negligent in using an obsolete method no longer employed by the average practitioner. He might cite the court by book, page and verse authoritative statements from the middle ages that one may judge a specimen of urine by looking at it, but visual examination would not be taken in lieu of a Benedict test for sugar. Physicians are therefore under a legal duty to keep apprised of major developments and abandoned doctrines—a stricture which may console medical students.

Physician Is Entitled to Choose Among Currently Sanctioned Methods of Treatment, Without Liability for Failure to Use the Method of Choice.—In respect to the choice of treatment, it is the law that a physician cannot be held negligent for using a less desirable treatment than the one of choice if both have current medical sanction. Testimony of other physicians that they would have done otherwise is therefore not enough to make out negligence; they must be willing to say that what defendant did or failed to do was improper in the light of average practice. The right of the physician to choose between alternative methods is jealously guarded by the law.

2. "ERROR OF JUDGMENT" AS A DEFENSE TO ALLEGED MALPRACTICE

Further confusion has existed in respect to so-called "error of judgment" as a perfect defense to an action of malpractice. It is indeed true that the law does have a high regard for the untrammelled exercise of professional judgment. This it looks on as one of the most important prerogatives of the professional status. Nevertheless, the law will not permit the doctrine of "error of judgment" to be misused as a cloak for professional dereliction.⁸

For example, suppose a physician comes into the room of his patient, sniffs a few times and, without laying a hand on him, enters a mistaken diagnosis. Suppose further that percussion, inspection of signs and taking a clinical history would have led him right. In such case it is no answer to a charge of negligent diagnosis for him simply to say that he made an "error of judgment." Yet, in its proper scope, the doctrine of error of judgment is important. Originally invented

7. The basis of the rule is stated clearly in *Baker v. Hancock* (1902), 29 Ind. App. 456, 63 N. E. 323, 64 N. E. 38. "It is averred in two paragraphs of the complaint that the appellee 'was making a specialty of the treatment of cancer, and held himself out to the public as a specialist of said disease of cancer, by advertising in the public press, and by other public notices thereof.' A specialist, as the term is here used, is understood to mean a physician or surgeon who applies himself to the study and practice of some particular branch of his profession. Scientific investigation and research have been extended and prosecuted so persistently and learnedly that the person affected by many forms of disease is of necessity compelled to seek the aid of a specialist in order to secure the results thereof. The local doctor in many instances himself suggests and selects the specialist whose learning and industry have given him a knowledge in the particular line which the general practitioner, in rural communities especially, has neither time nor opportunity to acquire. . . . Being employed because of his peculiar learning and skill in the specialty practised by him, it follows that his duty to the patient cannot be measured by the average skill of general practitioners. If he possessed no greater skill in the line of his specialty than the average physician, there would be no reason for his employment; possessing such additional skill, it becomes his duty to give his patient the benefit of it. The appellee, if he held himself out as a specialist in the treatment of cancer, was bound to bring to the discharge of his duty to patients employing him, as such specialist, that degree of skill and knowledge which is ordinarily possessed by physicians who devote special attention and study to a disease, its diagnosis, and treatment, having regard to the present state of scientific knowledge. . . . This is the degree of skill which, by holding himself out as a specialist, he represented himself to have; and it does not lie with him to assert, after securing employment and compensation on that basis, that his representation was not true."

8. In *Schumacher v. Murray Hospital*, 1920, 58 Mont. 447, 193 Pac. 397, the Supreme Court of Montana quoted with approval this passage from *West v. Martin* (Supreme Court of Missouri), 1861, 31 Mo. 375, 80 Am. Dec. 107: "whether errors of judgment will or will not make a surgeon liable in a given case depends not merely upon the fact that he may be ordinarily skillful as such, but whether he has treated the case skillfully or has exercised in its treatment such reasonable skill and diligence as is ordinarily exercised in his profession. For there may be responsibility where there is no neglect; if the error of judgment be so gross as to be inconsistent with the use of that degree of skill that it is the duty of every surgeon to bring to the treatment of the case according to the standard indicated."

to protect the surgeon or physician, who at times must act almost instantly in emergencies without prior leisurely investigation of all the material facts, it still finds its chief application to those situations.⁹

When time and opportunity exist, the law requires the physician to employ his fact-finding powers, in accordance with "average" practice, before he exercises his judgment. Scientific tradition dictates that medical decisions must be grounded on objective facts when ascertainable. It is an enlightened judgment which is wanted. If the physician has thus previously gathered his facts with due diligence and they are susceptible (per "average" standards) of more than one interpretation, he is not negligent if he falls into error in adopting one of the possible interpretations. If the facts are 2 and 2, the answer can only be 4, and he is negligent if he finds otherwise; but if the facts are 2 plus 2 or 3, this second digit being blurred to the "average" practitioner even after due investigation, he is not negligent if he finds the answer to be either 4 or 5. The "error of judgment" doctrine, therefore, protects the untrammelled exercise of judgment against charges of negligence in certain cases, even when it results in mistaken conclusions, as for instance when:

1. A surgeon acts in an emergency, as in the foregoing example, and the action he takes on the supposed necessities is not of itself negligently performed. In this case it is the judgment of the physician as to *what* the facts are that is protected, and he is safe if he conforms his treatment thereto and applies it with due care and skill.

2. A physician satisfies his fact-finding obligations and applies average judgment to the interpretation of equivocal facts, or he applies average judgment in choosing among possible diagnoses or conclusions to which *unequivocal* fact findings may point.

In the latter case, the situation, after investigation with due care, may be found to be:

(1) The facts are A, B, C and (D? or E?). He may be forced to decide, by using "average" judgment, whether the fourth fact is D or E.

(2) The facts are unequivocally A, B, C and D. They raise diagnostic possibilities E and F. He may be forced to decide, by using "average" judgment, whether the facts really point to E or to F.

(3) In treating a known condition he adopts of several currently sanctioned methods of treatment that preferred by the minority.

3. PHYSICIAN NOT A GUARANTOR EITHER OF DIAGNOSIS OR OF TREATMENT

A physician is not a guarantor either of his diagnosis or of his treatment, and the required negligence necessary for his liability is not made out by mere evidence of results of treatment or a failure to cure or a disappointing result.

4. PROOF OF "PRIMA FACIE" CASE OF MALPRACTICE

To make out a "prima facie" case of malpractice against the physician, a patient must prove the four D's—duty, dereliction, direct causation and damage—by a preponderance of the evidence, and when any of these elements depends on expert testimony lay evidence will not suffice. The competency of the witness as an expert is to be determined by the court on

"voir dire" or qualifying examination before he is allowed to testify. The court should be exacting in this respect. Qualifications of a practitioner to speak on technical phases of a specialty foreign to his own knowledge and experience should be scrutinized more closely than in the past. Mere possession of the degree of Doctor of Medicine should not qualify automatically in all instances.

5. PHYSICIAN RESPONSIBLE FOR DERELICTIONS OF SERVANT

A physician is responsible for the conduct of an agent or an employee who acts under his immediate supervision or control and is thus his "servant" in legal parlance. Generally speaking, responsibility follows control or joint control of the medical transaction. Such responsibility may attach to a physician who has relinquished control but in the exercise of due care should have retained it, as when a skilled operator in the middle of a delicate operation without imperative cause turns over the completion of a task to one whose inadequacy should have been recognized.

Examples.—1. A dentist, X, orders a "servant" to remove a supposed root. In fact, it is a part of the jaw bone, and the "servant" fractures the jaw. X is liable. It was his duty to maintain control. Such cases arise when a physician whose personal skill has been bargained for delegates vital functions of the medical management to others without the patient's consent. Such a delegation makes the physician as liable in tort for the dereliction of his substitute as though he were performing the malpractice. Even if no tort is committed, the unauthorized delegation of a personal duty is a breach of the contract of employment, giving the patient a right to terminate it and to refuse payment. In the case related above, the dentist is liable, as "master," for the negligence of his "servant" committed in the course of employment. But he would also be liable, though out of control, if without the patient's consent he relinquished a nondelegable function to an independent person who performed the task negligently. Such would be the case, for instance, if he called a fellow practitioner from an adjoining office to give assistance in respect to a patient under anesthesia, and so unable to consent, and the physician called in was negligent.

2. X, the head of a roentgenologic department, is sued by Y for the negligence of Z in burning him by over-exposure. This function Z, carried out as an independent employee of the hospital, without any immediate control or supervision by X. Y is the "servant" not of X but of the hospital. His conduct cannot be imputed to X. X is not liable.¹⁰

3. Suppose the case is the same as the preceding one, except that X and Z are partners in business for themselves. X is jointly liable for a tort committed in prosecution of the partnership business even though he had no part in it.

Possible liability as a joint collaborator must be remembered. When physicians acting together commit a tort, each can be held responsible for the entire result. When two physicians are hired jointly as collaborators, in the absence of contrary instructions they have a right to effect a reasonable division of labor by dividing the functions to be performed. In such case, physician X needs to protest only such negligent performances of functions assumed by Y as occur in his

9. *Staloch v. Holm* (Minnesota Supreme Court) 1907, 100 Minn. 276, 111 N. W. 264, 9 L. R. A. (N. S.) 712, and *Luka v. Loevrie* (Michigan Supreme Court) 1912, 171 Mich. 122, 136 N. W. 1106, 41 L. R. A. (N. S.) 290.

10. *Withington v. Jennings* (Supreme Judicial Court of Massachusetts) 1925, 149 N. E. 201, 253 Mass. 484.

presence. He is under no responsibility in respect to negligent performance of his collaborator which he neither actually sees nor should have seen.

4. With patient B's consent, X chooses a substitute, Y, to act for him during his vacation. Y is negligent, and B sues X. X is not liable if he exercised due care in selecting one he reasonably thought to be competent. He had no control or supervision over Y, and Y must therefore be considered an "independent contractor."¹¹ (An independent contractor is one who performs an assigned piece of work by his own means, methods and judgment, free of the supervision and control of another, and usually under a contract for an "end result." In contrast, a servant works at the hours and times his employer specifies and receives a wage rather than a contract price, and his physical conduct in the performance of his duties is subject to the direct, and often minute, supervision and control of the master.)

5. X, a general practitioner, is consulted by patient Y. Certain laboratory work is needed which Y reasonably supposes X can do. As a matter of fact, X is familiar with the technics involved, but not having sufficient apparatus he farms the work out to Z, an independent professional technician. Z negligently arrives at erroneous conclusions, as a result of which X applies contraindicated, injurious treatment. Y sues X, claiming that he committed a breach of contract by delegating the work to Z without her consent. She also contends that X is responsible in tort for the negligence of Z. In respect to the first contention, the question is whether the work fell within the sphere of the special skill which Y could suppose she was getting in hiring X. If so, he could not delegate away this personal duty to an independent contractor without his employer's consent. To do so would constitute a breach of contract affording good cause for its termination. But if, as in this case, the work stood on the footing of routine work of simple character not calling for special skill, X could rightfully delegate the work to Z without first procuring the patient's consent. Once it is conceded that the work can be rightfully delegated under the contract without express authorization, X cannot be held liable for any negligence of Z in its performance, for Z is acting in the premises as an independent contractor. In each case of this type the crucial question is whether the patient had bargained for and reasonably expected X to do the work even though the test was a conventional procedure.

Assume that in respect to some extraordinary and usually nondelegable function, special laboratory work calls for apparatus which the physician does not have, and he suggests the employment of Z. In such event, while acting with the consent of his employer to the proposed delegation, he is liable only if he is negligent in selecting Z as an independent contractor at the outset. This depends on whether X knew or should have known, in the exercise of due care, of Z's incompetency. Otherwise, he is not liable for Z's negligence. Y should sue Z. The latter rule would apply to delegation by a private practitioner of work which the patient must realize calls for elaborate equipment the physician does not have, as when another person is called in to make roentgenograms or electrocardiograms with portable apparatus. It was held, on the other hand, in *Jenkins v. Charleston General Hospital* (West Virginia Supreme Court of Appeals) 1922, 90 W. Va. 230, 110

S. E. 560, that a patient of a hospital could rightfully suppose that the institution was equipped to diagnose his disorder and treat him as he had been led to expect. Hence, the negligence of an independent x-ray technician to whom the making of roentgenograms was delegated in failing to take the adequate views of plaintiff's arm necessary to a correct diagnosis, must be referred back to the hospital on master-servant principles. The hospital was held liable, but it must be pointed out that there is a split of authority as to whether the operator of x-ray apparatus is a "servant" or an "independent contractor."

Through an abundance of caution, the physician should always procure consent of the patient, in advance, to the proposed delegation of any significant function.

Of course, X is responsible for the negligence of his own technician, for she is his "servant," and a master must answer in law for the torts of a servant committed in the course of employment. The claim of a master that he hired the servant to be careful not careless and that any negligent conduct therefore falls outside the scope of employment is not a legally effectual contention.

6. It seems that on legal principle when a private physician assumes the care of a gratuitous patient he can no more delegate unique aspects of his professional care without consent in advance than in the case of the paying patient. Thus, in the absence of crucial emergency to substitute another for himself in the performance of an operation after such a patient is anesthetized and so without his consent would constitute a tort. The right to pass the patient from hand to hand may arise from implied consent when the patient can reasonably be bound to knowledge of such a custom, as in attending outpatient departments or large hospitals. Under such circumstances the physician may delegate any part of the care of the patient to colleagues without prior consent, subject only to the requirement that he use due care in selecting a competent person.

6. DUTY IS OF CONTINUING CHARACTER

The physician has a duty to make periodic examinations as needed, to give proper instructions to the patient, to attend him as often as good ("average") practice requires and to cease his attentions only when they no longer appear to be reasonably necessary or when the physician-patient relationship has been properly terminated by mutual consent, at the instance of the patient without prior notice or by the physician after reasonable notice in advance.

7. CONSENT OF PATIENT IS NECESSARY TO "TOUCHING" OF HIS PERSON AND BROAD CONSENT IS DESIRABLE FOR SURGICAL OPERATIONS

The physician owes a duty to obtain consent, express or implied, for any touching of the patient, either by way of physical examination, punctures of the skin, injections or operations. Implied consent may protect against a claimed battery, as for instance an allegedly unauthorized operation, but it is a dangerous and slippery justification. A surgeon should operate only on written consent authorizing such surgical procedures, operations and medical measures, to be applied by the surgeon in charge, his assistants or duly qualified substitutes, as in the judgment of said surgeon or qualified assistants or substitutes seem proper after the specified operation is begun. This should be signed by the patient or, if he is a minor, by the parent or legal

11. Accord: *Myers v. Holborn* (1895), 58 New Jersey Law (25 Vroom) 193, 33 Atl. 189, 30 L. R. A. 345, 55 Am. St. Rep. 606; *Hitchcock v. Burgett* (Mich. Sup. Ct.), 1878, 38 Mich. 501.

guardian. In emergencies, if express consent cannot be obtained readily and the patient's life is threatened by delay, the law empowers the surgeon, under a doctrine of "implied consent," to operate as necessary. Note that this warrant does not extend to collateral and unnecessary operations.

8. DUTY OF DISCLOSURE

On occasions, the physician comes under a duty of disclosure, as discussed earlier in this paper. In the past, insufficient attention has been given to the prophylactic usages of disclosure and consent. Whenever a physician is in doubt as to whether a proposed action or persistence in a long-continued regimen is for the patient's best interests, he should take inventory of his medicolegal position. He should seriously consider, as most physicians doubtless do, whether prudence and good medical practice indicate the desirability of discreet disclosure to the patient or his immediate family. Suppose he tells the patient that he has been unable to make an accurate diagnosis and suggests a trip to a medical center or a hospital for detailed study. If the patient decides against going, the continuation of symptomatic treatment may proceed with better conscience and with less risk of legal repercussion. To conceal the inability often may render negligent the continuation of a treatment known to be inefficacious. Furthermore, the running of a large bill may become a fraudulent act if it is known that no benefit is being conferred and yet the patient is given to believe that a cure is in progress. I have shown that the consent of a patient, without a disclosure of the material facts due him, may prove in fact to be no consent. When, however, consent of the patient follows full disclosure, certain conduct which might give rise to liability for malpractice may become unactionable.¹² This result can be explained in different cases on different grounds, as for instance: (1) voluntary assumption of (a known) risk by the patient or (2) contributory negligence of the patient operating as a direct concurring cause of the injury.

Contributory negligence of a plaintiff will defeat his action for injury negligently caused by the defendant. The law does not recognize the doctrine of "comparative negligence"; no attempt is made to compare the relative degrees of negligence of the plaintiff and the defendant with a view to fixing "net responsibility." The law does not offset mild negligence against gross negligence. If the plaintiff has been contributorily negligent at all and this has added to the injury, he is barred from recovery. However, his contributory negligence is an affirmative defense which the defendant has the burden of pleading and proving in most states. Furthermore, a defendant who has caused a wilful or wanton injury cannot plead contributory negligence of the plaintiff to defeat his liability.

Situations revolving around the existence of a duty to disclose present novel and intriguing problems. In the English case of *Gerber v. Pines* (High Court—King's Bench Division) 1934, 79 Sol. Journal 13, the facts were these: Dr. Pines had been administering a series of hypodermic injections into the gluteus maximus muscle of Mrs. Gerber in treating her for rheumatism. He employed due care and skill in the performance but broke off a needle, which he was unable

to get out, and did not so inform the patient. Justice du Parc, after holding there was no negligence shown in the mode of injection or in the use of the needle, said, in substance:

The next question was whether the doctor should have told the patient at once of the accident. It seemed to him that a patient in whose body a doctor found he had left some foreign substance was entitled to be told at once. That was a general rule, but there were exceptions. In this case, there was a breach of duty and negligence on the doctor's part in not at once informing either the patient or her husband on the day of the accident. The damages must be very small indeed, and in his view a fair amount to award was five guineas, and there would be judgment for that sum for the plaintiffs, without costs.¹³

In *Hobbs v. Kizer* (U. S. Circuit Court of Appeals for New Mexico) 1916, 236 Fed. 681, 150 C. C. A. 13, the plaintiff was a patient of the defendant. She indulged in illicit intercourse with him and became pregnant. When she told him of her condition, he assured her she must be mistaken and asked to examine her in order to discover what her trouble really was. She consented, and he made an examination with instruments, at the conclusion of which he reported that she had an abscess of the vagina which demanded prompt operation. She consented, and an operation was performed from which she made a rocky convalescence. She filed suit on the ground that, in fact, the defendant had procured an abortion. The Federal Appeal Court affirmed the judgment entered in her favor below on a jury verdict. This type of consent could be regarded as ineffectual because procured by fraud; though there was consent to the operation, the quality of the consent was imperfect because the patient was not put in possession of the material facts to which she was entitled. Alternatively, one might put the case on the ground that defendant had only a limited authorization extending to treatment of an alleged vaginal abscess; any other or additional operations exceeded the consent given.

In *Logan v. Field* (Kansas City Court of Appeals) 75 Mo. App., 594, a physician sued for medical fees. The evidence showed that the defendant had previously paid the plaintiff \$122 for a prior course of treatments lasting several months which gave no relief from the chief complaint, nasal catarrh. On returning to the plaintiff for a further attempt, the patient said: "I don't want to run a big bill; and if you cannot cure me, I want you to tell me so. I have no money to throw away but am willing to pay you well if I can be cured." The physician replied: "I can't tell you now." During the next ten months the defendant was treated by the plaintiff sixty-five times, and at each treatment the plaintiff would say to him: "Your nose is getting along beautifully, beautifully." There was evidence that, in fact, no progress was being made and that the physician had expressed the opinion to others that the defendant's condition was incurable.

The physician recovered his fee in the trial court. That court refused to give the jury certain instructions requested by the defendant, these being to the effect that:

... the defendant had the right to rely on the superior knowledge of the plaintiff to his own, and if the plaintiff knew, or by the exercise of ordinary skill and judgment, could have

12. Thus, even though an operation might not have been necessary, yet had the plaintiff requested or consented to its performance, such consent or request would be a defense so far as that part of the case was concerned. The Nebraska Supreme Court so held in *Mosslander v. Armstrong*, 1912, 90 Neb. 774, 134 N. W. 922.

13. In *Ernen v. Crofswell* (Supreme Judicial Court of Massachusetts) 1930, 172 N. E. 73, 272 Mass. 172, 69 A. L. R. 1140, the evidence was held to warrant a finding that the defendant dentist should either have removed a broken procaine hydrochloride needle from patient's jaw or informed her of its presence there so that she could have it removed. The reasoning applies, of course, to any foreign body lost or left in the patient's body.

known that he could not cure defendant, or that there was great doubt whether he could successfully treat defendant's ailment, or that the treatment would probably be of no substantial benefit, he ought to have so informed defendant; and even though defendant received treatment and plaintiff did not guarantee a cure of defendant, yet, if the plaintiff, under such circumstances encouraged, or suffered defendant to take treatment without informing him that there could be no cure, or that there was great doubt whether he could be successfully treated, or whether the treatment would be of substantial benefit, and that the defendant, relying upon the superior skill of plaintiff, received such treatment in the hope of a cure but actually received no benefit therefrom, then the plaintiff ought not to recover.

The appeal court reversed the judgment entered below for the physician's fee and remanded the cause for a new trial on the ground that the defendant was entitled to the foregoing instructions to the jury. The court indicated that whether the unnecessary and unbeneficial treatment was applied for a long period as a result of deception or because of negligence in failing to follow the patient's clinical course would not vary the result; either finding by the jury on sufficient evidence would defeat the physician's right of compensation.

Carey v. Mercer (Supreme Judicial Court of Massachusetts) 1921, 239 Mass. 599, 132 N. E. 353, holds that in respect to orthodox procedures, such as making roentgenograms for a suspected fracture of the tibia, the physician discharges his duty when he advises the patient to have them made. On the patient's refusal, the physician is not negligent in failing to outline the probable consequences to him of his failure to have roentgenograms made. The Massachusetts Court rests heavily on this chain of reasoning: It is the patient's duty to follow the reasonable instructions of his physician; failure to do so constitutes contributory negligence proximately causing or contributing to the deformity consequent on failure to make an early discovery of the fracture by means of roentgen examination. This reasoning is sound in respect to "run-of-the-mill" transactions. It is not sound in respect to extraordinary ones or to cases in which proposed procedures will radically alter the status quo of the patient, with attendant risk. Some courts might find it difficult to consider the situation before the court in *Carey v. Mercer* as a "run-of-the-mill" transaction and hence to agree with the reasoning on which it was decided. Certainly, most physicians in a case of suspected fracture would consider a missed diagnosis as fraught with such portentous consequences as to require careful explanation to the patient of the need for roentgenograms.

9. DUTY TO REFER PATIENT

Another novel problem to which I should at least allude is the question whether there is ever a legal duty to refer patients. Can the physician, morally and with legal safety say of a patient whom he cannot personally provide with "average" attention: "This is my fish, for better or for worse; I shall not throw him back into the medical pond"? This poses a question apt to become of increasing importance. I do not refer so much to cases in which the physician recognizes an emergency and almost invariably sends the patient to a hospital or to a specialist. I refer, rather, to cases he considers within his own sphere of action though he is not able to apply the learning, skill or equipment called for by current good practice in the community.

As a legal proposition, a physician courts the risk of liability for malpractice when, though he is unable to provide the facilities which the "average" practitioner knows to be necessary to the patient's interests, he holds on to the patient without disclosing the risk, offering to refer or associating a consultant. The same danger arises when one is able to carry out a desired procedure but only by a method which involves risk of injury to the patient, while others are equipped to apply a method so much safer that all risk is eliminated. The justifiable risk which one is warranted in taking becomes less and less as the harm threatened thereby increases in magnitude.

A highly important decision recently handed down by the Supreme Judicial Court of Massachusetts neatly illustrates the point. In *Vigneault v. Dr. Hewson Dental Company* (Supreme Judicial Court of Massachusetts) [1938] Mass. Adv. Sheets 807, 15 N. E. (2d) 185, the defendants injected procaine hydrochloride by pressure into the plaintiff's gums on several occasions before removing four abscessed teeth; in consequence, severe osteomyelitis of the plaintiff's jaw developed. The evidence showed that the danger of such a sequel was rather slight but that other dentists in the community could have reduced the risk to almost nil because they were equipped to use "deep block" anesthesia, which the defendants did not know how to apply. In affirming a judgment for the plaintiff for \$4,450, based on an auditor's findings of negligence, the highest appeal court of Massachusetts said:

The defendant contends that negligence could not rightly have been found since "danger was remote." But remoteness of danger is a matter of degree. Though the danger was remote, it might, none the less, involve an unreasonable risk of harm to the plaintiff to which dentists, in the exercise of the skill required of them, should not have exposed him. . . . This is particularly true where, as here, the possible harm was of a serious nature. . . . A finding of negligence was not precluded, even though there was a substantial probability that harm might not actually result from the use of this method of anesthetization. A choice by a dentist of a "less safe method" rather than another "well-known method" may constitute failure to exercise the requisite skill in extracting the plaintiff's teeth. See *Galvin v. Old Colony Railroad Company*, 162 Mass. 533, 39 N.E. 186. There is nothing in the findings of the auditor to show that any emergency required the use of the "less safe method" or that a safer method was not available for the plaintiff at the hands of some other dentist. Nor is there anything in the findings inconsistent with the finding that the defendant's dentists should have advised the plaintiff to employ another dentist equipped to use a safer method of anesthetization, rather than have "undertaken a less safe method." Such may be the duty of a dentist who, for any reason, is unable personally to exercise the skill ordinarily exercised by dentists in the community. (*Mallen v. Boynton*, 132 Mass. 443, 446.) See, also, *Small v. Howard*, 128 Mass. 131, 136, 35 Am. Rep. 363. The finding of negligence must stand.

I could cite many cases in which practitioners have been held negligent in failing to seek roentgenograms in diagnosing or following up cases of fractures (with consequent poor end result), even though they themselves owned no x-ray apparatus and the use of the required facilities would have required the original physician to refer the patient to some one else, to call in a consultant with a portable machine or even to surrender the care of the patient to a hospital.

This duty of reference, which so lately has entered into cases at law, is of profound importance because of the increasing disparity between the equipment an individual physician can afford and that available in

hospitals or other medical institutions. Whether the duty to refer exists in a given case can, with a near approach to accuracy, be answered by adverting to this important criterion: what is the practice of the average prudent physician in the community in respect to referring a case such as this? When I allude to a duty to "refer," I wish it understood that this duty often can be met as satisfactorily by associating a specialist in the joint conduct of the case.

10. WAS THE ALLEGED DERELICTION ACTUALLY
OUTSIDE THE SCOPE OF THE PHYSICIAN'S
EMPLOYMENT?

Inquiry should always be made as to what was the problem of health which the physician in the particular case was called on to handle. Does the alleged dereliction apply to some ailment which really falls outside the scope of his employment?

Example.—X, a general practitioner, was called to treat Y for typhoid fever. This he did with success. During the same time, Y had been having subjective ocular symptoms and disturbances of vision, due to a local condition in the eye, which fell within the province of an ophthalmologist. Y later lost the sight in one eye, and an oculist testified he could have saved her sight had she been sent to him earlier. She sued X for negligence. (*Jones v. Vroom* [Court of Appeals of Colorado, 1896] 8 Colo. App. 143, 45 Pac. 234.)

The upper court held that the trial court properly instructed a verdict for X, since Y had employed him only to treat the typhoid fever; the other complaint lay outside the scope of his employment. He had no duty to treat the ocular condition. In respect to the duty to refer, the evidence clearly showed that Y herself was aware of the condition of her eye and of the need of an ophthalmologist and that she could have procured the services of one by telephoning to a nearby town. It was as though X had told the patient of an ocular condition which fell outside his field of practice and had advised her to see some one else. The case could therefore rest on lack of proximate causation: the patient's own neglect was the proximate cause of the injury she suffered. The case is thoroughly sound, except for the embarrassing fact that X had promised to procure an ophthalmologist for Y and did not. The court reasoned that when Y saw, after many days, that X was not going to act she, herself, could have telephoned an ophthalmologist. The fault of such reasoning is this: Y could reasonably suppose that X, as an informed man, could procure for her a more suitable specialist than she herself might choose and so could justifiably await his action, with resulting detriment. Even in 1912, this feature would have carried danger of liability had Y offered, as she did not, medical testimony that local practice deemed it negligent for a physician to fail in the execution of a voluntarily assumed undertaking to procure suitable medical aid. As the general physician more and more acquires the status of a family counselor on health, the reasoning on which this case was rested becomes less and less valid.

11. LEGAL EFFECT OF VOLUNTARILY ASSUMING
HIGHER DUTY THAN PHYSICIAN-PATIENT
RELATIONSHIP WOULD CREATE

I have pointed out that the scope of duty can be voluntarily enlarged by express contract provisions. It is my theory that infringement of these "extra security" clauses, with nothing more, constitutes only breach of contract and not a tort.

As illustrations, I can cite instances in which the physician has "guaranteed" a cure to the patient. These contracts form a class which may be called "no cure, no pay" agreements, for if the physician does not fulfil the guarantee, no obligation to pay arises. But this failure to perform a greater duty than the law implies, with no "dereliction" as judged by "average" standards, does not constitute a tort. It is not malpractice at all but a mere breach of contract. It is important for the courts to receive and to apply this distinction.¹⁴

12. TO WHAT EXTENT CAN SCOPE OF DUTY BE
REDUCED BY EXPRESS CONTRACT?

Can the scope of duty be reduced by express contract and, if so, in what respects? I believe that the scope of medical duty can be lessened only to the extent that disclosure to the patient and the latter's consent can effect a reduction of duty, as previously described.

Suppose X, a physician, goes further and has his patient sign a written contract reading: "Y, as patient, in consideration of his treatment by X, hereby agrees to waive all requirements as to knowledge, judgment, care and skill and any claim for damage arising from failure to apply same to his medical care." Such a contract would defeat the public policy of maintaining a minimum standard of skill in the practice of medicine, since licensure statutes can adequately protect only against want of knowledge. It would also open the door to imposition on the weak and the credulous. Society has an interest in securing the health of its citizens, both in respect to preserving their economic self sufficiency and in keeping them fit for the possible defense of the nation. It has a further interest in protecting the more proficient physician from the irresponsible competition of a class relieved by "contract waivers" from the responsibility which every conscientious physician considers rightfully his in dealing with patients. For these reasons, whenever "total waiver" clauses come before the courts, they have good warrant for holding them void as against public policy.

13. WHAT ARE THE SALIENT PRINCIPLES OF
CRIMINAL RESPONSIBILITY FOR
MALPRACTICE?¹⁵

I have already shown that criminal liability for murder, manslaughter or assault and battery can be based on reckless conduct, even though there was no intention to cause death or to inflict injury. The degree of recklessness which must be found for criminal liability is greater than the minimum necessary for civil liability for malpractice. For murder, the jury must find that the course of treatment was "imminently dan-

14. The distinction I contend for has been indirectly recognized in *Frankel v. Wolper*, 1918, 181 App. Div. 485, 169 N. Y. Supp. 15, a case in which the court had occasion to state the measure of damages recoverable for breach of an agreement to cure. It said: "The defendant would not be liable, upon his agreement to cure, for plaintiff's pain and disability resulting from the conditions to be cured, or for pains and disabilities caused by defendant's ignorance, or lack of skill, or for pains and disabilities caused by subsequent operations to cure her of her malady, or to avert the consequences of defendant's lack of skill, or failure to perform his contract, or expenses to alleviate any such pains and disabilities. The contract to cure was not that the defendant would, upon failure, pay the damages resulting from her malady continuing, or for the results of his lack of skill, or ignorance, or for the physical consequences of treatment by other physicians necessitated by her condition. The thing he undertook was to cure her. That did, indeed, involve the elimination of the condition that begot suffering and disability. But a physician cannot be held responsible for suffering from a cause which he agrees to end, but does not, unless he is guilty of malpractice. . . . I would say, also, that where a physician, with whatever prudence, agrees that his treatment will cure, and it does not, the patient is absolved from payment, may recover advances, may recover expenditures necessitated for nurses and medicines, and may be for something else." (Affirmed: 1920, 228 N. Y. 582, 127 N. E. 913.) Whether the damages for breach of a guaranty to cure will be so confined by the courts of all states is subject to some doubt on legal principle.

15. Mr. Livingston Hall, professor of criminal law, Harvard Law School, supplied the material contained in this section.

gerous to the patient" and showed a "depraved mind regardless of human life." Typical examples in the law include shooting recklessly into a house or a vehicle in which people are known to be or driving through a crowded street at extreme speed while intoxicated. Obviously, it is highly unlikely that any physician would be guilty of such gross dereliction of duty as to incur liability for murder on this ground.

There are a number of prosecutions against physicians for manslaughter, instances in which death has been caused by the gross negligence or recklessness of the attending physician. In England, it has been well settled that:

... in order to establish criminal liability the facts must be such that, in the opinion of the jury, the negligence of the accused went beyond a mere matter of compensation between subjects and showed such disregard for the life and safety of others as to amount to a crime against the State and conduct deserving punishment. (*Rex v. Bateman*, [1925] 19 Cr. App. Rep. 8.)

The matter was more recently put by the House of Lords in a case involving reckless driving thus:

Simple lack of care such as will constitute civil liability is not enough; for purposes of the criminal law there are degrees of negligence: and a very high degree of negligence is required to be proved before the felony is established. Probably of all epithets that can be applied "reckless" most nearly covers the case. It is difficult to visualize a case of death caused by reckless driving in the connotation of that term in ordinary speech which would not justify a conviction for manslaughter: but it is probably not all-embracing, for "reckless" suggests an indifference to risk whereas the accused may have appreciated the risk and intended to avoid it and yet shown such a high degree of negligence in the means adopted to avoid the risk as would justify a conviction. (*Andrews v. Director of Public Prosecutions* [1937] A. C. 576.)

It will be noted that by these English cases there can be no conviction for manslaughter unless the defendant has appreciated that there is a considerable risk of death involved and has either failed to take precautions or has taken inadequate precautions to guard against it. In some American jurisdictions a similar requirement is found, and a physician who honestly believes that no substantial risk of death is involved in his treatment cannot be convicted (*State v. Shultz*, [1881] 55 Iowa 628, 8 N. W. 469, 39 Am. Rep. 187).

In some American jurisdictions, however, a conviction for manslaughter has been upheld when the conduct of the physician was grossly negligent, even though it cannot be proved that the physician realized that his conduct was dangerous. Justice Holmes, in affirming a conviction of manslaughter against a physician who had treated a woman by keeping her in flannels saturated with kerosene for three days, apparently in the honest belief that this treatment would be beneficial, put the test thus:

The defendant knew that he was using kerosene, the jury have found that it was applied as a result of foolhardy presumption or gross negligence, and that is enough. Indeed if the defendant had known the fatal tendency of the prescription, he would have been perilously near the line of murder. (*Commonwealth v. Pierce*, [1884] 138 Mass. 165, 52 Am. Rep. 264.)

The same standard as to recklessness is applied in a prosecution for assault and battery for causing injury short of death by reckless conduct as is applied in determining whether the defendant would have been guilty of manslaughter if the victim had died.

3. HAD THE DUTY, THOUGH ONCE EXISTENT, BEEN EXTINGUISHED BEFORE THE TIME OF THE ALLEGED DERELICTION?

Suppose, as in the usual case, the physician is treating the patient under an implied contract of employment. It is expected that he will visit as frequently and as long as is reasonably necessary. There is no specified time limit to his connection. The relation may be ended at once by mutual consent or after any given visit by notice from the patient. Since protection of the patient's health is of prime concern, the physician cannot sever his connection so abruptly. He can withdraw in absence of the patient's consent only after giving reasonable notice in advance, so that the patient may have a fair opportunity to engage a successor.

Suppose the treatment is under a formal contract. In this case, the relation ends only when the performance specified in the agreement is concluded. The patient cannot discharge the physician before that time except for cause, that is to say, a breach of contract.

If the patient knows of the custom in advance and the contract does not forbid, a surgeon may leave the care of the patient after an operation to the regular hospital staff.

Thus it is seen that whether the physician's engagement is under express or under implied contract, unless the services are sooner discontinued by mutual agreement or by rightful termination a legal duty exists to attend the patient until he can be discharged safely.

In the case of emergency aid given to a wayside victim, the passing physician who assumes to act comes under no duty to continue the injured man as his patient. His duty is to see that he does not leave him in worse circumstances than those in which he found him. This obligation is discharged either by putting him on the way to a hospital or, after rendering imperative first aid, seeing that the persons who assume charge of the injured man will undertake to get him to suitable medical care within the period of safe delay.

In accepting a gratuitous patient, the physician takes him under no binding agreement to continue treatment for any definite term. He may withdraw after giving reasonable notice of his intention. Theoretically, he can drop the patient "instantly" if he leaves him in no worse condition than that in which he found him. Some courts may hold that the danger of injury to the patient's health from sudden discontinuance raises a duty of advance notice. When such a patient does not assent to the immediate termination and is still sick, the careful physician will do well to give even the gratuitous patient a few days' notice of his withdrawal. Likewise, a hospital cannot afford to order a sick patient to pick up his bed and walk without similar regard to a reasonable opportunity for him to arrange a destination.¹⁶

If the physician will apply these concepts of duty to every action or omission, proposed or past, of his medical conduct, he will come close to knowing whether negligence is involved in the transaction under scrutiny.

II. DERELICTION

My formula of liability for malpractice is duty dereliction, direct causation and damage. Presence of "duty" resting on the physician implies a correlative legal right in the person to whom the duty is owed. "Dereliction" implies a breach of this duty and a consequent invasion

16. However, it seems that a physician can legally terminate his relationship with a gratuitous patient instantly by tender then and there of a competent substitute.

of plaintiff's legal right. Duty and dereliction are thus closely intertwined, and in dealing with dereliction in this section I am in measure recapitulating all the duties owed by the physician and asking whether he has breached one of them. Indispensability of the concurrent existence of all four D's must never be lost sight of; mere faulty performance, in absence of any duty, constitutes no legal wrong. Conversely, mere duty, without proof of faulty performance, constitutes no legal wrong in respect to which recovery at law can be had.

It is important to grasp the rather neat point that not all legal liabilities arising from medical conduct are malpractice. This is a concept worth stressing, both in elucidating the legal position of the physician here and in appearing before courts. Even though the measure of damages will often be the same, the physician is entitled to have the rather malignant term "malpractice" correctly applied and not used in a loose and overbroad sense. Table 2 seeks to embody this proposition and to make the correct analysis clear.

TABLE 2.—Legal Liabilities Arising from Medical Conduct

A. Distinction Between True Malpractice and Liabilities Resting on Independent Grounds	
1. Malpractice	2. Not Malpractice
(1) Liability for tort (negligent practice, etc.) to one who is a patient	(1) Liability for failure to fulfil superduties assumed by contract; this is mere breach of contract. Level of performance required by superduties assumed by contract (A-B)
(2) Liability for medical conduct toward a patient which would constitute a tort without existence of physician-patient relationship (e.g. false imprisonment or battery)	Duty of care, knowledge, judgment and skill required by law of torts without any express agreement (O-D). In event of superduties assumed by contract: performance W-X = breach of contract only, performance Y-Z = tort and malpractice as well as breach of contract
(3) Liability for faulty medical conduct (1 or 2) intended to affect the other person, even though that person's unwillingness to accept the actor as his physician prevents true consensual relationship of physician and patient from ever arising	(2) Liability for failure or refusal to establish physician-patient relationship as agreed in advance by contract. This, likewise, is a mere breach of contract
	(3) Medical conduct which is negligent as to third persons not intended to be affected but injured by careless practice
	Example: Surgeon X, while attending the plaintiff's husband, directed the plaintiff to assist in dressing a wound, knowing there was danger of infection but negligently assuring her to the contrary. The plaintiff relied on his advice and was infected through scratches on her finger. X is liable. (Edwards v. Lamb [Superior Court of Judicature, N. H.] 1889, 45 A 480, 60 N. H. 590)
	Example: J. was the sole attending physician of T. who had black smallpox. J. assured a neighbor, S., that T. had no contagious disease and that S. would take no risk by waiting on him in his illness. S. waited on T. and helped to prepare his body for burial; in consequence, he contracted smallpox and died. J. is liable in a suit for 'wrongful death' brought by S.'s widow, if a general practitioner of average ability should have diagnosed the malady: (Jones v. Stanko [Ohio Supreme Ct.] 1928, 118 Ohio St. 147, 160 N. E. 456)
	The physician owes the duty which the motorist owes, to avoid exposing those in his sphere of action to unreasonable risk of harm; in short, he carries the general duty of care which all persons share
B. More Detailed Analysis of Dereliction in Malpractice	
Dereliction	Negligence
	1. Affirmative act (misfeasance) constitutes negligence if improperly performed even though no preexisting duty was owed to the person affected (no necessity to prove mutually agreed physician-patient relationship but only the physician's assumption to act in a medical way toward the person injured.)
	2. Omission to act (nonfeasance) constitutes negligence only if the defendant owed a duty to the injured person to do the omitted thing
	3. "Ordinary" negligence and "gross" negligence must be distinguished; the latter is such reckless, wanton or extreme negligence that the injured party is entitled to "punitive" as well as compensatory damages
	Intended Acts or Omissions
	1. Battery.—The touching of another without consent, as in operations going beyond authorization or unauthorized physical examinations
	2. False Imprisonment.—The forcible deprivation of the right of another to go where he pleases by holding him captive against his will and without legal justification
	3. Slander.—Physician tells a stranger that patient X has syphilis when such is not true and physician has acted on negligent diagnosis and not in good faith. (Libel if communication is written rather than spoken)
	4. Interference with Property Rights.—Violation of property rights in dead bodies, as by performing unauthorized autopsies. (Coty v. Baughman [South Dakota Supreme Court] 1926, 210 N. W. 348; \$1,500 judgment for autopsy performed without consent)
	5. Breach of Trust Relationship.—(1) Failure to disclose material facts to the patient under circumstances which raise a duty to speak. If the suppression is not intentional, the failure to disclose may be negligence. If intentional, it may constitute actionable fraud or deceit. (2) Query: Liability for disclosure of confidential communication?
	6. Fraud.—Intentional misleading of patient on a material matter, the patient reasonably relying to his injury on a statement of fact
	7. Violation of Certain Statutory Duties.—If intended for patient's exclusive benefit
	8. Professional Conduct Toward Patient Constituting Criminal Law Offense.—This usually confers simultaneous rights on patient to proceed in "tort" for civil compensation of the injury suffered
	9. N. B.: As I have pointed out in an earlier portion of this paper, it is customary in the law of torts to divide wrongs into negligent conduct and intended conduct. Nevertheless, intended conduct, which may be a tort on that score, may also be a tort on the separate or alternative ground of negligence. This is the case if the conduct is of a character called bad practice by the medical profession of the time and place (e.g. when a surgeon, contrary to the customs of surgeons, breaks a united callus without the patient's consent; this act is a "battery" but it is also suable as "negligence")

These are "torts" recognized by general law without need of proving any special relationship such as that of physician and patient. Yet they constitute "malpractice" when committed in medical practice or associated conduct knowingly directed toward another person as the object of the medical attention, even though the strict relationship of physician and patient is not demonstrable

These are "torts" dependent on existence of a physician-patient relationship. In such cases "malpractice" can be made out only by proof that such a relationship existed

No more will be said as to the legal liabilities which may flow from medical conduct independently of malpractice. Table 2, aided by previous discussions, should make this aspect clear. "Malpractice" is somewhat of a "weasel" word. To different minds it has different connotations. First of all, one should distinguish "criminal malpractice," with its implication of moral turpitude, and "civil malpractice," which may be entirely neutral in its moral aspects. It might be argued that the term "malpractice" properly applies only in respect to the alleged wrongful conduct when (1) it occurred in respect to an existing physician-patient relationship and (2) it would constitute no legal wrong in the absence of such relationship. Under this analysis, malpractice would comprise only negligent conduct and breach of those duties which depend strictly on the physician-patient relationship. It would not include battery, false imprisonment, slander or violation of property rights in dead bodies, for this conduct carries legal liability when indulged in even toward a stranger without any proof of a physician-patient relationship. These acts are "torts" on their own, without any necessary reliance on a special consensual relation between the parties.

This approach would be not illogical; its weakness lies in the fact that such a concept of medical malpractice goes too far in excluding from the definition transactions which actually are performed in the course of medical practice. It is better, therefore, to consider "malpractice" as extending to all alleged injuries arising from medical activity or conduct in the course of practice knowingly directed toward another person as the object of the medical attention, even though the strict relationship of physician and patient is not demonstrable.

This concept is broad enough to cover the case in which a physician treats an injured person whose unconsciousness prevents actual consent and the lack of an emergency precludes implied consent. It also covers the cases of treating persons incapable of consenting, for instance insane persons, and a variety of other situations which may arise from time to time.

As illustrations, I shall mention briefly two interesting decisions. In *Harriott v. Plimpton* (Supreme Judicial Court of Massachusetts) 1896, 166 Mass. 585, 44 N. E. 922, the plaintiff was engaged to be married to the daughter of X. He was seen by a fellow lodger treating a traumatic lesion of his genitals. This officious busybody relayed his observations to X. The latter much desired the plaintiff to consult the defendant in order that an examination for venereal disease might be made before the nuptials were performed. The plaintiff willingly acceded and repaired to the defendant's office, never intending to become the latter's patient. Note that the defendant did not make his examination with a view to treatment but solely for the purpose of giving information.

The defendant made a negligent diagnosis of gonorrhea, which was duly communicated to X and his daughter, with the result that the engagement was broken. In fact, the plaintiff had no venereal disease whatever. He sued the defendant, and the jury found the examination was negligently performed. From a judgment for the plaintiff on the verdict, the defendant filed a vigorous appeal. The Supreme Judicial Court of Massachusetts held that duty existed despite the nontherapeutic purpose of the examination, that the defendant breached the duty by his negligent examina-

tion and that the breaking off of the engagement to marry was not too remote or unforeseeable a consequence to constitute a legal damage. The court affirmed the judgment for the plaintiff.

In *De Freville v. Dill* (King's Bench Division) 1927, 105 Law Journal 1056, 96 L. J. K. B. (N. S.), an interesting situation came before the English courts. A had married B, the son of a vicar, X. B, having tired of his "better half," returned to his point of origin, where he was warmly welcomed by X and reincorporated into the household. On several occasions, A forced her way into this same haven, feeling her matrimonial rights extended to the privilege of being with her husband, though to X she was a persona non grata. After one such episode, when A had entered X's household by the back way, X promptly called in Y, a local practitioner, to make a psychiatric appraisal. After several calls, colored by a distinctly negative attitude on the part of A to this scientific "sizing up," Y signed a lunacy certificate and had A carried to a mental hospital pending final hearing. A day later, the physician-in-chief of the mental hospital promptly discharged A as a sane person, and she filed suit against Y. The jury specifically found that no relationship of physician and patient existed, for A never agreed to take Y as her doctor and, in fact, looked with hostility on his interference. They also found that Y acted in good faith and without malice but negligently. The Court of Appeals held that a verdict and judgment in A's favor against Y must be affirmed. The recovery was for £50.

In the usual case, a relationship of physician and patient will exist by mutual understanding of the parties. Furthermore, "negligence" will usually be the fault charged. Such dereliction in the medical conduct usually consists of some act or omission which threatens a foreseeable, unreasonable risk of injury to the person affected. In such case, the conduct is negligent if the "average" practitioner would regard the act or failure to act as bad practice. I have shown that a mere failure to act is not negligence unless there is a duty to act. What is an unreasonable risk varies with the magnitude, imminency and gravity of the harm which may ensue and the counterbalancing good to be secured. Thus, even a small risk which threatens the loss of a man's life may well be unreasonable and so negligent, while a greater risk of a much lesser harm, such as temporary induration of an arm from a testing for serum sensitivity, might not be negligent. The interest to be secured by the proposed conduct and the likely results of contrary action, as shown by competent medical testimony, are also to be weighed by the jury in determining the crucial question of negligence. The fact of a patient's consent, after a full disclosure, may at times strip a transaction of its negligent character, as when an unnecessary operation is done as a "long chance" at the patient's behest.

Yet, though "negligence" is by far the most common form of malpractice, it is not the only culpable medical conduct directed toward another which may constitute an actionable tort and so a "dereliction." As I have said previously, "torts" are all those injuries to the rights of personality or property of one person occasioned by invasions of another person which occur without legal justification. The variety of "torts" which may constitute malpractice because they arise from medical conduct directed toward another is illustrated in part B of table 2.

(To be continued)

Council on Pharmacy and Chemistry

REPORTS OF THE COUNCIL

BECAUSE OF THE NEED FOR AN AUTHORITATIVE STATEMENT ON THE PROPERTIES OF THE SYMPATHOMIMETIC AMINES AS SUBSTITUTES FOR EPINEPHRINE, DR. M. L. TAINTER, WHO HAS DONE MUCH WORK IN THIS FIELD, WAS ASKED TO PREPARE A SUMMARY OF RECENT WORK ON THIS SUBJECT. IN AUTHORIZING PUBLICATION OF THE FOLLOWING REPORT THE COUNCIL WISHES TO EXPRESS ITS APPRECIATION TO DR. TAINTER FOR HIS EXCELLENT SUMMARY.

OFFICE OF THE COUNCIL.

THE SYMPATHOMIMETIC AMINES AS EPINEPHRINE SUBSTITUTES

A GENERAL SUMMARY

M. L. TAINTER, M.D.

SAN FRANCISCO

Since the introduction of epinephrine as a therapeutic agent some forty years ago, there has been an increasing interest in possible synthetic substitutes which might have advantageous qualities over that of the original drug. Ephedrine and tyramine, which occur in nature, have been thoroughly studied but are being encroached on by synthetic agents of related structure. This report is concerned with certain aspects of the chemical composition and actions of those members of this group which are now being advocated and made available in this country for clinical use.

GENERAL CIRCULATION

The most striking action of these drugs is their power to stimulate the circulation. The pressor effects are produced by arteriolar constriction and possibly increased cardiac output accompanied by variable effects on heart rate. The pulse rate effects are variable since, although the drugs tend to cause great acceleration, this may be changed to distinct slowing if the vagus reflex mechanism is sensitive. These circulatory actions are used in combating failure of the circulation from a variety of causes. During acute emergencies, as in accidents of anesthesia and in drowning, the injection of these drugs may result in the saving of life. The drugs useful for this purpose, besides epinephrine salts, are those with strong cardiovascular actions. Cobefrin hydrochloride,¹ neosynephrin hydrochloride, ephedrine sulfate or hydrochloride and propadrine hydrochloride are probably the best examples in the order named. When there has been a serious fall of blood pressure during spinal anesthesia, or to prevent such an accident, any of these drugs may be used, provided their duration of action and dosage is such as to meet the needs of the particular clinical condition. Ephedrine salts appear particularly useful for this purpose, since these have prolonged actions, although neosynephrin hydrochloride is also effective but of more transitory duration. The other members of this group have not been extensively enough used under such conditions to allow any opinion as to their relative merits. Surgical shock is rather poorly combated by any of these, except temporarily, and recourse must be had to other methods, such as restoring blood volume, which give more permanent results.

LOCAL ANESTHESIA

The vasoconstriction is also used to prolong local anesthesia. The synthetic substitutes for epinephrine

hydrochloride which have been tested in this connection are cobefrin hydrochloride and neosynephrin hydrochloride. A concentration of 1:10,000 cobefrin hydrochloride and 1:2,500 of neosynephrin hydrochloride is clinically equivalent to about 1:50,000 of epinephrine hydrochloride. Both are satisfactory, although they tend to permit somewhat more bleeding than the latter drug. Otherwise the differences between all three in local anesthetic solutions are too small to detect, except from comparisons of very extensive data, because the duration, intensity, speed of onset and other factors are very much alike. The salts of other sympathomimetic amines, such as amphetamine sulfate, propadrine hydrochloride and ephedrine sulfate or hydrochloride, have not been demonstrated to be of value for this purpose, probably because their vasoconstrictor power is inadequate.

DECONGESTIVE EFFECTS

Another vascular effect which is utilized clinically is the shrinkage of turgescient mucous membranes, as in rhinitis and other nasal conditions. All the compounds in this group shrink such mucosae with a clinically useful degree of efficiency. Epinephrine or its hydrochloride is not generally preferred for this purpose because it produces so much constriction that the resulting tissue anoxemia and the secondary active vasodilatation and irritation are apt to give rise to delayed local edema and swelling. The most popular compound has been ephedrine or its salts, which in concentrations of about 1 to 3 per cent produces moderately complete blanching of the nasal mucosa. An equal, if not greater, degree of constriction is produced by 0.25 per cent neosynephrin hydrochloride and by higher concentrations of amphetamine or propadrine hydrochloride. These nasal preparations are used in the form of aqueous or liquid petrolatum solutions, with or without the addition of aromatic principles, except the volatile amphetamine, which is dispensed in the form of an inhaler tube. The aromatized liquid preparations and the amphetamine vapors are frequently irritating and therefore should be used only in those conditions in which acute inflammation is not present. It seems unlikely from the clinical evidence that any of these compounds has a decisive advantage over the others in the degree of irritation which its aqueous solutions produce. Various special solutions of these agents are advocated, wherein the solvent has been buffered or made isotonic by the addition of physiologic solution of sodium chloride mixtures or dextrose. While these may be better theoretically than the more acid solutions which result when they are dissolved in physiologic solution of sodium chloride, any real advantage does not seem to have been adequately established by the clinical reports thus far available. Similarly, there seems to be no acceptable proof that the addition of antiseptic agents to these solutions is a beneficial modification.

MYDRIASIS

All these drugs dilate the pupil, so that they can be used as clinical mydriatics, particularly when combined with atropine or its derivatives. Although there are a number of favorable clinical reports of such uses, these drugs do not appear to have attained great popularity as mydriatics.

BRONCHII

Bronchial dilatation is produced in a dramatic way by epinephrine hydrochloride, but to a much lesser extent by the substitutes. Neosynephrin hydrochloride, ephedrine sulfate or hydrochloride and propadrine

From the Department of Pharmacology, Stanford University School of Medicine.

1. Cobefrin hydrochloride is the proprietary name for racemic 3,4-dihydroxy-phenyl-propanolamine hydrochloride, manufactured by the Winthrop Chemical Company. It does not stand accepted by the Council on Pharmacy and Chemistry.

hydrochloride are moderately effective for this purpose, although their action seems to be best in the milder cases of bronchospasm. The musculature of the gastrointestinal tract is generally relaxed by these compounds, but the effects seem to be produced only in doses which cause definite changes in the circulation. This fact therefore limits their clinical usefulness in gastrointestinal disorders. However, they have been used to advantage in facilitating radiologic examination, when spasm may complicate the interpretation of fluoroscopic examinations.

ABSORPTION AND FATE

The absorption of these drugs, when taken by mouth, is controlled by a number of physiologic factors. If the agent is a very effective vasoconstrictor, it limits its own absorption by reducing the blood flow through the mucosa of the gastrointestinal tract. If the compound is chemically unstable, it is destroyed by the digestive ferments or by the liver as the blood passes through it on its way to the general circulation. For this reason, oral effectiveness occurs mainly with those compounds which are chemically stable and which have lesser degrees of vasoconstrictor power. Ephedrine sulfate or hydrochloride, amphetamine sulfate and propadrine hydrochloride are rather effectively absorbed and therefore can be administered clinically in this way with fairly reliable effects. Neosynephrin hydrochloride also has some demonstrable potency by mouth, although the dose must be vastly increased over that which is effective by parenteral administration. Those compounds having a catechol nucleus, such as epinephrine hydrochloride, cobefrin hydrochloride and kephrine hydrochloride, are almost completely inactive by the oral route.

After absorption, the compounds with a phenolic or catechol nucleus, such as epinephrine hydrochloride, cobefrin hydrochloride, neosynephrin hydrochloride and kephrine hydrochloride, are mainly destroyed in the body. On the other hand, those compounds without the hydroxyl group on the benzene ring, such as ephedrine sulfate or hydrochloride, propadrine hydrochloride and amphetamine sulfate, apparently resist chemical change much more completely and can be identified in important amounts in the urine. Since the duration of action of these drugs is related to the ease with which the body can destroy or eliminate them, the actions of the former compounds tend to be of short duration, whereas those of the latter are prolonged, the exact duration being modified by the dose administered. Possibly because of this same difference in rate of elimination the compounds of the latter group tend to show tachyphylaxis; that is, they tend to have a sharply decreasing effect with successive doses, particularly when the administrations are made at short intervals.

TOXICITY

The toxicity of these drugs is produced through two major mechanisms. First, there is the stimulation of the circulation, which, if too much may give rise to acute cardiac dilatation with pulmonary edema, vascular accidents and other sequelae of acute hypertension. The other objectionable side effects are those resulting from central stimulation; that is, nervousness, general excitement, tremors and insomnia from direct irritation of the central nervous system. In hyperthyroid states the circulatory response to epinephrine is increased, so that

the dosage must be reduced if too strong a response is to be avoided. Whether the same increased sensitivity is seen with the other compounds is not certain. It is probable that the same caution should be used in patients with hypertension, since in them added cardiovascular strain may be dangerous. The cardiovascular toxicity is important mainly in the case of epinephrine, since, with the other agents, the doses required to produce such circulatory effects are considerably beyond any which are apt to be used in practice.

The margin of safety with respect to the stimulation of the circulatory system increases with the greater deviation from the epinephrine structure. Clinical observations on severe or fatal toxicity of these products for human beings is sparse, so that no accurate estimates can be made as to what the human fatal doses might be. However, animal experiments indicate fatal effects in the dose range of 10 to 50 mg. per kilogram or more. These quantities are high enough to indicate the wide margin existing between these amounts and the doses employed clinically. Because of this unusually high safety margin, claims for the superiority of one compound over another based on the cardiovascular toxicity have little significance.

CENTRAL EFFECTS

Stimulation of the central nervous system is apparently not dependent on the cardiovascular effects, since there is no correlation between potency for the circulation and that for central excitation. The most effective central stimulant is amphetamine sulfate, with ephedrine and epinephrine salts producing lesser effects in the order named. The amount of such action is minimal or completely lacking in any tolerated dose with neosynephrin hydrochloride and propadrine hydrochloride. There is a great difference in the potency of the optical isomers, the dextro-amphetamine being considerably more active than the levo form. Conversely, levoephedrine is a more potent excitant of the central nervous system than is its dextro derivative. In each case the racemic mixture is intermediate in action, as might be expected. These facts also emphasize the lack of agreement between cardiovascular actions and those on the brain, since the levo compounds are the more active circulatory drugs. Cobefrin hydrochloride produces central stimulation in patients comparable to that of epinephrine salts, although it is probably less effective in animals in doses which can be withstood by the cardiovascular system. The relative intensity of these central effects are extremely difficult to judge in human beings, because of the lack of efficient quantitative methods and because they are so frequently superimposed on psychic effects arising from operative or other procedures, or the disease state itself.

STYPTIC USES

Kephine hydrochloride, the base of which is the ketone precursor of epinephrine, has been used for many years in Europe under the name of adrenalone, for local application as a styptic. It would seem to have some merit for this purpose when applied locally in dusting powders or impregnated on gauze in packing oozing wounds. It has a low order of vasoconstrictor power which is unlikely to give rise to serious local anoxemia. The other agents might conceivably be used in the same way, although they have not been actively advocated for this general type of application, except perhaps during acute surgical emergencies.

UNSOLVED PROBLEMS

Problems which are attracting close attention at the moment relate to possible differential effects of these drugs and related agents on the circulation. These are concerned with preponderance of actions of some of these agents on the heart as compared to the peripheral vessels, or on the venous side of the circulation as compared to the arterial side. Such studies have not yet gone far enough to demonstrate clearly that the differences observed are not primarily the result of differences in the relative dosages tested. If it can be clearly demonstrated that certain of these agents have predominant actions on some part of the circulatory system, a means may be afforded for selecting more rationally the drug to be used under a given clinical condition of cardiovascular failure.

Attention is also being given to the possibility of drug addiction from the central stimulation of amphetamine and its sulfate. The effectiveness of amphetamine on the central nervous system is much greater than that of caffeine or the other common central stimulants and resembles qualitatively the actions of cocaine. Since amphetamine sulfate frequently causes euphoria or other pleasant symptoms and is used by the public as a "pep-up" drug to restore failing energy or to ward off the effects of fatigue, the conditions are present for establishing addiction. The profession may do well to remember that cocaine was used for centuries before its addiction properties were recognized, that heroin (diacetylmorphine hydrochloride) was used as a cure for addiction to morphine, and morphine for alcoholism, and that historically the recognition of addiction has always lagged considerably behind the introduction of the drug in question. Therefore, until the propensities of amphetamine and its sulfate in this connection are thoroughly understood and the dangers fully assessed, it would seem wise to use this agent only in those conditions in which a definite need for it has been demonstrated and the conditions tending to establish addiction are not present.

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATIONS.

OFFICE OF THE COUNCIL.

BACTERIAL VACCINE MADE FROM THE TYPHOID BACILLUS (See New and Nonofficial Remedies, 1940, p. 461):

The Upjohn Company, Kalamazoo, Mich.

Typhoid Vaccine.—A suspension made from a single strain, namely *Eberthella typhosa* strain 58 (the Panama carrier strain). Marketed in packages of six 2.5 cc. vials containing 1,000 million killed typhoid bacilli per cubic centimeter, suspended in physiologic solution of sodium chloride and preserved with 0.5 per cent phenol.

NICOTINIC ACID (See New and Nonofficial Remedies, 1940, p. 524).

The following dosage forms have been accepted:

Tablets Nicotinic Acid, 50 mg.
Prepared by Endo Products, Inc., Richmond Hill, N. Y.
Tablets Nicotinic Acid, 100 mg.
Prepared by Endo Products, Inc., Richmond Hill, N. Y.

SULFAPYRIDINE (See New and Nonofficial Remedies, 1940, p. 494).

The following product has been accepted:

Sulfapyridine-Smith-Dorsey.—A brand of sulfapyridine-N. N. R.

Distributed by the Smith-Dorsey Company, Lincoln, Neb. No U. S. patent or trademark.

Tablets Sulfapyridine-Smith-Dorsey, 0.5 Gm. (7.7 grains).

Council on Foods and Nutrition

ACCEPTED FOODS

THE FOLLOWING ADDITIONAL FOODS HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON FOODS OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO ACCEPTED FOODS.

FRANKLIN C. BING, Secretary.

PREPARATIONS USED IN THE FEEDING OF INFANTS, Fruits, Vegetables and other Preparations (See Accepted Foods, 1939, p. 185).

R. H. Macy & Company, New York.

Macy's Lily White Brand Chopped Beets.

Analysis (submitted by manufacturer).—Moisture 90.3%, total solids 9.7%, ash (including sodium chloride) 0.7%, sodium chloride 0.3%, fat (ether extract) 0.2%, protein (N \times 6.25) 0.7%, crude fiber 0.6%, carbohydrates other than crude fiber 7.5%, calcium (Ca) 0.022%, phosphorus (P) 0.014%, iron (Fe) 0.0010%, manganese (Mn) 0.0005%, copper (Cu) 0.00006%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 16.1.

Calories.—0.35 per gram; 9.9 per ounce.

Macy's Lily White Brand Chopped Carrots.

Analysis (submitted by manufacturer).—Moisture 93.7%, total solids 6.3%, ash (including sodium chloride) 0.6%, sodium chloride 0.2%, fat (ether extract) 0.4%, protein (N \times 6.25) 0.5%, crude fiber 0.6%, carbohydrates other than crude fiber 4.2%, calcium (Ca) 0.029%, phosphorus (P) 0.023%, iron (Fe) 0.0008%, manganese (Mn) 0.0004%, copper (Cu) 0.00004%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 15.3.

Calories.—0.22 per gram; 6.2 per ounce.

Macy's Lily White Brand Chopped Green Beans.

Analysis (submitted by manufacturer).—Moisture 93.0%, total solids 7.0%, ash (including sodium chloride) 0.7%, sodium chloride 0.3%, fat (ether extract) 0.7%, protein (N \times 6.25) 1.1%, crude fiber 0.8%, carbohydrates other than crude fiber 3.7%, calcium (Ca) 0.029%, phosphorus (P) 0.041%, iron (Fe) 0.0010%, manganese (Mn) 0.0002%, copper (Cu) 0.00010%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 15.4.

Calories.—0.26 per gram; 7.8 per ounce.

Macy's Lily White Brand Chopped Spinach.

Analysis (submitted by manufacturer).—Moisture 94.4%, total solids 5.6%, ash (including sodium chloride) 1.4%, sodium chloride 0.7%, fat (ether extract) 0.5%, protein (N \times 6.25) 1.1%, crude fiber 0.8%, carbohydrates other than crude fiber 1.8%, calcium (Ca) 0.140%, phosphorus (P) 0.020%, iron (Fe) 0.0030%, manganese (Mn) 0.0006%, copper (Cu) 0.00012%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 18.1.

Calories.—0.16 per gram; 4.54 per ounce.

Macy's Lily White Brand Chopped Prunes.

Analysis (submitted by manufacturer).—Moisture 71.5%, total solids 28.5%, ash (including sodium chloride) 0.7%, sodium chloride 0.02%, fat (ether extract) 1.9%, protein (N \times 6.25) 0.7%, crude fiber 0.6%, carbohydrates other than crude fiber 24.6%, calcium (Ca) 0.024%, phosphorus (P) 0.030%, iron (Fe) 0.0025%, manganese (Mn) 0.0002%, copper (Cu) 0.00033%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 13.7.

Calories.—1.18 per gram; 33.5 per ounce.

Macy's Lily White Brand Chopped Liver Soup with Vegetables and Cereal, canned chopped mixture of fresh beef livers, tomato juice, potatoes, carrots, unpolished rice, water, whole grain barley, celery, cabbage, barley flour, rice flour and salt.

Analysis (submitted by manufacturer).—Moisture 85.4%, total solids 14.6%, ash (including sodium chloride) 1.6%, sodium chloride 1.1%, fat (ether extract) 0.4%, protein (N \times 6.25) 2.9%, crude fiber 0.3%, carbohydrates other than crude fiber 9.4%, calcium (Ca) 0.011%, phosphorus (P) 0.060%, iron (Fe) 0.0008%, manganese (Mn) 0.0003%, copper (Cu) 0.00047%, alkalinity number of salt-free ash (cc. N/1 HCl per gram ash) 8.8.

Calories.—0.53 per gram; 15.1 per ounce.

Macy's Lily White Brand Chopped Vegetable Soup with Beef Broth and Cereal, canned chopped mixture of tomato juice, beef broth, potatoes, carrots, unpolished rice, whole grain barley, celery, water, barley flour, rice flour, cabbage, salt and spinach.

Analysis (submitted by manufacturer).—Moisture 85.8%, total solids 14.2%, ash (including sodium chloride) 1.6%, sodium chloride 1.2%, fat (ether extract) 0.3%, protein (N \times 6.25) 1.5%, crude fiber 0.3%, carbohydrates other than crude fiber 10.5%, calcium (Ca) 0.014%, phosphorus (P) 0.033%, iron (Fe) 0.0015%, manganese (Mn) 0.0003%, copper (Cu) 0.00012%, alkalinity number of salt-free ash (cc. Subscription price - - - : Eight dollars per annum in advance

Please send in promptly notice of change of address, giving both old and new; always state whether the change is temporary or permanent. Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, JUNE 21, 1941

STRIKES IN HOSPITALS

Recently Pittsburgh and Allegheny County in Pennsylvania have been subjected to an extraordinary manifestation in medical affairs: a strike among hospital workers associated with Local Union No. 255 of the State, County and Municipal Workers of America, affiliated with the Congress of Industrial Organizations. Activities included picketing, demonstrations, interference with the removal of patients who wanted to use taxicabs, and interference with the receipt of food and the removal of garbage. In a strike called at the West Penn Hospital on April 18, maids, orderlies and employees in the nurses' home, in the engineering division and in the garages were called out; there were threats of violence, actual violence and establishing of picket lines. The window of an ambulance leaving the hospital was smashed and, altogether, a serious situation was created affecting the lives and health of all the patients in the hospital. On April 19 a court of Allegheny County granted an injunction restraining the defendant and its members from interfering with, hindering or obstructing the conduct and operation of the West Penn Hospital. Previously THE JOURNAL has referred to a decision by the Supreme Court of the State of Pennsylvania, which said on Jan. 6, 1941:

A hospital is not an industry. It has not been the custom in the past to unionize hospitals. The effect of unionization and attendant efforts to enforce demands would involve results far more sweeping and drastic than mere property rights.

The questions of profits for the employer or wages for the employees are not alone involved. It is not merely a matter of suspending operations, ceasing work and stopping production, such as might be true in a steel mill or automobile factory. It is a question of protecting the health, safety and, in many cases, the very lives of those persons who need the service a hospital is organized to render.

Our government, through the President, has used the United States Army to put into operation an industry conceived to be necessary in the national defense emergency. The patients in a hospital are there in almost every instance because of conditions which constitute an emergency of another kind. Many of them

are recovering from surgical operations; some of them are mothers who have given birth recently to children or who are about to give birth to children; some of them are little children who are being treated for serious conditions, including infectious diseases. The Supreme Court of the State of Pennsylvania was well advised when it said "a hospital is not an industry" and when it intimated that the use of the strike to enforce demands would involve "results far more sweeping and drastic than mere property rights." Recently a member in Congress arose to inquire why the violators of the law in the state of Pennsylvania were not prosecuted by the proper authorities of that state. Certainly here is a situation in which every power that the state possesses should be applied to protect the thousands of patients in the hospitals of Pittsburgh. Can it be that the state authorities are unwilling or incompetent to give these sick the protection that is their right?

Every one of the hospitals concerned is a nonprofit, public, charitable corporation. Not one of these hospitals is engaged in any trade or business, regardless of the point of view that has occasionally been expressed by some government officials. The concept that medicine is a trade and that the work of the hospital is a business is certain to lead to exactly the type of abuse which has developed in the state of Pennsylvania. Inevitably it will break down the morals and standards which have been applied to the care of the sick since time immemorial. In every religion held sacred by man the care of the sick is held to be a spiritual task. The type of savagery that permits leaders of labor to carry coercive techniques into the work of the hospital may involve a responsibility that reaches high in the government not only of the state of Pennsylvania but also of the United States.

IRRADIATED ANTIVIRAL VACCINES

Recently Salk and his co-workers¹ of the Department of Bacteriology, New York University College of Medicine, have claimed that by proper adjustment of distance, intensity and length of exposure to ultraviolet radiation a nonviable influenza vaccine may be prepared which has proved to be a fully effective prophylactic agent for laboratory animals.

Following the discovery of ultramicroscopic viruses it was hoped that, by the use of heat-killed viruses or of viruses inactivated by chemical antiseptics, prophylactic vaccines might be prepared that would be effective against all virus diseases. Soon it became evident, however, that physically or chemically inactivated viruses are usually so altered in their biochemical properties as to be practically useless as immunizing agents. Applying newer methods of antigenic titration, for example, Webster and Casals² found that of forty-one commer-

1. Salk, J. E.; Lavin, G. I., and Francis, Thomas, Jr.: *J. Exper. Med.* **72**: 729 (Dec.) 1940.

2. Webster, Leslie T.: *J. Exper. Med.* **70**: 87 (July) 1939. Webster, L. T., and Casals, J.: *J. Exper. Med.* **71**: 719 (May) 1940.

cially available phenolized or chloroformed antirabic vaccines only eleven were of predictable clinical value; indeed, 75 per cent of their chemically inactivated viruses were without demonstrable immunizing power for mice. Tested on dogs, 50 per cent of the commercially available chloroformized vaccines were without demonstrable value. Over 90 per cent of the phenolized vaccines were antigenically inert. These percentages were recorded not only with vaccines prepared by nine different commercial firms but with different batches prepared by the same firm.

Because of evident difficulties in preparing chemically inactivated vaccines of predictable clinical value, the Rockefeller Institute bacteriologists³ turned to the possibility of the successful preparation of nonviable antiviral vaccines by the use of ultraviolet radiation. When a rabies virus, for example, is exposed to a mercury vapor lamp under arbitrary standard conditions its virulence is gradually decreased, and it becomes completely noninfectious for mice by the end of about forty-five minutes. Mice repeatedly injected intraperitoneally with such nonviable irradiated vaccines usually acquire a specific immunity sufficient to resist a subsequent intracerebral injection of from 100 to 1,000 minimum lethal doses of the homologous living virus. This is in the neighborhood of ten times the average immunizing potency of the best chloroformized antirabic vaccine now available on the American market and nearly five hundred times the average immunizing potency of available phenolized vaccines.

Encouraged by these results, Salk and his co-workers applied a similar technic to the preparation of nonviable influenza vaccines. Two highly virulent strains of the virus of epidemic influenza were studied by the New York investigators; both viruses usually gave fatal infections in mice on the intranasal instillation of 0.05 cc. of a 1:10,000,000 dilution of the standard suspension. They found that the mouse infectivity of each influenza strain is completely destroyed after from nine to thirty minutes' exposure to a mercury vapor lamp. The immunity induced in mice by relatively large doses of this irradiated vaccine was practically the same as the maximum immunity resulting from sublethal infections. Quantitative titrations, however, afterward showed that this optimum is attained only with massive doses of the vaccine. Tested in minimum or threshold concentrations the irradiated vaccines were only about 1 per cent as effective as the same dose of the living virus. This discrepancy conceivably might be explained on the assumption that the living virus multiplies a hundred fold in the injected tissue before being inhibited by the immunizing process.

These encouraging results have stimulated a study of the possible application of the irradiation technics to the

preparation of nonviable poliomyelitis vaccine and to the specific prophylaxis of yellow fever. The antigenic potency of the new irradiated influenza vaccines, however, has not yet been tested on man.

CONSERVATION OF MAN POWER IN CONNECTICUT

Two important elements must be considered in any plan for widespread extension of preventive industrial medicine and surgery to factories, mines, mercantile establishments and other industrial classifications. One is the creation of a demand for such service by plants of all types and sizes, and the other is assurance of ready availability of trained personnel competent to carry out the objectives of industrial health. Much carefully planned educational effort is needed both for physicians and for industrialists. Recent practical experience suggests that at least in the initial stages these two groups may be instructed together. Evidently by such practice each is likely to gain a better appreciation of the part the other must play if any appreciable results are to occur in the reduction of lost-time disability on a basis which the average employer can and will support. The National Association of Manufacturers recently sponsored a series of industrial health clinics in a number of typical industrial communities in which both physicians and employers participated and wherein both were instructed about the dividends to be realized in health and in economic advantage under a system of industrial health supervision. Following this general pattern, the Saginaw County Medical Society in Michigan undertook a similar successful conference on its own initiative, a procedure which can be recommended for adoption by the profession in other industrial centers.

These earlier activities have been followed by an even more encouraging series of developments in Connecticut, one of the country's foremost manufacturing centers. A program of helpful cooperation has been instituted between committees on industrial health in the state medical society and the manufacturers' association of Connecticut. Both committees have felt that, in relation to the current defense effort, extension and improvement of industrial mediums is both an opportunity and an obligation. A pamphlet has been prepared and issued by these two organizations directed at physician and employer alike as a first step in broadening acquaintance with the objectives and technics of industrial medical service. In effect, every plant manager in the state is invited to discuss with this joint committee the health problems of his plant and to discover through this method the most effective solution. Accessibility to a consulting service of this character, backed by such influential organizations, is a most reassuring development and a long step toward supplying small plants with needed industrial health control. An expectable effect should be the creation of a much wider demand for competent industrial medical service based on ade-

3. Hodess, H. L.; Webster, L. T., and Lavin, G. I.: *J. Exper. Med.* 72: 437 (Oct.) 1940.

quate standards, ethically and scientifically. The Committee on Industrial Health in the Connecticut State Medical Society has already taken steps to see that physicians in that area will be in position to respond to these demands.

This example of civic and professional leadership is a proper function of the organized medical profession and a far reaching experiment in public relations. It deserves emulation by medical societies everywhere.

Current Comment

ANTI-GRAY HAIR VITAMIN DEFICIENCY IN FOXES

Whether or not the fox is especially susceptible to vitamin deficiency diseases may well be subject to investigation. In any event, one vitamin deficiency in these animals, called Chastek paralysis, has already been referred to in *THE JOURNAL*.¹ Perhaps these animals are particularly susceptible to deficiency of thiamine, for now Morgan and Simms² report observations on 6 young silver foxes, 3 of them placed on a purified diet supplemented by fish liver oil, wheat germ, riboflavin and nicotinic acid, and 3 others receiving the same diet with the addition of a yeast "filtrate factor." Of the first group, 1 died after twenty-six days and the other 2 lost most of their fur. At necropsy the fox that died and the other 2 on deficient diet, pelted four months later, showed large red mottled thymuses. The 3 foxes which received the filtrate factor retained their fur, had no surviving thymuses and had normal dark silver pelts. These observations tend to confirm previous facts noted in rats and dogs and suggest that there is a specific vitamin fraction in the B group which may be called, for the present, the anti-gray hair vitamin of foxes. No doubt the possible implication to gray hair in man will result in follow-up studies in the near future on this interesting deficiency disease in foxes.

ENSOL IN THE NEWS

THE JOURNAL has previously commented¹ on "Ensol," a preparation advocated for cancer by Dr. Hendry C. Connell of Kingston, Ont. It was pointed out that the results claimed by the promulgator were not dissimilar to those obtained with several other methods, e. g. by Coley's fluid, by various bacterial toxins, by injection of Witte's peptone or a number of similar foreign proteins. In 1935 *THE JOURNAL* warned that grief would inevitably result from the promotion of this uncontrolled product. Three years later eleven deaths were reported in Orlando, Fla., following the use of Rex, series 152—a form of Ensol which had been contaminated with tetanus organisms. Recently the Ontario Commission for the Investigation of Cancer

Remedies made an equivocal report on the product and thereby stimulated renewed publicity. Newspaper reports seem to suggest that Ensol has been "approved" by the commission.² Because of inquiries received at the American Medical Association, a letter was sent by air mail to the commission in care of one of its members asking if the commission had issued the statements suggested. Although a month has elapsed since the mailing of this letter a reply has not yet been received. In 1935 the newspapers described Ensol as a "cancer cure"; now it is stated by Dr. Connell and the commission that they do not consider Ensol to be a "cure" but that benefit is sometimes derived from its administration. A brief comment in a recent issue of the *Canadian Medical Association Journal*³ offers a more conservative attitude than is obtained by reading other journals but indicates that the commission grants Ensol has "produced beneficial results in a fairly large percentage of patients suffering from cancer." Fortunately the commission suggests that it is too early to vindicate the acceptance of Ensol in preference to other recognized procedures. Apparently the Canadian commission has "damned with faint praise." Nevertheless some patients with cancer in a stage which might be controlled by standard technic may demand the use of this doubtful product to the exclusion of more generally accepted procedures.

PRESCRIPTIONS

When the new Federal Food, Drug and Cosmetic Act was enacted, many doubted its effectiveness. Similar consideration was given to the Wheeler-Lea Amendment to the Federal Trade Commission Act, which became a law at about the same time. Now some figures have become available which seem to indicate clearly that such legislation is having a desirable effect. The *American Journal of Pharmacy* for January 1941 contains an item under the title "The Nation Takes Its Medicine," noting that prescription drugs and medicines showed an increase of \$36,000,000 for 1939 over 1937 and that "patent" and proprietary medicines for public sale decreased \$18,000,000 in value in the same period. The actual value of the prescription medicines in 1939 was \$178,930,487. The value of "over the counter" medicines in that year was \$166,577,263. Obviously, therefore, the permissible claims for "patent medicines" today are so restricted as to reduce their sale to the public, or the public is becoming better informed as to the advantages of employing ethical remedies and prescribed remedies. The *Drug and Cosmetic Industry* for December 1940 provides an analysis in its story "Ethicals Take Lead." Apparently vitamins showed the greatest gain, glandular preparations also advanced, and the use of biologic preparations was adversely affected by the popularity of sulfanilamide in infectious conditions. Education is making the public aware of the advantage of using ethical remedies and prescribed remedies. If, by action of the various federal agencies, the sales of "patent medicines" continue to decrease, a new day will dawn for the health of the American people. The health of the nation is an integral part of national defense.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY

The following additional medical reserve corps officers have been ordered to extended active duty by the War Department, Washington, D. C.:

ALPERN, Algernon Nathan, 1st Lieut., Pittsburgh.
BASS, John Burrell, 1st Lieut., Gadsden, Ala.
BAYON, Henry Joseph, Jr., Captain, New Orleans.
CALVERT, Hulin Elwin, Major, San Antonio, Texas.
CAPPELLER, William S., 1st Lieut., San Francisco.
CARDEY, Norman LeRoy, 1st Lieut., Winona, W. Va.
CASAMAS, Lawrence Vito, 1st Lieut., Brooklyn.
CHAPIN, Willard James, 1st Lieut., Perry, N. Y.
FOX, William Morgan, 1st Lieut., Columbia, S. C.
GLECKLER, John David, Major, San Antonio, Texas.
GOSS, Walter Alling, Jr., 1st Lieut., Chicago.
GRANT, Ben Ely, Major, Hollywood, Calif.
GRIFFIN, Ernest Pierce, Jr., 1st Lieut., Valhalla, N. Y.
HARMAN, Glen S., 1st Lieut., Santa Barbara, Calif.
HAWLEY, Carl John, 1st Lieut., Los Angeles.
HAYES, Dean M., 1st Lieut., Washington, D. C.
HEYER, Howard Eugene, 1st Lieut., Chicago.

WAR DEPARTMENT

HILL, Thurman Knight, 1st Lieut., Decatur, Ga.
INDERLIED, Herman Frederick, 1st Lieut., Portland, Ore.
INGALLS, George Samuel, 1st Lieut., Towson, Md.
IPPOLITO, Thomas Leonard, 1st Lieut., Glendale, L. I., N. Y.
JOEL, Samuel W., 1st Lieut., Washington, D. C.
JORDAN, Paul Hartley, 1st Lieut., Ann Arbor, Mich.
KANTHAK, Frank Folbert, 1st Lieut., Chicago.
KATZ, Harry Leon, 1st Lieut., Cleveland.
LEIGH, Cortland Dyal, 1st Lieut., Pittsburgh.
MARCH, Harry Nelson, Captain, Grass Valley, Calif.
MARSHAK, Richard H., 1st Lieut., New York.
MARSHALL, Frank Anton, Major, Weehawken, N. J.
MILLER, Cecil Ewing, 1st Lieut., Washington, D. C.
NORTON, William Ignatius, 1st Lieut., Oakland, Calif.
PRUCE, Arthur Marcel, 1st Lieut., Brooklyn.
RIEDEL, Henry Frank, 1st Lieut., Portland, Ore.
SCHOPP, Alvin C., 1st Lieut., Shreveport, La.
SULY, Charles William, Jr., 1st Lieut., New Milford, Pa.
TUNICK, Arthur Mandel, 1st Lieut., Phoenix, Ariz.
TYLER, Gilman Rackley, 1st Lieut., Richmond, Va.
ZIMMERMAN, Richard P., 1st Lieut., Holsopple, Pa.

FIRST CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, First Corps Area, which comprises the states of Maine, Vermont, New Hampshire, Rhode Island, Massachusetts and Connecticut:

ANDERSON, Justin L., 1st Lieut., Reading, Mass., Fort Oglethorpe, Ga.
BISHOP, Ernest W., 1st Lieut., East Providence, R. I., Fort Oglethorpe, Ga.
BREM, Jacob, Captain, Worcester, Mass., Maxwell Field, Ala.
CALCAGNI, Oscar H., 1st Lieut., Morrisville, Vt., Fort Barrancas, Fla.
FARRELL, Malcolm J., Captain, Waverley, Mass., Fort Devens, Mass.

THIRD CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Third Corps Area, which comprises the states of Pennsylvania, Virginia, District of Columbia and Maryland:

AYERILL, Roy Samuel, 1st Lieut., Pittsburgh, Fort George G. Meade, Md.
BARNHARDT, Russell Arthur, 1st Lieut., Pittsburgh, Carlisle Barracks, Pa.
BASTIEN, Henry Louis, Captain, Arlington, Va., Fort Belvoir, Va.
BUCKLAND, Wilmer Brundage, 1st Lieut., Philadelphia, Fort Eustis, Va.
COOPER, George, Jr., 1st Lieut., University, Va., Fort Eustis, Va.
DEAN, James Seay, Captain, Pennhurst, Pa., Fort Eustis, Va.
DUNKELBERGER, John Alfred, 1st Lieut., Philadelphia, Fort Bragg, N. C.
FERGUSON, Richard Butler, 1st Lieut., Baltimore, Fort Eustis, Va.
GABRIEL, Louis Thomas, Jr., 1st Lieut., Eldred, Pa., Fort Myer, Va.
HARTZ, William, Major, Philadelphia, Fort Belvoir, Va.

NINTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Ninth Corps Area, which comprises the states of Washington, Montana, Oregon, Nevada, Utah, California and Idaho:

ADAMS, Julius G., 1st Lieut., Friday Harbor, Wash., 56th Medical Battalion, Fort Lewis, Wash.
ANDLER, Maxwell M., 1st Lieut., Los Angeles, First Medical Regiment, Fort Ord, Calif.
BARNES, Myron C., 1st Lieut., Ontario, Calif., 3d Army Corps, Presidio of Monterey, Calif.
BARSHOP, Nathan, Captain, Los Angeles, Fort Rosecrans, Calif.
BOSSERT, Robert H., 1st Lieut., Burbank, Calif., Camp Roberts, Calif.
BRENNAN, John J., 1st Lieut., San Francisco, Camp Roberts, Calif.
BROCKBANK, Mark J., 1st Lieut., Price, Ida., 41st Division, Camp Murray, Wash.
CHERRY, Clifford R., 1st Lieut., Los Angeles, 3d Army Corps, Presidio of Monterey, Calif.
DAMRON, Milton H., Captain, M. R. C., Huntington, Park, Calif., Camp Seeley, Calif.
DOUGLAS, Wallace S., Captain, Lewiston, Ida., Fort Worden, Wash.
GUARDINO, Salvador J., 1st Lieut., M. R. C., Brisbane, Calif., Station Hospital Fort Lewis, Wash.
GUMMESS, Glen H., 1st Lieut., Los Angeles, Camp Roberts, Station Roberts, Calif.
GUTEKUNST, Frederic W., 1st Lieut., San Bernardino, Calif., Camp Hansen, Oscar J., 1st Lieut., Redding, Calif., 41st Division, Camp Murray, Wash.

HASLINGER, Joseph F., 1st Lieut., Portland, Ore., Station Hospital, Fort Lewis, Wash.
 HAWKINS, Ralph L., Captain, San Francisco, Station Hospital, Fort Lewis, Wash.
 HEIN, Walter F., Captain, Williams, Ariz., Moffett Field, Calif.
 HOLT, C. Zeno, Colonel, Los Angeles, Reserve Officers Training Corps, University of California, San Francisco.
 JAEKLE, Russell F., Captain, San Francisco, Camp Roberts, Calif.
 KARLEEN, Philip E., Captain, M. R. C., Soquel, Calif., 7th Division, Fort Ord, Calif.
 KIRCHDOERFER, Herman, 1st Lieut., Pasadena, Calif., Camp Roberts, Calif.
 LING, Louis A., Captain, Deer Park, Wash., Northwest Air District, Fort George Wright, Wash.
 MITCHELSON, David D. S., 1st Lieut., Los Angeles, Camp Roberts, Calif.
 MONSERATE, Domingo N., Major, Helena, Mont., Camp San Luis Obispo, Calif.
 NOALL, Wendell, 1st Lieut., Ogden, Utah, 41st Division, Camp Murray, Wash.
 PAWLEY, Ralph E., 1st Lieut., Indio, Calif., Camp Callan, Calif.
 PERELSON, Harold N., 1st Lieut., Huntington Park, Calif., Camp Callan, Calif.

PEREZ, Eugene R., 1st Lieut., San Francisco, Camp Roberts, Calif.
 PROFFITT, Josiah C., Captain, Seattle, Station Hospital, Fort Lewis, Wash.
 RICHARDS, Ezra E., 1st Lieut., M. R. C., Burlingame, Calif., 7th Division, Fort Ord, Calif.
 ROSE, William D., 1st Lieut., M. R. C., San Francisco, Camp Roberts, Calif.
 ROVANE, John W., 1st Lieut., M. R. C., Foodland, Calif., Camp Roberts, Calif.
 SASLAW, Lewis B., Captain, Stockton, Calif., Camp Roberts, Calif.
 SELIGMAN, Lewis L., Captain, Dinuba, Calif., Fort Lewis, Wash., duty with Medical Service Troops.
 SORENSON, Edward J., 1st Lieut., Beverly Hills, Calif., Corps Area Service Command, Fort Ord, Calif.
 STUPPY, Laurence J., 1st Lieut., Hollywood, Calif., Southern California Recruiting District, Los Angeles.
 SULLIVAN, James M., Major, San Francisco, Camp Roberts, Calif.
 WALL, Edward C., 1st Lieut., Prineville, Ore., 155th Station Hospital, Camp Roberts, Calif.
 WESSELL, Maurice S., Captain, Hamilton, Mont., Fort Worden, Wash.
 WESTERHOUT, Charles E., Captain, Brea, Calif., 3d Army Corps, Presidio of Monterey, Calif.

ORDERED TO FOREIGN DUTY

BURNETT, Thomas Raynes, Major, Mission, Texas, Dutch Harbor, Alaska.
 BYARS, Perry J. C., Jr., 1st Lieut., M. R. C., Lampasas, Texas, to Schofield Barracks, Honolulu, Hawaii.
 EISNER, David George, 1st Lieut., M. R. C., Cleveland, to Station Hospital, Fort Buchanan, San Juan, Puerto Rico.
 EPERJESSY, Ernest Zoltan, 1st Lieut., Johnstown, Pa., Fort Amador, Balboa, Canal Zone.
 KENNEDY, Richard Loren, 1st Lieut., West Lafayette, Ind., Ponce Air Base, Ponce, Puerto Rico.
 KNESE, Luke Ambrose, Captain, M. R. C., Billings, Mont., to Tripler General Hospital, Honolulu, Hawaii.
 KOSTECKI, Walter Andrew, 1st Lieut., South Hanson, Mass., Sternberg General Hospital, Manila, Philippine Islands.
 LEASUM, Charles, 1st Lieut., Sturgeon Bay, Wis., 12th Medical Regiment, Fort William McKinley, Philippine Islands.

LITTER, Leo, 1st Lieut., M. R. C., New York, to Station Hospital, Fort Buchanan, San Juan, Puerto Rico.
 MILLER, Edward Simpson, 1st Lieut., M. R. C., Murphy, N. C., to Philippine Department, Fort Santiago, Manila, Philippine Islands.
 PAUL, William Gordon, 1st Lieut., M. R. C., Durant, Okla., to Station Hospital, Fort Richardson, Anchorage, Alaska.
 RNINGER, Harold Casper, 1st Lieut., Rockport, Ind., Station Hospital, Fort Clayton, Canal Zone.
 SANJURJO RAMIREZ, Luis Arturo, 1st Lieut., M. R. C., San Juan, Puerto Rico, to Station Hospital, San Juan, Puerto Rico.
 SCHAUMLOFFEL, Roland Abraham, 1st Lieut., M. R. C., Los Angeles, to Ketchikan, Alaska.
 STERN, Siegfried, 1st Lieut., M. R. C., New Rochelle, N. Y., to Borinquen Field, Puerto Rico.
 STRAND, Clarence Johnson, Captain, M. R. C., Amherst, Neb., to Sternberg General Hospital, Manila, Philippine Islands.

SENIOR AND JUNIOR STUDENTS MAY BE COMMISSIONED IN ADMINISTRATIVE CORPS

The War Department has granted authority for male junior and senior medical students in grade A medical schools in the United States to be commissioned second lieutenants in the Medical Administrative Corps Reserve after July 1. Interns may be commissioned first lieutenants in the medical corps reserve with the understanding that they will be ordered to a year's active duty immediately after completing their internships. The granting of commissions to junior and senior students will exempt them from selective training and service and permit them to complete their medical education which might otherwise be interrupted; likewise, interns will be relieved of the possible interruption of their training. Students and interns who are properly qualified will be invited to submit applications for appointment, final approval in each case to be made by the War Department. Further instructions regarding the procedure to be followed will shortly be published.

GENERAL LOVE TO RETIRE

The War Department today announced that Brig. Gen. Albert G. Love, M. C., on duty in Washington, D. C., as assistant to the Surgeon General, would retire from active service on July 31 on account of reaching the statutory retirement age. His temporary appointment as brigadier general will be terminated on July 16, at which time he will revert to his permanent rank of colonel.

General Love was born in Trezevant, Tenn., and graduated from the University of Mississippi. He received his medical degree from the Memphis Hospital Medical College in 1904 and served a year as an intern in the U. S. Public Health Service. He then served as a contract surgeon in the United States Army from 1905 to 1906, after which he was appointed a first lieutenant in the medical corps of the regular army.

Prior to the World War General Love served as surgeon at various points in the United States, the Philippine Islands and Alaska. During and subsequent to the World War he was

head of the Statistical Division in the Office of the Surgeon General, Washington, D. C. He prepared a medical history of the World War and published detailed statistical studies of war casualties. Since 1938 he has been chief of the Planning and Training Division in the Office of the Surgeon General.

GRADUATION OF STUDENT OFFICERS AT CARLISLE BARRACKS

Another class of 538 student officers of the various corps of the medical department of the army, including members of the Regular Army, the National Guard and the Reserves, graduated May 29 at the Medical Field Service School at Carlisle Barracks and were ordered returned to their various units throughout the country. This was the fifth refresher class of student officers to graduate recently at this school following a course which has been necessarily shortened because of the present emergency. General Addison B. Davis, who has recently been made assistant to the surgeon general, in presenting the diplomas to the graduates pointed out that the demand for trained medical department officers is urgent and is increasing in magnitude.

PROMOTION OF COLONELS DAVIS AND McAFEE

President Roosevelt has nominated Col. Addison D. Davis, M. C., to be assistant to the Surgeon General for four years, with rank of brigadier general, vice Brig. Gen. Roger Brooke, and Col. Larry B. McAfee, M. C., to be assistant to the Surgeon General for four years, with rank of brigadier general, vice Brig. Gen. Raymond F. Metcalfe.

NEW GARMENTS FOR PATIENTS

A maroon colored garment for patients in army hospitals has been approved, it is reported, replacing the former drab garments. In addition to the more cheerful aspect, the new garments are handy for the patients while they are convalescing, as there are no buttons on the robes and they have side pockets to carry personal items.

ORGANIZATION SECTION

PROCEEDINGS OF THE CLEVELAND SESSION

MINUTES OF THE NINETY-SECOND ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CLEVELAND, JUNE 2-6, 1941

HOUSE OF DELEGATES

Second Meeting—Tuesday Morning, June 3

The House of Delegates was called to order at 9:45 a. m. by the Speaker, Dr. H. H. Shoulders.

Roll Call

On motion of Dr. Arthur T. McCormack, Kentucky, seconded by Dr. Walter E. Vest, West Virginia, and carried, the House dispensed with the roll call.

Presentation of Minutes

Dr. Arthur T. McCormack, Kentucky, moved that the House dispense with the reading of the minutes. The motion was seconded by Dr. John Z. Brown, Utah, and carried.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, reported that one hundred and sixty-four delegates had registered and been seated. He asked approval of the House of Delegates for the action of the reference committee in seating the assistant secretary of the Rhode Island Medical Society in the absence of the regularly elected delegate and alternate, and in seating a delegate designated by the president of the South Carolina Medical Association because of the absence of a regularly elected delegate of that association and his regularly elected alternate.

On motion of Dr. Edward M. Pallette, California, seconded by Drs. Arthur J. Bedell, Section on Ophthalmology, and Arthur T. McCormack, Kentucky, and carried, the House approved of the action of the reference committee in seating the assistant secretary of the Rhode Island Medical Society.

The action of the reference committee in seating the one designated by the president of the South Carolina Medical Association was approved on motion of Dr. E. G. Wood, Tennessee, seconded by Dr. Walter E. Vest, West Virginia, and carried after discussion by Drs. Arthur T. McCormack, Kentucky, and Olin West, Secretary.

Report of Committee on Medical Preparedness

Dr. Irvin Abell, Chairman, presented the following report, which was referred to the Reference Committee on Executive Session:

REPORT OF THE COMMITTEE ON MEDICAL PREPAREDNESS
To the Members of the House of Delegates of the American Medical Association:

At the annual session of the American Medical Association held in New York, June 10 to 14, 1940 the Board of Trustees submitted to the House of Delegates at its first meeting on June 10 resolutions providing for the appointment of a Committee on Medical Preparedness which, when created, should "establish and maintain contact and suitable relationship with all governmental agencies concerned with the prevention of disease and the care of the sick, in both civil and military aspects, so as to make available at the earliest possible moment every facility that the American Medical Association can offer for the health and safety of the American people and the maintenance of American democracy." At the same meeting of the House of Delegates, Lieut. Col. George C. Dunham, member of the House representing the Medical Corps of the United States Army, submitted a "tentative plan for the pro-

curement of professional personnel for the Medical Corps of the Army in the event of a national emergency."

The resolutions of the Board of Trustees and the statement submitted by Colonel Dunham were referred to the Reference Committee on Executive Session. The reference committee reported to the House of Delegates in executive session on Tuesday, June 11, and recommended that the resolutions submitted by the Board of Trustees be amended to include the Chairman of the Board as a member ex officio of the proposed Committee on Medical Preparedness, and that the Committee should be appointed by the Speaker of the House. The resolutions with the amendments offered were adopted by the House of Delegates. At a later meeting of the House of Delegates the Reference Committee on Executive Session presented a second report in which it was recommended that the Committee on Medical Preparedness be composed of ten members of the House of Delegates with the President of the Association, the Chairman of the Board of Trustees, the Secretary of the Association, the Secretary of the Board of Trustees and the Editor of THE JOURNAL as members ex officio. The recommendations of the reference committee were adopted by the House, and the Committee on Medical Preparedness was duly appointed on June 13, 1940.

MEETINGS OF THE COMMITTEE

The first meeting of the Committee was held immediately after adjournment of the House of Delegates on June 13, 1940. Other meetings were held July 19, Sept. 20 and Nov. 23, 1940 and Feb. 15, 1941. At these meetings the Medical Corps of the United States Army, the Medical Corps of the United States Navy and the United States Public Health Service have been officially represented, and the representatives of these government services have been most gracious and generous in extending aid to the Committee. The Selective Service System was represented at two meetings by Lieut. Col. Charles B. Spruit, who offered information and counsel of the most helpful nature. At the meeting held on Feb. 15, 1941 the members of the Subcommittee on Medical Education of the Health and Medical Committee of the Federal Security Agency were present, as were members of the Council on Medical Education and Hospitals.

CONFERENCE ON MEDICAL PREPAREDNESS

On Sept. 20, 1940 a conference was held under the auspices of this committee at the Association's offices in Chicago. This conference was attended by the state chairmen of the Committee on Medical Preparedness from forty-five states and the District of Columbia and by representatives of two state chairmen who could not themselves attend because of illness. There were also present official representatives of the Medical Corps of the Army and of the Navy, the United States Public Health Service and the Selective Service System, members of the Board of Trustees of the American Medical Association and several members of official personnel of constituent state medical associations.

CONFERENCES WITH GOVERNMENT OFFICIALS

On numerous occasions representatives of this committee have conferred in Washington, D. C., or at the Association's offices with government officials concerned with various phases of the national defense program. Individual members of the Committee have maintained official contact with Corps Area Surgeons in their respective areas and have attempted to be as helpful as possible to these most important officers.

STATE CHAIRMEN AND STATE AND COUNTY COMMITTEES

As soon as possible after the creation of the Committee on Medical Preparedness, each constituent association was requested to select some one of its members to serve as state chairman of the Committee. This request was promptly complied with, and a splendid group was quickly organized to represent the Committee in the major political divisions of the United States. The state chairmen have rendered invaluable service, without which it would have been impossible for this Committee to perform many of the duties assigned to it by the House of Delegates.

Constituent state medical associations and many component county and district medical societies have organized preparedness committees, and these have contributed splendidly to the success that has thus far been attained in the major undertakings of this Committee and its state chairmen.

SURVEY OF MEDICAL PERSONNEL

The major task assigned to the Committee by the House of Delegates involved an attempt to make a complete survey of medical personnel of the nation to determine the number of physicians available for service in various capacities and to develop facts that would be useful in aiding the profession to render the greatest possible service in any national emergency that might develop.

Among the objectives which the Committee hopes and expects to attain as fully as possible through this nationwide survey are (1) the number of physicians licensed to practice medicine, (2) the number capacitated for active service and the number of those incapacitated, (3) the number and location of physicians who may be qualified and available for service with the military forces of the nation and for other essential governmental services in case of national emergency, (4) the number available for service to the civilian population under emergency conditions, (5) the availability and qualifications of those who can serve acceptably in special fields of medicine, (6) the number and identity of physicians qualified for teaching and research who are believed to be essential for the proper maintenance of educational institutions and (7) the number and identity of physicians already engaged in government services.

QUESTIONNAIRES FOR SURVEY PURPOSES

For the purposes of a survey of such extensive and intensive nature, it was essential that information should be secured from the individual physician, and a questionnaire was prepared and submitted for criticism and suggestion to various qualified persons including the Surgeon General of each of three medical services of the federal government. It was not possible to include in the questionnaire all the items suggested since to do so would have necessitated the use of two cards for each physician and would have seriously retarded the compilation of data.

When the questionnaire was finally approved and prepared for distribution, a copy was sent with explanatory statements to every physician in the United States, its territories and possessions whose names and addresses were available. There is a surprisingly large movement of physicians even under normal conditions. The first mailings were made at a time of year when there were many changes of address, and consequently there was some delay in getting the schedules into the hands of some physicians. The total number of questionnaires distributed is in excess of 180,000, of which 150,407, or 82.9 per cent, had been filled in and returned by physicians in the United States as of April 1, 1941. Of the physicians in the territories and possessions, 1,571 have returned their questionnaires as of April 1, 1941, a return of 31.7 per cent.

While completed questionnaires are still being received, it may be that the total number of returns will not be greatly increased. Some physicians have mislaid the forms received or have been careless about returning them, and some because they are already engaged in government service or because they have retired or are incapacitated have assumed that it is not necessary to return the questionnaires. Others have perhaps failed to receive the schedules because of changes of address. A few have refused to cooperate in the survey.

It is highly important that every physician in the nation participate in this survey, through which an opportunity is

offered to compile data of the greatest immediate importance as well as of great historical value. If the information secured is properly utilized, it should be possible to provide necessary medical service for the military forces now on duty and for expanded forces in case of deepened emergencies with the least possible interference with the needs of the civilian population and of those of essential medical institutions.

COMPILATION OF DATA

The duty of collecting and compiling data secured through the survey was assigned by the Board of Trustees to the Bureau of Medical Economics. Practically every department in the offices of the Association has actively participated in promoting the work of the Committee on Medical Preparedness. Moreover, several independent scientific organizations have graciously offered cooperation, and their official representatives have rendered invaluable aid in various ways.

Questionnaires returned by individual physicians have been checked and edited as rapidly as possible for the purpose of transferring data to punch cards so that information can be readily provided, on demand, for the use of official agencies and for other essential purposes. For some time after the survey was initiated, it was necessary to "query" about 40 per cent of the questionnaires returned in order to secure more complete and more accurate data. On April 1 of the current year 138,263 punch cards had been prepared, and the process will be continued until fully completed.

SPECIAL LISTINGS

Listings of various groups in the profession have been partially prepared, and these will be completed when all questionnaires returned have been properly checked and available data transferred to punch cards.

The first listing was of general practitioners. From the available punch cards, arranged according to type of practice, it appears that 55,811 physicians are in general practice and that 78,960 devote special attention to some type of limited practice. Data obtained from 95,000 punch cards show that 12,604 physicians reported that they held commissions in medical corps. Of this number, 812 are members of the Medical Corps and 9,126 of the Medical Reserve Corps of the Army; 443 are members of the Medical Corps and 990 of the Medical Reserve Corps of the Navy; 789 are members of the Medical Corps of the National Guard, and 444 are officers of the Public Health Service. Additions are constantly being made to the Medical Reserve Corps and an unknown number of commissioned officers have resigned, so that, as this report is being prepared, the present strength is not known to the Committee on Medical Preparedness.

Listings of specialists in various fields of medicine have been made, and the Committee has received from organizations composed of specialists most valuable aid in an attempt to determine the availability and qualifications for special services.

An effort has been made to determine the number and locations of physicians qualified to serve in the field of industrial health, and the Council on Industrial Health has cooperated in this undertaking. A special questionnaire for this purpose was sent to 10,158 physicians, and 6,472 of these have been returned. As far as can be determined from available data, 1,177 physicians devote their full time to activities of various kinds in this particular field, 1,438 give more than half their time and 1,471 devote less than half their time to some phase of industrial health.

Other special listings are in course of preparation, including those pertaining to health officers and associated personnel, women physicians, incapacitated physicians and other groups.

ASSISTANCE OF THE AMERICAN MEDICAL ASSOCIATION IN
CLASSIFICATION AND PROCUREMENT OF PHYSICIANS
FOR MILITARY SERVICE

The Adjutant General of the Army has sent the following instructions to the Surgeon General and to each corps area and department commander:

1. The following plan has been approved and will be placed in operation at such time as the War Department may direct.

(a) The American Medical Association will prepare and maintain a roster of civilian physicians, classified as to profes-

1. 26 schedules apparently forwarded from Alabama but which probably should have been credited to other states.

2. 5 schedules apparently forwarded from Arizona but which probably should have been credited to other states.

3. 38 schedules apparently forwarded from Florida but which probably should have been credited to other states.

4. 12 schedules apparently forwarded from Kentucky but which probably should have been credited to other states.

5. 22 schedules apparently forwarded from New Hampshire but which probably should have been credited to other states.

6. 5 schedules apparently forwarded from South Dakota but which probably should have been credited to other states.

7. This figure includes the summation of notes 1 to 6 as they should be spread over the entire country.

* Figures in this column change constantly with the addition of new names and the movement of physicians from one state to another.

† The numbers in this column represent the schedules for which only incomplete information could be secured either by the State Medical Preparedness Committee or from the American Medical Directory. These schedules were prepared, with the information available, for some physicians who because of age, physical condition or other reasons did not file a schedule themselves.

sional specialties and proficiency, who have agreed to accept commissions in the Army of the United States when needed for immediate active duty during a national emergency.

(b) The Surgeon General will designate one or more medical officers of the Regular Army who will be placed on duty at Headquarters, Sixth Corps Area, as representatives of his office in all matters pertaining to the Medical Corps Reserve and the American Medical Association.

(c) Corps area commanders will report, at times specified by the War Department, the number of Medical Corps Reserve officers under their assignment jurisdiction who are available for active duty.

(d) Vacancies in allotments made to any corps area by the War Department that cannot be filled by the detail of a qualified Reserve officer under the assignment jurisdiction of the corps area commander will be promptly reported to the War Department, which will cause them to be filled from Medical Corps Reserve officers in the Army and Service Assignment group, or by adding these vacancies to the allotment of other corps areas having a surplus.

(e) If no qualified Reserve officer can be found, the Surgeon General will notify his representative at Headquarters, Sixth Corps Area, as to the qualifications desired and the location and grade of the vacancy. The representative will then secure recommendations from the American Medical Association and forward all information to the appropriate corps area commander, notifying the War Department of the action taken. The corps area commander will immediately cause the candidate to be given a physical examination and, if found qualified, will secure from the applicant a properly completed application for commission (W. D., A. G. O. form 170). All papers will then be forwarded to the Adjutant General for final action by means of air mail and "Immediate Action" stationery when necessary.

(f) Corps area commanders are not authorized to grant waivers for physical defects in these instances but may reject a candidate when found physically disqualified, notifying the Adjutant General of the action taken.

(g) On receipt of a properly executed oath of office, the corps area commander will cause orders to be issued placing the appointee on immediate active duty.

(h) No appointments will be made under this authority of applicants over 55 years of age.

(i) The appearance of the candidate before an examining board as prescribed in AR 140-5 will be waived in these cases.

2. The Surgeon General and corps area and department commanders will complete all arrangements necessary to place the plan in operation without delay when directed by the War Department.

NUMBER OF PHYSICIANS AVAILABLE FOR MILITARY SERVICE AND FOR SERVICE TO CIVILIAN POPULATION

It was proposed in the plan outlined by Colonel Dunham at the New York session that an attempt be made to ascertain how many and what physicians in states and counties may be available for service with the military forces and for service at home. It is not believed that any but those who know conditions which actually exist in the individual states, counties and communities can properly undertake to perform such a task. The Committee on Medical Preparedness has, therefore, turned to the state chairmen and state and county committees for aid in this difficult and delicate matter.

In some instances, state and county committees have been disinclined to designate any physician as one who should serve in one capacity and another who should remain at home. The Committee on Medical Preparedness can fully appreciate this feeling and, where it is known to exist, has asked that an estimate be made of the number of physicians who may be now or who may later become available for military service and the number believed to be essential for service at home. It appears to be difficult to make such estimates pertaining to large cities.

Through the splendid aid of state chairmen and of state and county committees, good progress is being made in the undertaking referred to in this section of this report.

STATUS OF MEDICAL STUDENTS, INTERNS AND TEACHING PERSONNEL

It is essential for the public interest and for the purposes that may develop in any great national emergency that a constant supply of well qualified young physicians should be assured. It is necessary too that our hospitals shall be enabled to function in the most efficient manner possible. A period of intern training is required for graduation by a number of the recognized schools of medicine, and good intern service is essential to the successful operation of the modern hospital with any considerable bed capacity and occupancy. It is, of course, necessary that the teaching forces of medical institutions shall be maintained to the highest possible point of efficiency under any conditions that may obtain. In the Selective Service Act there is no provision for the deferment of medical students beyond the termination of the current college year. Interns may be deferred until the completion of their current term of training. No provision has been made for the deferment of residents in hospitals.

The Committee on Medical Preparedness has given careful and continued consideration to these matters. One of the Committee's first official acts was to adopt and to forward to various high officials of the federal government a resolution urging that arrangements be made under which our medical schools could continue to operate to the highest possible advantage; that medical students, interns and residents be permitted to complete their training in schools and hospitals, and that neither the student bodies nor essential teaching personnel be depleted to an extent that would interfere with the production of an adequate supply of well trained graduates each year. These recommendations of the Committee have been renewed from time to time and have received the support of the Council on Medical Education and Hospitals, of the Subcommittee on Medical Education of the Health and Medical Committee of the Federal Security Agency and of other important groups.

Suggestions have emanated from some sources to the effect that classes in medical schools should be enlarged. This Committee is not in accord with such suggestions for reasons that are, no doubt, perfectly obvious to the members of the House of Delegates.

SELECTIVE SERVICE SYSTEM ACTS TO DEFER MEDICAL STUDENTS AND INTERNS

As this report was being prepared, the following statement was released to the press by the Selective Service System:

To meet a "growing national shortage of physicians and surgeons," reported by the Office of Production Management, a policy of deferment from military training of individual medical students "who give reasonable promise of becoming acceptable medical doctors" was proclaimed, May 4, by Brig. Gen. Lewis B. Hershey, deputy director of Selective Service. These deferments should be continued in each case as long as the student is progressing satisfactorily, he said.

General Hershey's memorandum, which summarizes the report of the OPM, was sent to all state Selective Service directors for communication to their local boards. It stresses the OPM statement that the shortage of physicians and surgeons affects both the nation's armed forces and the civilian population and that the utmost care must be exercised to meet both needs.

Local boards are urged to see that, while no practicing physician whose services are necessary to his community is called for military service, the requirements of the armed forces for physicians and surgeons also are filled. It also is stressed that where physicians, including interns, are eligible for military service they should be encouraged to apply for Medical Reserve Corps commissions, but that they will be inducted if they are placed in class I-A and fail to take advantage of the opportunity to be commissioned. In the case of interns it was pointed out that, if commissioned, they will be deferred from active duty by the War Department to complete one year's internship.

Summarizing the OPM report on its study of the situation, General Hershey pointed out that it indicates a present need of around 9,000 medical officers for the Army, Navy, Public Health Service and Veterans Administration in addition to present staffs. This approximates a reduction of about 5 per cent in the number of physicians now available for service in

civilian life, and it is estimated that the further demand caused by health problems in communities expanded by new defense industries will increase this civilian need to about 10 per cent.

In addition to the 9,000 additional medical officers required by the Army, Navy and other defense agencies, General Hershey said the OPM report showed a probable annual turnover of around 3,500 because of retirement of regular medical officers and the expiration of tours of duty of reserve medical officers.

The OPM report estimates that there are 155,000 practicing physicians in the United States, of whom about 27,000 are 65 years of age or older, and the mortality is around 3,800 a year. Their places can be filled only by medical graduates who enter the profession each year and their number is estimated at approximately 5,000, of whom only 60 to 65 per cent probably would be qualified physically or otherwise for military service.

Commenting on this situation in announcing the Selective Service policy of deferring medical students who are making satisfactory progress in their professional training, General Hershey's memorandum to state directors stated:

There are no replacements for medical students who are withdrawn from school. Consequently if the supply of medical students who are to be graduated into the medical profession is reduced through their induction to serve in a nonprofessional capacity, an increasing reduction of physicians available for military service as well as an aggravation of the increasing overall national shortage will result.

As an outline of policy and procedure for the Selective Service System concerning medical students, General Hershey quoted the OPM report:

It is of paramount importance that the supply be not only maintained but encouraged to grow, and that no student or intern who gives reasonable promise of becoming an acceptable medical doctor be called to military service before attaining that status.

Local boards were cautioned, however, that deferment is not an exemption and that the obligation and liability for military service remain on its expiration.

General Hershey's memorandum also called attention to a previous one, issued on April 22, prescribing procedure for deferment of individual students in a number of specialized professional fields which were suggested by the Office of Production Management. This memorandum suggested procedure for presenting local boards with detailed facts concerning individual students, which was prepared by the American Council of Education and concurred in by National Headquarters of the Selective Service System. As set forth in a bulletin (number 10) issued by the council, this provides for getting into the hands of the local board of a "student statement of information" concerning his status and plans, and an affidavit by his college or university in which the college officials testify as to his standing, courses and occupational objectives, together with a general evaluation of the student as a "necessary man" for occupational deferment.

ESSENTIAL TEACHERS

At the request of the Committee on Medical Preparedness, the deans of medical schools have been asked, through the Council on Medical Education and Hospitals, to provide lists of personnel believed to be essential for teaching purposes.

MEDICAL EXAMINERS AND MEMBERS OF BOARDS

A large number of physicians are serving as examiners for draft boards and as members of advisory, induction and appeal boards and in other capacities under the Selective Service Act. Medical examiners and members of advisory and appeal boards serve without compensation. The exact number of those engaged in such service is not known to the Committee at this time.

There have been complaints that in some instances medical examiners have been required to devote an undue amount of time to their duties in such capacity. In many places alternate examiners have been appointed to share the work, and in some instances resident physicians have offered their services so that the work involved might be equably spread. In some areas alternates have been appointed to serve as members of induction boards so that no member would be required to give his entire

time during examination periods. In some cities all examinations of registrants are conducted in hospitals, and this arrangement seems to have been satisfactory to all concerned.

SOURCE OF SUPPLY OF MEDICAL OFFICERS

Physicians for service as medical officers can now be secured only from the Medical Reserve Corps. Students approaching graduation at recognized schools and interns who will complete their training within a specified time may apply for commissions and, if eligible, may receive commissions in the Medical Reserve Corps, and assignments to extended active duty may be deferred until courses of training are completed.

COMMITTEES CONCERNED WITH THE NATIONAL DEFENSE PROGRAM AND OTHER ACTIVITIES

The Health and Medical Committee of the Federal Security Agency is composed of Dr. Irvin Abell, Chairman; Major General James C. Magee, Surgeon General of the United States Army; Rear Admiral Ross T. McIntire, Surgeon General of the United States Navy; Dr. Thomas Parran, Surgeon General of the United States Public Health Service, and Dr. Lewis H. Weed, Chairman of the Division of Medical Sciences of the National Research Council. This Committee was originally appointed by Executive Order "To advise the Council of National Defense regarding the health and medical aspects of National Defense and to coordinate health and medical activities, affecting national defense." Other purposes to be served by the Health and Medical Committee were designated. At a later time the committee was transferred, by Executive Order, to the Federal Security Agency.

The National Research Council, cooperating with the federal government, has created a number of committees concerned most largely with various scientific aspects of the national defense program. Dr. Morris Fishbein, an ex officio member of the Committee on Medical Preparedness, is a member of the Executive Committee of the Division of Medical Sciences of the National Research Council and Chairman of the Committee on Information of that Division.

There seemed to be need for the publication of a special journal pertaining to military medicine, and the Board of Trustees authorized the publication of a periodical to be known as *WAR MEDICINE*. The active cooperation of the Division of Medical Sciences of the National Research Council has been generously extended in making possible the publication of this new periodical, which has been received with great interest in the United States and has attracted attention from official and unofficial sources in other countries.

The Chairman of the Council on Foods and Nutrition of the American Medical Association is serving as chairman of the Subcommittee on Nutrition of the Division of Medical Sciences of the National Research Council.

A National Conference on Nutrition is to be held in Washington, D. C. The Board of Trustees and the Council on Foods and Nutrition have assured the President of the United States and the Federal Security Administrator of active cooperation in this movement.

Dr. R. G. Leland, Director of the Bureau of Medical Economics, has served as a member of a committee of the Division of Vital Statistics of the Bureau of the Census and as a member of a committee of the Selective Service System and has cooperated with the Office of Procurement and Management. Conferences have been held with representatives of the National Resources Planning Board relative to the maintenance of lists of specialists in the basic medical sciences.

The Committee on Medical Preparedness of the American Medical Association has maintained the closest possible contact with the aforementioned committees, and most pleasant and cooperative relations have resulted.

PENDING FEDERAL LEGISLATION

A number of bills pertaining to one or another phase of the national defense program have been submitted to the Congress now in session. Senate Bill 783, introduced by Senator Murray of Montana, provides, among other things, that (1) students who are preparing for the degree of doctor of medicine or bachelor of medicine at medical schools, (2) students who are

preparing for the degree of doctor of dental surgery or doctor of dental medicine at dental schools, (3) hospital interns and resident physicians and surgeons who are graduates of medical schools and are eligible as such graduates for the examinations given by the National Board of Medical Examiners or who were so eligible at the time of their graduation at such medical schools, (4) hospital dental interns and resident dentists who are graduates of schools of dentistry or hold degrees of doctor of dental surgery or doctor of dental medicine, and (5) teachers at medical and dental schools shall be exempt from training and service but not from registration under the Selective Training and Service Act. This bill further provides that medical and dental students, hospital interns and resident physicians, surgeons and dentists and teachers in medical and dental schools who are members of a reserve component of the land and naval forces of the United States may not, if the bill should be enacted, be ordered or called to active duty or into active service in any of such forces, except in time of war, and that any such persons already called into active service who if the pending bill had been enacted would have been exempt from such service shall be discharged on their own request. A further discussion of S. 783 will be found in that part of the Report of the Board of Trustees pertaining to the work of the Bureau of Legal Medicine and Legislation. Hearings were held on this bill on March 18, 19 and 20, 1941, and some proposed amendments were offered. Statements have appeared in the public press indicating that this bill had been tabled indefinitely by the Committee on Military Affairs of the Senate, but information received as this report is in process of preparation is to the effect that an effort will be made to have the bill reported out by the Senate Committee.

H. R. 3571, introduced by Representative McCormack of Massachusetts, pending in the House Committee on Military Affairs, provides that no individual who is licensed to practice medicine under the laws of any state, territory or the District of Columbia shall be ineligible for appointment or for examination for appointment as a medical officer in the active or reserve components of the military or naval forces of the United States solely by reason of any rating or classification of the medical school at which such individual graduated.

H. R. 4184, introduced in the House of Representatives by Mr. Flannery of Pennsylvania, would specifically authorize the President to provide for the deferment from training and service, under such rules as the President may prescribe, of those men engaged in the study of medicine considered to be necessary to the maintenance of the national health in service or industry.

H. R. 4418, introduced by Mr. Faddis of Pennsylvania in the House of Representatives, is identical with a bill originally introduced in the Senate at the previous session of Congress by Senator Murray of Montana.

Various other bills have been submitted to Congress, all of which have some bearing on national defense. Among these is H. R. 3204 providing for an appropriation of \$525,000 for the fiscal year ending June 30, 1941 to enable the United States Public Health Service to assist state and local health authorities in health and sanitation activities in areas adjoining military and naval reservations or where there are concentrations of military and naval forces and in areas adjoining government and private industrial plants engaged in defense work. Another bill, H. R. 3570, proposes an appropriation of \$150,000,000 to provide additional community facilities made necessary by national defense activities. Under the provisions of this bill, \$25,000,000 would be used for the construction of hospitals and \$4,200,000 for the construction of clinics. In addition, annual grants of \$2,200,000 would be made for hospital care of transient indigents, \$2,800,000 for the ambulant care of transient indigents and \$1,000,000 for hospital operation.

A bill has been submitted to Congress contemplating the development of plans for school programs of physical education and "instruction and guidance in healthful living and wider recreational use of school facilities and plans for the establishment of school camps."

Various plans for the rehabilitation of the youth of the country and especially of Selective Service Registrants and others who will become eligible for registration have been proposed.

PHYSICIANS FOR SERVICE IN GREAT BRITAIN

Early in April 1941 a request came to the American Medical Association to cooperate with the American Red Cross in an effort to secure physicians up to the number of one thousand who would volunteer for service with the British army and the British emergency medical service. The American Red Cross is officially cooperating in this undertaking with the British Red Cross with the approval of the President of the United States and of official agencies of the federal government.

Through the use of the punch card system as it has so far been developed, the names of physicians who may be eligible for service abroad as indicated have been made available to the American Red Cross, which will communicate directly with these physicians. Information concerning this matter has appeared in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* and has been widely disseminated through radio broadcasting systems.

LIAISON OFFICER

Lieut. Col. Charles G. Hutter, M. C., U. S. Army, has served for several months as liaison officer of the Medical Corps of the Army with the Committee on Medical Preparedness. Colonel Hutter has been most helpful to the Committee and to those in the Association's offices who are concerned with the preparedness program and has won the respect and esteem of all who have been associated with him.

MEDICAL PREPAREDNESS SECTION OF THE JOURNAL

Through the establishment of the Medical Preparedness Section of *THE JOURNAL*, a mass of material pertaining to many phases of the national defense program has been made generally available. Abstracts of the minutes of meetings of this Committee and a large amount of information concerning official regulations, legislation, activities of state committees and of government services and many other matters have appeared in this section.

CORRESPONDENCE

The correspondence pertaining to the work of the Committee on Medical Preparedness and to the general preparedness program has been tremendous in amount. Effort has been made to reply as promptly as possible to every communication received, though there was a period of eight weeks during which the trial of the case of the United States versus the American Medical Association et al. was in progress when it became impossible to make prompt reply to all communications.

CONCLUSION

Many other matters than those referred to in this report have received official consideration by the Committee on Medical Preparedness. The Committee has earnestly attempted to discharge the duties imposed on it by the House of Delegates and in these efforts has received the most generous assistance from numerous sources, including scientific medical organizations and official committees of those organizations, government officials including the Surgeon Generals of the three major medical services of the government and members of their staffs, and Corps Area Commanders and Corps Area Surgeons.

The Committee desires especially to commend the state chairmen of the Committee on Medical Preparedness for their invaluable service in promoting the national survey of physicians and for the splendid work they have done in connection with other matters. State and county committees on medical preparedness have made fine contributions toward the accomplishment of the medical preparedness program of the American Medical Association. To all of these and to others not specifically mentioned in this report the Committee desires to acknowledge its deep sense of appreciation.

Respectfully submitted.

ORGANIZATION SECTION

2783

Resolution Requesting Establishment of Procurement and Assignment Agency

Dr. Irvin Abell, Chairman, Committee on Medical Preparedness, presented the following resolution, which was referred to the Reference Committee on Executive Session:

WHEREAS, The President of the United States has declared that we are in a state of unlimited national emergency, and the Surgeon General of the United States Army requested the American Medical Association in June 1940 at the annual session to aid in the procurement of approximately 150,000 physicians as well as a statement as to their training, experience and specialization; and

WHEREAS, The American Medical Association established a Committee on Medical Preparedness which has now on hand the records of approximately 150,000 physicians as well as a statement as to their training, experience and specialization; and

WHEREAS, The sudden entrance of the United States into a war might immediately require the services not only of the physicians already called to duty but of a very considerable additional number; and

WHEREAS, Neither the American Medical Association nor any other civilian agency has the responsibility or the authority for the selection of those physicians who would be necessary for immediate duty and who would be called from civilian practice into service with the military agencies; therefore be it

Resolved, That the United States government be urged to plan and arrange immediately for the establishment of a central authority with representatives of the civilian medical profession to be known as the Procurement and Assignment agency for physicians for the Army, Navy, and Public Health Service and for the Civilian and Industrial needs of the nation.

This recommendation is made to avoid or minimize confusion and the inevitable delay which would result from the lack of such an arrangement. It is further recommended by the Committee on Medical Preparedness that, if this resolution is approved by the House of Delegates, a copy of it be sent to the President of the United States, the Secretary of War, the Secretary of the Navy, the Chairman of the Senate and House Committee on Military Affairs, the Administrator of the Federal Security Agency, the Surgeon General of the United States Army, the Surgeon General of the United States Navy, the Surgeon General of the United States Public Health Service, the Adjutant General of the Army and the Health and Medical Committee.

The Training of Physicians Must Be Continued Without Interruption

Dr. Irvin Abell, Chairman, Committee on Medical Preparedness, presented the following statement, which was referred to the Reference Committee on Executive Session:

A Joint Conference of the Committee on Medical Preparedness of the American Medical Association and the Council on Medical Education and Hospitals, held at the Statler Hotel in Cleveland on Monday, June 2, prepared the following statement for transmission to the Secretary of War and to the Surgeon General of the Army:

1. Since the five year preparedness program of the government may require all graduates of approved medical schools annually, in addition to those who may be available from other sources, to enter the service of the Army, Navy and Public Health Service for a year's training, the education of physicians must be continued at the present level and without interruption.

2. The education of physicians is so vital that we urge the War Department to provide for all medical students in approved medical schools and for premedical students accepted for enrollment in approved medical schools some form of military status which will make clear the fact that, in preparing themselves to become physicians for the services of the country, these students are already actually giving an essential service under the preparedness program and are not seeking to evade, escape or defer their responsibilities.

Report of Council on Scientific Assembly

Dr. James E. Paullin, Chairman, presented the following report, which was referred to the Reference Committee on Sections and Section Work:

The Council on Scientific Assembly recommends to the House of Delegates of the American Medical Association that the annual session to be held at Atlantic City in 1942 be made a Pan American meeting and that representatives from all South and Central American countries, Mexico, Cuba, Puerto Rico and Canada be invited to attend and participate in the scientific session program.

Report of Council on Foods and Nutrition Dealing with the National Nutrition Conference for Defense

Dr. James E. Paullin, Section on Practice of Medicine, on behalf of Dr. James S. McLester, Chairman of the Council on Foods and Nutrition, who was not in attendance because of the illness of his mother, presented the following report, which was referred to the Reference Committee on Executive Session: The National Nutrition Conference for Defense, on the call of the President, was held in Washington during the week of May 26.

Approximately nine hundred persons were in attendance, and of the entire personnel of the conference about 15 per cent were physicians. Nutritionists, social workers, labor representatives, economists, manufacturers of food and others made up the bulk of the membership. In a movement of this kind, leadership should remain in the hands of the medical profession. The work of the conference was conducted in nine previously selected sections, each of which dealt with a different phase of nutrition. The objectives of the conference as a whole and the general trend of the recommendations merit your entire approval.

The following resolution is submitted for your approval:

Resolved, That the House of Delegates of the American Medical Association expresses its approval of the general objectives of the National Nutrition Conference for Defense called by the President of the United States and specifically endorses the following recommendations:

1. That research in nutrition be encouraged, with an aim primarily toward (a) Improvement of presently known chemical and biological procedures for estimating the amounts of the essential nutrients in foods and their physiologic availability; (b) more refined technic for the detection of nutritional deficiency states, especially in the subclinical degrees of intensity; and (c) more precise determination, for each of the nutrients, of the optimum and minimum requirements of human subjects under varying conditions;
2. That special attention be paid to the diets and nutritional status of all workers in industry and particularly of those most directly concerned with the national defense effort;
3. That, in providing an adequate diet for pregnant and lactating women and for children, the necessity be appreciated for taking into consideration the whole family situation and the limitations of the budget;
4. That closer cooperation between medical and public health groups and other agencies interested in nutrition be established in order that effective local action may be taken;
5. That medical societies, dental societies and health authorities be represented on all state and community nutrition committees and that medical groups take an increasingly active part in organizing, sponsoring and cooperating in nutrition programs;
6. That efforts be made to stimulate greater interest in nutritional problems among general practitioners and, with this in view, that opportunity for postgraduate training in nutrition be made more widely available, and finally, but vastly more important,
7. That schools of medicine give greater thought to the teaching of nutrition.

Respectfully submitted.

JAMES S. McLESTER, Chairman.

Report of Committee on Legislative Activities

Dr. E. H. Cary, Chairman, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations, with the exception of that portion which relates to the construction of community facilities, which was referred to the Reference Committee on Executive Session:

As the Congress for the last year has given primary consideration to measures dealing with defense problems, it has not been found necessary for the Committee on Legislative Activities to function actively in connection with any particular federal legislation.

The report of the Bureau of Legal Medicine and Legislation brought to your attention a survey of all the bills which have been introduced that are of sufficient importance for any consideration.

Hospital Construction Bill S. 1230 was reintroduced by Senator Brown, for himself and Senators Wagner and George, embodying all the objectionable features commented on by the House of Delegates at the New York session. It may be worth while to call your attention to the fact that, when the bill was before the Senate in the 76th Congress, it was amended on the floor with the words "The eight appointed members shall be selected from leading medical, osteopathic or scientific

Hospital Association and the Protestant and Catholic hospital associations of the United States, the conjoint committees to study and submit reports to their respective national bodies, in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in prepayment hospitalization and similar plans, the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association, was approved by your reference committee, which recommends its adoption.

(b) The second portion of these resolutions, requesting the Board of Trustees to proceed to these matters as expeditiously as may be possible, and to submit the committee's report, with such suggestions and/or recommendation that the Board of Trustees may wish to attach thereto, at the next annual session of the American Medical Association, the Board of Trustees to be authorized in the interim to advise the constituent state associations of the American Medical Association concerning tentative or other agreements that may have been reached, is emphatically approved by your reference committee at this time because the subject matter of this resolution was presented both at the St. Louis and at the New York session but finds that the extra work thrown on the administrative offices of our organization by court procedures and by the medical preparedness program has made it well nigh impossible to make a careful study and report covering the subject matter involved in this resolution.

2. Medical Service Plans: Your reference committee further recommends that the specialty societies, such as radiologists, pathologists and anesthesiologists, recommend to their members that they defer entering into contractual relationships with hospitals involved in medical service plans until the relationship has been thoroughly clarified as requested in the resolutions from the California Medical Association.

Respectfully submitted.

HENRY A. LUCE, Chairman.
F. J. PINKERTON.
JOHN H. FITZGIBBON.
TERRY M. TOWNSEND.
F. S. CROCKETT.

Report of Reference Committee on Amendments to the Constitution and By-Laws

Dr. William Weston, Chairman, presented the following report, which was adopted on motion of Dr. Weston, seconded by Dr. Arthur T. McCormack, Kentucky, and carried:

Your reference committee approves of the amendment to the By-Laws, chapter XV, section 1, item 7, to change the name of the Section on Pharmacology and Therapeutics to the Section on Experimental Medicine and Therapeutics.

Respectfully submitted.

WILLIAM WESTON, Chairman.
EDMUND R. BRUSH.
EDWARD M. PALLETTE.
J. N. BAKER.
WALTER W. KING.

On motion of Dr. Arthur T. McCormack, Kentucky, seconded by Dr. George W. Kosmak, New York, and carried, chapter XV, section 1, item 7 was amended to read "7. Experimental Medicine and Therapeutics."

Report of the Reference Committee on Reports of Board of Trustees and Secretary

Dr. Francis F. Borzell, Chairman, presented the following report, which on motions duly seconded and carried was adopted section by section and as a whole:

REPORT OF THE SECRETARY

Your reference committee has reviewed the report of the Secretary. It is pleased to emphasize the report of continued growth in our membership. Gratifying as this progress is, examination, however, of the tabulation made by states indicates fertile fields for cultivation that should be tilled.

The report of the Secretary on Fellowship enrolments shows also a wholesome increase in the number of Fellows, but here too we would wish to see an accelerated growth.

Your reference committee notes with appreciation the greatly augmented field work carried on by the officers, both elective and administrative, over the past year.

Your reference committee feels that the Secretary's modest report presents but inadequately the true story of the faithful stewardship of Dr. West. With the ever increasing demands on the Secretary in time and energy, the committee expresses the wish that all consideration be given to the possible necessity for providing him with added assistance.

Your reference committee urges the House of Delegates to take heed to its own prior action that memoirs and resolutions be forwarded to the Secretary, wherever possible, thirty or sixty days before the annual session.

REPORT OF THE BOARD OF TRUSTEES

1. Your reference committee concurs with the Board of Trustees in the expression of grief at the loss by death of one of their faithful members, Dr. Austin A. Hayden, and of Dr. Paul Nicholas Leech, the Director of the Division of Drugs, Foods and Physical Therapy, Secretary of the Council on Pharmacy and Chemistry and Director of the Chemical Laboratory.

Income and Expenditures: Your reference committee notes with satisfaction the healthy state of the finances of our Association. The details are published and need no elucidation. They indicate most efficient and judicious administration by the Board of Trustees.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION: Your reference committee is pleased to note the continued success of THE JOURNAL both as the universally recognized leader in its field and as to the increase in circulation. Here also our editorial and business personnel are to be commended for their efficiency. Your committee would emphasize the added significance of this growth in the light of experiences in war-torn foreign countries.

Press Relations: Your reference committee respectfully recommends careful reading of this section of the Report of the Board of Trustees. Because of the far reaching influence of friendly press relations and because of occasional unwarranted criticisms by the uninformed, your reference committee recommends the widespread publication of this part of the report in county and state society journals. Your reference committee recognizes the invaluable services of the Editor in establishing these favorable press relations. One striking example is the prompt radio and press publicity in reference to contaminated sulfathiazole.

2. Special Journals: Your reference committee is pleased to note the growth in circulation of the special journals. It also commends the valuable addition of the new publication WAR MEDICINE.

Library: While the activities of the package library service show some increase, your reference committee would recommend more widespread use of these reference facilities than at present.

HYGEIA: Your reference committee notes with satisfaction the increasing popularity of HYGEIA, particularly as a reference publication for health and education. It urges increased local activities looking toward wider distribution of this publication.

Council on Pharmacy and Chemistry: The report of the activities of the Council on Pharmacy and Chemistry emphasizes anew the importance of this department. Investigation by the Council of the newer chemotherapeutic agents, vitamins and hormones are proving invaluable to the profession and to the United States Food and Drug Administration. Your reference committee commends the Council for its continued successful functioning.

Council on Foods and Nutrition: The report of the Council on Foods and Nutrition indicates timely attention to the problems of nutrition, emphasized by the needs of national defense. Your reference committee respectfully recommends that this council be urged to keep in closest touch with federal movements in the field of nutrition to insure intelligent medical direction of public programs.

3. Council on Physical Therapy: Your reference committee, while commending the Council for its continued valuable ser-

vices, calls especial attention to the importance of the studies on roentgen ray problems and urges widespread publicity of the article on "X-Ray Protection" published in *THE JOURNAL*. Reprints should be widely distributed to hospitals and roentgenologists.

Council on Industrial Health: The report of this council is recommended by your reference committee for full approval. Your reference committee considered carefully the importance of the relations of this council to national defense as indicated in its report. It urges careful study of the report by the members of this House that they in turn may institute the necessary cooperative activities in their respective state organizations. Your reference committee commends the Council for its forehanded liaison with federal agencies and recognizes the importance of joint functioning of committees on industrial health in state medical associations with bureaus of industrial hygiene and workmen's compensation commissions in the state governments.

Committee on Scientific Research: The report of the Committee on Scientific Research calls for no special comment from your reference committee. It did note, however, a rather large number of completed grants the results of which are still "to be published." Doubtless more detailed explanation might elucidate.

4. Bureau of Medical Economics: The report of the Bureau of Medical Economics is divided into four headings, the first three of which deal strictly with medical economics while the fourth is a report of its activities for the Committee on Medical Preparedness. Each division is of sufficient importance to call for separate attention by this reference committee.

(a) **Prepayment Plans for Medical Care:** This is a report of trends and tendencies to date in this field. The bureau has made certain deductions which call for serious consideration by the members of this House. It emphasizes the trends toward increasing utilization of tax funds in the provision of medical care. Certain observations are then made which, in the opinion of your reference committee, are of sufficient importance to warrant their emphasis by way of specific approval.

Your committee seriously considered the added tasks incident to the work assigned to the bureau by the medical preparedness census, particularly in the light of possible curtailment or arrest of further necessary study of the ever increasing numbers of prepayment medical service plans. It is recommended that the Board of Trustees take whatever steps are necessary to insure the continuity of this important phase of the work of this bureau to the end that there may be established some method of coordination and interchange of material pertinent to the administration of such plans in order that all state and county medical societies may profit thereby.

Your reference committee further recommends that the House of Delegates reaffirm its belief that the principle of prepaid medical care justifies an experimental period during which time advice and assistance be given to medical societies that elect to conduct such experiments under medical sponsorship. It therefore recommends special consideration and approval by the House of this portion of the report.

(b) **Survey of Medical Services:** Under the heading of Survey of Medical Services and Facilities for the Care of Crippled Children is a report of certain activities of the bureau which apparently resulted in information of value to many. Your reference committee notes the absence of any reference to proposed publication of the conclusions of this survey.

(c) **Group Medical Practice:** Group Medical Practice is considered under another heading. The conclusions in the report deserve detailed consideration by the members of this House. Your reference committee recommends that studies of group medical practice be continued with a view toward further clarification.

Another division of the report of the bureau deals with a report on a survey of physicians for the Committee on Medical Preparedness as a part of our efforts to assist the Surgeon Generals of the Army, Navy and Public Health Service. Your reference committee is impressed with the size of this task undertaken by the bureau and gratified with the efficiency of its accomplishment.

5. Bureau of Health Education: Your reference committee recommends approval of the report of the Bureau of Health Education. This report epitomizes a year of intense activity of the kind to bring credit on the American Medical Association and the American physician.

The public relations value of this bureau is second only to its value as an authoritative health educational agency. Its policy of cooperative assistance and advisory guidance of governmental and lay organizations interested in health education calls for wholehearted approval by this House and your reference committee so recommends.

6. Bureau of Legal Medicine and Legislation: Without attempting a detailed consideration your reference committee notes with approval the evidence of vigilant scrutiny of proposed legislation affecting medicine and health obvious in the report of this bureau, which deserves detailed consideration by the members of this House.

It is noted that twenty-five states have now adopted legal measures to control the dispensing of barbiturates only in medical prescriptions. Your reference committee recommends to the House of Delegates that efforts be put forth to stimulate the remaining states to adopt similar legislation.

7. Supplementary Report of the Board of Trustees: Your reference committee recommends that the Board of Trustees be asked to establish a Commission on Pan American Relations to advise on the various problems of Pan American import.

Your reference committee is impressed with the multifarious responsibilities of the Board of Trustees and the bureaus functioning under its direction. Especial commendation is extended to the executive directors of these bureaus. To them belongs the credit for their efficient operation.

Respectfully submitted.

FRANCIS F. BORZELL, Chairman.
F. J. SAVAGE.
ROBERT A. PEERS.
MEREDITH MALLORY.
WILLIAM R. BROOKSHER.

Report of Reference Committee on Miscellaneous Business

Dr. Charles G. Strickland, Chairman, presented a report which as amended reads as follows:

1. Resolution Requesting Appointment of a Committee to Survey the Relationship of Medicine and Law: There appeared before your reference committee as proponents of this resolution Professor Moritz, newly appointed professor of legal medicine at Harvard, and Drs. Dwight O'Hara and Charles E. Mongan, Massachusetts. These gentlemen stated that as early as 1931 a committee had been appointed by the House of Delegates of the American Medical Association to work with the Bureau of Legal Medicine and Legislation to formulate a solution of the problem with which this resolution deals and that this committee apparently fell by the wayside.

Your reference committee recognizes the merit of the position taken by the resolution and strongly sympathizes with its intent. However, owing to widely differing conditions, both geographic and political, existing in the forty-eight states, the length of time necessarily required and the possible expense involved to accomplish its purpose, your reference committee recommends that, instead of passing this resolution as introduced, the House of Delegates refer it to the Board of Trustees and request sympathetic study of the problem involved.

2. Resolution Requesting Appointment of a Committee to Study the Question of Determination of Serum Sensitivity: The possibilities opened up by this resolution were discussed by your reference committee at length. The plan suggested has merit and deserves further study. Other conditions than serum sensitivity, as, for instance, diabetes and epilepsy occurring in persons admitted to hospitals in coma and without history, would be similarly helped and the patient protected if a standard tattoo code covering all these ailments could be devised. It would be, however, a long time before such a tattoo code could come into general use because of reasons which will readily occur to you. Your reference committee therefore recommends that, instead of accepting or rejecting this resolution, the House of Delegates

refer it to the Council on Scientific Assembly for study and such action as your Board of Trustees may order.

3. Resolution Requesting Appointment of a Committee to Confer with Specialty Boards: Your reference committee feels it inadvisable to set up a special committee for the purpose designated. Some inequalities in distribution of medical care undoubtedly exist. It recommends that the Michigan State Medical Society's resolution be referred to the Board of Trustees for its information and such action as it may care to take.

Respectfully submitted.

CHARLES G. STRICKLAND, Chairman.
FREDERIC E. SONDERN.
HOLMAN TAYLOR.
CHARLES E. KIELY.
ANDREW F. MCBRIDE.

It was moved by Dr. Strickland, seconded by Dr. Frederic E. Sondern, New York, and carried after discussion by the Secretary, that the first section of the report of the reference committee, referring to the Board of Trustees the resolution regarding a survey of the relationship of medicine and law, be adopted.

It was moved by Dr. Strickland that the second section of the report of the reference committee, referring to the Bureau of Health Education the resolution dealing with the determination of serum sensitivity, be adopted, and the motion was seconded by Dr. Arthur T. McCormack, Kentucky. The suggestion was offered that the matter be referred to the Council on Scientific Assembly and Dr. Strickland accepted this suggestion, following which this section of the report of the reference committee was adopted, as amended, after discussion.

Dr. Strickland moved that the third section of the report of the reference committee, referring to the subject of specialty boards, be adopted, and the motion was seconded by Dr. J. Newton Hunsberger, Pennsylvania, and adopted after discussion by a number of delegates.

On motion of Dr. Henry A. Luce, Michigan, seconded by several, and carried, a resolution dealing with hospital privileges for general practitioners, which had been before the House, was rereferred to the reference committee.

On motion of Dr. Strickland, seconded by Dr. John Z. Brown, Utah, and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Sections and Section Work

Dr. George W. Kosmak, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Kosmak, duly seconded and carried:

Your Reference Committee on Sections and Section Work has given careful consideration to the Report of the Council on Scientific Assembly as well as to the resolution introduced by Dr. Henry A. Luce, Michigan.

1. Report of Council on Scientific Assembly: The recommendation dealing with the change of name of the Section on Pharmacology and Therapeutics to "Section on Experimental Medicine and Therapeutics" is approved by your reference committee and submitted for action by the House.

Commendation and approval of the scientific program developed for this session by the Council is hereby extended.

2. Resolution Requesting the Creation of a Section on General Practice: Careful consideration was given to the question of establishing a new "section for the general practitioner." This was felt by the Council on Scientific Assembly to be undesirable. Your reference committee discussed the matter in connection with the resolution presented by Dr. Luce and submits to this House its belief that an experimental "session" in the Section on Miscellaneous Topics be established for the purpose of testing out the plan at the next session of the Association. If successful in point of attendance and interest, the question of establishing a permanent section can then be given further consideration.

Your reference committee feels that the general practitioner constitutes such an important and numerous factor in the membership of this Association that his requests should be given due consideration.

If the House reacts favorably to our suggestion, the officers appointed to conduct the "session" must be selected with a view to presenting a program that will meet the requirements of the situation.

3. Request of Council on Scientific Assembly that Atlantic City Session in 1942 Be Made a Pan American Session: Your reference committee desires to commend the proposition in the supplementary report of the Council on Scientific Assembly and fully approves of the recommendation contained therein that the annual session to be held in Atlantic City in 1942 be developed as a Pan American gathering and that representatives from all South and Central American countries, Mexico, Cuba, Puerto Rico and Canada be invited to attend and participate in the program of the Scientific Assembly.

Respectfully submitted.

GEORGE W. KOSMAK, Chairman.
HILTON S. READ.
ROLLO K. PACKARD.
DAVID D. SCANNELL.

Report of Reference Committee on Rules and Order of Business

Dr. Thomas F. Thornton, Chairman, presented the following report and moved its adoption:

Your reference committee recommends that at the close of this meeting the House recess to convene in regular executive session at 2 o'clock this afternoon.

Respectfully submitted.

T. F. THORNTON, Chairman.
FLOYD S. WINSLOW.
JAMES Q. GRAVES.
JOSEPH F. SMITH.
E. N. ROBERTS.

Dr. R. W. Fouts, Nebraska, moved as a substitute that the House convene in regular session at 2 p. m. and meet in executive session at any time it desires after that, and the motion was seconded by Dr. Thomas A. McGoldrick, New York, and carried.

The report of the reference committee was then adopted as amended.

Report of Reference Committee on Reports of Officers

Dr. C. W. Roberts, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. Roberts duly seconded and carried:

1. Address of Speaker: Your reference committee desires to commend the Speaker for his zeal, both in spirit and in the performance, which has made possible the accomplishment of his hope that the actions of this House would reflect an atmosphere in which deliberate judgment and unregimented conclusions regarding the various matters brought before it would prevail. It knows that the past pronouncements of the House have issued from strict parliamentary procedure notwithstanding allegations in certain quarters to the contrary. Your reference committee joins the Speaker in support of his purpose to preserve a practice which has made of this House a model for deliberative bodies seeking to exemplify democratic processes in government.

The Speaker posed a question to the House. "Whom do you represent? What interest or interests do you espouse?" Gallantly the answer was frankly forthcoming in his own words, which your reference committee paraphrases. It is a profession based on ideals which you truly represent. In a world where so-called realism is offered as a panacea for all our ills and expediency adjudged decent as a camouflage for questionable political manipulations, it has become a little old fashioned to confess in intellectual circles to a reverence for idealism. Notwithstanding, your reference committee desires to commend the Speaker for his emphasis of the fact that medicine rests today as it has in the past on the cornerstone announced in the opening sentences of the Principles of Medical Ethics. A profession has for its primary object the service it can render to humanity; reward or financial gain should be a subordinate consideration. This has been a basic principle of medical ethics since the time of Hippocrates. If more than lip service to this

ORGANIZATION SECTION

2789

principle is to be given, the Speaker catalogues a few familiar qualities which must continue to characterize our membership: integrity, courage, wisdom, tolerance, ability, vision. He intimates that if medicine falls from its high estate as a profession to that of a trade it will not be by judicial decree but through a neglect of the eternal values that have made our profession one for which we are proud to live and in which we are content to die. Together with its thanks to the Speaker, your reference committee asks for a rededication of our profession to these moving sentiments in the sure knowledge that we may thus justify the confidence which a grateful public has lavished on us.

2. Address of the President: Dr. Van Etten touched pointedly on a number of matters of great interest to our entire profession. Your reference committee would emphasize his insistence on the value of postgraduate education and the necessity of the physician of today relating his thinking to our changing social picture. Your reference committee wishes here to express its appreciation for his many contributions to the study of the complex problems that have faced the medical profession during the past decade. When the final story is written, his name will stand high among those wise councilors who have guided us during this troubled time. Your reference committee joins him in reaffirming the recommendation of this Association that a national department of health be created under a director of cabinet rank to coordinate and direct all the various health activities of the government not concerned with the care of the armed forces.

He has drawn a clear distinction between the functions of a public health service concerned with the prevention of disease and that of the practitioner of medicine who is skilled in the treatment of disease in the individual. Your reference committee commends for your consideration his cogent and forceful defense of organized medicine and especially his evaluation of the services rendered by our Board of Trustees and our executive officers. With him your reference committee feels a justifiable pride in the response made by the members of our Association to the call of our government and it affirms its willingness and purpose to devote to the service of our country every resource of our organization.

It has been said that, when the nightingale sings, all the other birds of the forest withhold their notes lest they distort the harmony of the nightingale's song. No words in eulogy of the President's address are needed. The message speaks eloquently for itself. Neither by mere words can your reference committee add any whit to his stature or by neglect detract from your recollection of his outstanding contribution to medicine during his period of office. He is superb in leadership, persuasive in voice, sincere without affectation, tolerant of those who hold honest differences, constructive, advocate and author of safe principles for the guidance of the profession and the establishment of equitable procedures for the distribution of medical care to the underprivileged and unflinching proponent of the best in medicine for a profession which he regards as the best on earth. These qualities, to recite only a few, have endeared him to our membership. While words are inadequate to express your name an expression of highest appreciation for a service superbly performed. The passing year will reveal an ever increasing fold of benefits flowing from his sacrificial services in behalf of American medicine. As he returns to the stethoscope our love goes with him.

3. Address of the President-Elect: Your reference committee is in ready agreement with the President-Elect's commendation of the officers of the American Medical Association for the efficiency exhibited in the management of an institution whose interests are of necessity so broad and so variable. It is recognized that it is through the devoted activities of the full time employees of the Association but no less through the sacrificial services of the officers, councils and committees of the Association working with no thought of monetary reward that the President-Elect is able to voice this just appraisal of the Association's business and scientific management. Your reference committee notes the concern of the President-Elect for the physical welfare of the Association's officers, espe-

cially that of the occupant of the Presidency. It is in sympathy with the humane motive that prompted this observation. All agree that the duties imposed on the President-Elect and the headquarters' officers, but particularly the President, are arduous, exacting and calculated to make serious demands on health and reserve. It is undoubtedly true that, through a recognition of these dangers and the exercise of a more discriminating judgment, calls on the President for official visits to constituent societies could be lessened. Your reference committee is convinced, however, that the spoken word has come to occupy a position of increasing importance in the promulgation of the Association's policies among the members and in the discharge of its civic obligation to the public. The very fact that there is increasing demand by constituent associations for personal visits from the Association's officers is of itself proof of the indispensable nature of the activity. Recognizing that the President-Elect had no thought of suggesting any crippling curtailment of this activity but simply felt impelled, as he says, from observation of the effect of these duties on the health welfare of the occupants of the Presidency to draw attention to its gravity in the hope that wider efforts would be made to minimize the calls made on him, your reference committee draws your attention to this observation confident that it meets your approbation and will have your support. Your reference committee would deemphasize, however, its conviction that judicious use of the headquarters officers and of the President and President-Elect is essential to continued growth of the influence of the Association in professional and public relationships. It believes that the Board of Trustees and the General Manager of the Association can be relied on to weigh this matter and set it in its proper relation, giving due consideration to the interests of both the Association and its officers. Your reference committee therefore suggests that the matter be left in the capable hands of the Board of Trustees for wise consideration.

The President-Elect suggests the advisability of keeping young men coming into the House of Delegates and their placement on important committees in order that through experience they may be prepared to fill vacancies as the older men become inactive. This idea is worthy of support, and your reference committee commends it to your serious consideration. Perhaps it would be wise if constituent associations in the election of alternate delegates would select them from the younger members of their organizations and consider sending them to the annual session of the House of Delegates as observers. Surely they would profit from such nonofficial contacts with the activities of the annual sessions.

Your reference committee desires particularly to record its agreement with the President-Elect's reference to the necessity of subordinating all trivialities and conflicts of opinion to the pressing need of national unity and national preparedness. As the President-Elect has stated, suits, privileges, personalities, personal opinions in the light of the world conflict would best be relegated to a secondary position. In this sentiment your reference committee is in ready agreement and commends it to your thoughtful consideration. The medical profession yielding none of its prerogatives will nevertheless continue to give in this emergency, as it has in past similar crises in our country, its unswerving loyalty to the nation's welfare.

4. Report of Judicial Council: (a) In the report of the Judicial Council attention is called to the lack of uniformity among the several states as to the requirements for membership. While there is no disposition on the part of your reference committee to lay down any rigid requirements as to membership in the various state associations, it is felt that in the interest of families a certain uniformity should be observed since representation in this body is based on the number of physicians recorded as members of the state associations. Your reference committee therefore recommends that the Judicial Council, as a guide to the state associations, draw up recommendations as to the proper basis of membership and define the status of the various classes of members in such associations, and it further recommends that representation in this body be based on the number of active members in each society.

(b) Your reference committee concurs in the opinion of the Judicial Council that controversial matters that may arise in any local society should be reviewed by the grievance committee

of the local society concerned and then by the properly constituted state agency before being referred to the Judicial Council.

(c) Your reference committee concurs in the opinion of the Judicial Council that it would be unwise to grant to any of the specialist groups the right to display special insignia in any form.

(d) Careful consideration has been given by the Judicial Council to the question of representation in this body. At present the total membership of the House is limited to one hundred and seventy-five, divided as follows: one member from each state and territory for each nine hundred and thirty members or fraction thereof, one representative from each of the several sections of the Scientific Assembly, and one representative each from the medical department of the Army, from the medical department of the Navy and from the Public Health Service. With the gradual increase in the number of sections, there has been a corresponding decrease in the proportionate representation of the several states. Furthermore, since the members of the sections are members of their respective constituent state associations, they now have double representation. Your reference committee suggests that the interests of the sections might still be well conserved if they were given a nonvoting status and that a more equitable representation would be effected if state representation was based on a certain fixed number of members or major fraction thereof. At present the proportionate representation of certain of the sections based on their registered attendance is several times as great as that allowed the state societies. Your reference committee feels that all the branches of the government services should be continued on their present basis since their delegates speak in behalf of physicians not otherwise represented. An alternative to this suggested change in the constitution of the House would be through revision of the By-Law which at present limits voting membership to one hundred and seventy-five.

Your reference committee therefore recommends that the Judicial Council consider carefully this whole matter of representation in the House of Delegates with the purpose of devising a fair and equitable basis of representation.

Respectfully submitted.

C. W. ROBERTS, Chairman.
H. G. HAMER.

A. R. MCCOMAS.
WALTER B. MARTIN.

NEW BUSINESS

Resolution on Serologic Tests for Syphilis

Dr. Walter B. Martin, Virginia, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, A number of state laws have been enacted which, under certain conditions, make serologic tests for syphilis compulsory; and

WHEREAS, Standardization of laboratories performing serologic tests under the terms of these laws has become necessary and is being carried out; and

WHEREAS, For biologic and technical reasons there are a considerable number of false positives reported from standardized laboratories; and

WHEREAS, The reporting of false positives may work a grave injustice to certain individuals and result in great suffering; therefore be it

Resolved, That the Board of Trustees of the American Medical Association through an appropriate bureau or committee investigate the problem with special reference to (1) the advisability of such laws, (2) safeguarding the public as far as possible against such false positives and (3) the relative emphasis to be laid on the specificity and sensitivity in establishing criteria for standardization of laboratories under these laws.

Resolution on Establishment of Central Institute for Research in Nervous and Mental Diseases in the United States Public Health Service

Dr. H. A. Luce, Michigan, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, Mental and nervous diseases, including epilepsy, constitute one of the largest, if not the largest, unsolved problems in medicine; and

WHEREAS, There are now on the books of institutions caring for mental diseases and deficiency more than six hundred thousand patients and the states and the federal government spend upward of \$200,000,000 a year for the care and treatment of these patients; and

WHEREAS, Less than 0.5 per cent of this amount is spent for research in these diseases by the states and the federal government; and

WHEREAS, Research into mental and nervous diseases and epilepsy offers possibilities, for decreasing the suffering and expense due to these diseases; and

WHEREAS, Research into nervous and mental diseases and epilepsy has been relatively neglected owing to lack of financial support; therefore be it

Resolved, That the House of Delegates of the American Medical Association approves the principles of the plan that has been advanced to establish in the Public Health Service a central institute to carry on clinical and laboratory research in nervous and mental diseases, and to extend financial aid to outside institutions and agencies to carry on research projects approved by a national council set up to act in an advisory capacity to the institute.

Resolution on Certification in Recognition of Special Qualifications for General Practice

Dr. George R. Dillinger, Indiana, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, There are in existence qualifying boards for the certification of physicians practicing the various specialties; and

WHEREAS, There is no present available method for the qualification and certification of physicians in general practice; therefore be it

Resolved, That the House of Delegates of the American Medical Association authorize the Board of Trustees through its councils or any other agency to give study to the matter of developing standards and means by which certification may be given in recognition of special training, experience and fitness, and special qualifications for general practice.

Resolution on Appeal of British Red Cross for American Physicians

Dr. Thomas A. McGoldrick, New York, presented the following resolution, which was referred to the Reference Committee on Military Preparedness:

WHEREAS, The President of the United States on April 17, 1941 has, as president of the American Red Cross, endorsed the appeal of the British Red Cross for one thousand young American physicians; and

WHEREAS, The American Medical Association, in an editorial in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, has assured Britain of every possible assistance and has supplied the Red Cross with lists of eligible young doctors, thereby endorsing the principle that American physicians be encouraged to volunteer for foreign service; and

WHEREAS, Of the five thousand annual graduates of American medical schools only three thousand, or 60 per cent, are physically acceptable for military service and available to meet the demands of an expanding military establishment, thereby necessitating substantial requisitions from the ranks of those now in private practice in addition to depriving the civil population of 60 per cent of the new graduates; and

WHEREAS, The maintenance of those standards of military and civil health made possible by the thorough education and training of the American physician and now demanded by the people of the United States is vital to the defense of the nation and the welfare of its population; and

WHEREAS, The Medical Society of the State of New York, with these facts in mind, has instructed its delegates to propose that the American Medical Association state its policy with respect to diminution of the reservoir of requisitions of volunteer medical personnel emanating from a foreign source; therefore be it

Resolved, That the House of Delegates instruct the Board of Trustees of the American Medical Association, after appropriate study, to formulate and express through THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION a guiding policy in this matter.

On motion of Dr. John Z. Brown, Utah, seconded and carried, the House recessed at 12:45 p. m.

Tuesday Afternoon, June 3

The House of Delegates was called to order by the Speaker at 2:10 p. m.

The Speaker announced that Dr. Holman Taylor, Texas, had been requested to serve as sergeant-at-arms in place of Dr. A. A. Ross, Texas, who was not in attendance.

On motions, duly made, seconded and carried, attendance at the Executive Session was granted to members of the House of Delegates; officers, trustees and persons allied to the administrative affairs of the American Medical Association; presidents, secretaries, executive secretaries and chairmen of councils of constituent state and territorial medical associations; secretaries and executive secretaries of component county medical societies; the liaison officer, Lieut. Col. Charles G. Hutter; the attorney for the American Medical Association; the secretary of the Canadian Medical Association, and the secretary of the Southern Medical Association.

Executive Session—Tuesday Afternoon, June 3

The Sergeants-at-Arms polled the House, after which the House went into Executive Session at 2:20 p. m., with Dr. H. H. Shoulders, Speaker, presiding.

Report of Board of Trustees

Dr. Arthur W. Booth, Chairman, presented the following report of the Board of Trustees, which was referred to the Reference Committee on Executive Session:

INDICTMENT AND TRIAL OF THE

AMERICAN MEDICAL ASSOCIATION, THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA, HARRIS COUNTY (TEXAS) MEDICAL SOCIETY, WASHINGTON (D. C.) ACADEMY OF SURGERY AND TWENTY-ONE INDIVIDUAL DOCTORS, ALLEGED TO BE MEMBERS AND OFFICERS OF THE AFORESAID MEDICAL ASSOCIATION AND SOCIETIES, IN THE CASE ENTITLED UNITED STATES OF AMERICA VERSUS AMERICAN MEDICAL ASSOCIATION ET AL., DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF COLUMBIA, NUMBER 63221

On Dec. 20, 1938 there was filed in the office of the Clerk of the District Court of the United States for the District of Columbia at Washington, D. C., an indictment by an additional grand jury of the District of Columbia, charging the defendants mentioned in the caption hereof with combining and conspiring together for the purpose of restraining trade in the District of Columbia, in violation of section 3 of the act of Congress of July 2, 1890, known as the Sherman Antitrust Act.

On March 29, 1939 the defendants filed a demurrer to the indictment. The effect of the filing of a demurrer to an indictment is to say that, admitting everything stated in said indictment to be true, no violation of law has been charged.

Written briefs and arguments in support of the demurrer were filed by the defendants, and oral argument thereon was had before the court on various dates. On July 26, 1939 the District Court sustained the defendants' demurrer to the indictment and dismissed the indictment. The District Court filed a written opinion and gave as its principal reason for holding that the indictment did not charge a violation of section 3 of the Sherman Antitrust Law that the practice of medicine was not a trade.

The United States appealed the decision of the District Court to the Court of Appeals of the District of Columbia. While the case was pending in the Court of Appeals of the District of Columbia the United States filed a petition in the Supreme Court of the United States requesting that court to remove the case from the Court of Appeals of the District of Columbia to the United States Supreme Court for decision. The Supreme Court of the United States refused to order the case removed.

Thereafter printed briefs and arguments were filed by both sides in the Court of Appeals of the District of Columbia and in due course oral argument was had before the Court of Appeals. On March 4, 1940 the Court of Appeals filed its decision and written opinion reversing the order of the District Court and ordering that the case be remanded to the District Court for trial. The Court of Appeals in its opinion said that the practice of medicine was a trade.

The defendants filed a petition for certiorari in the Supreme Court of the United States requesting that court to review the decision of the Court of Appeals. The United States in its reply to defendants' petition requested the Supreme Court of the United States not to review the decision of the Court of Appeals at that time on the demurrer but to require the defendants to stand trial and thereafter when all the evidence was in the record to review it if it saw fit to do so. The Supreme Court denied the defendants' petition for certiorari, without an opinion, and as a result the defendants were required to go to trial in the District Court of the United States at Washington, D. C.

On Feb. 5, 1941 the trial began before a jury in the District Court. The trial continued each day until April 4, 1941, when it was concluded. At the conclusion of the evidence for the United States the court directed the jury to return a verdict of not guilty as to Harris County Medical Society, Washing-

ton Academy of Surgery, Dr. Leon Alphonse Martel and Dr. Joseph Rogers Young. At the conclusion of all the evidence the defendants requested the court to direct the jury to find the defendants "not guilty," but the court denied the request and, after instructing the jury as to the law of the case, submitted the case to the jury. The jury found the American Medical Association and the Medical Society of the District of Columbia guilty as charged in the indictment; that is, guilty of combining and conspiring to restrain trade in the District of Columbia. The jury acquitted all of the remaining defendants. Counsel for the two corporations being of the opinion that a verdict which convicted the principal and acquitted the agents through which the principal allegedly acted was a legally impossible verdict, filed motions requesting the court to set aside the verdicts of conviction and discharge the corporations or to grant these corporations a new trial. The court denied these motions on May 29, 1941 and on that day entered judgment on the verdicts against the corporations and assessed a fine against the American Medical Association in the sum of \$2,500 and against the Medical Society of the District of Columbia in the sum of \$1,500.

During the course of the trial the court refused to permit the defendants to prove that Group Health Association, a membership corporation not for profit, organized under the laws of the District of Columbia, received a subsidy of \$40,000 from Home Owners Loan Corporation and other subsidies from private sources; refused to permit the defendants to prove coercion to require employees of various government departments to join Group Health Association; refused to permit the defendants to prove that Group Health Association was guilty of advertising for and soliciting of members; refused to permit the defendants to prove that they had been advised by the best legal talent available that Group Health Association was illegally practicing medicine and engaged in the operation of an insurance company contrary to law, and refused to permit the defendants to prove that Group Health Association and the doctors employed by it were violating the Principles of Medical Ethics of the medical profession. The principal reason given by the court for refusing to permit the defendants to make the aforesaid proof was that even if Group Health Association was violating the law that fact would not authorize or warrant the defendants violating the law in an effort to restrain them and that therefore the proof was immaterial. The court seemed to be of the opinion that if the activities of Group Health Association were contrary to law it was the duty of the public prosecutor to prosecute them and not the privilege of the defendants to attempt to restrain them.

The court submitted to the jury for its determination as a question of fact whether the defendants combined or conspired to restrain trade in the District of Columbia unreasonably and the jury found the two corporations guilty. The court has refused to set the verdicts aside.

The Board of Trustees has been advised by counsel for the American Medical Association that new and novel questions of law are involved in this case and that there is a fair chance that the Court of Appeals of the District of Columbia will decide that the District Court committed reversible error in many of its rulings on the evidence, in refusing to permit the defendants to make proof as hereinbefore stated, in denying the motions of the defendants to direct a verdict in their favor, in certain instructions which it gave to the jury and in denying the motions of the defendants to set aside the verdict of the jury finding the two corporations guilty when the jury had found all the alleged agents of the corporations not guilty. Counsel for the American Medical Association further advise that even should the Court of Appeals refuse to reverse the various rulings of the trial court and grant a new trial there is a fair chance that the Supreme Court of the United States will reverse the previous ruling of the Court of Appeals that the practice of medicine is a trade or will hold that the defendants are in the same class as labor unions and not subject to the provisions of the Sherman Antitrust Law or will hold that the evidence fails to show that the defendants combined and conspired to restrain trade or will hold that the trial court committed reversible error in its rulings during the course of the trial or in its instructions to the jury.

The Board of Trustees recommends to the House of Delegates that counsel for the American Medical Association be requested and directed to appeal the judgment based on the verdict of guilty against the American Medical Association in the case of *United States v. American Medical Association et al.*, District Court of the United States for the District of Columbia, number 63221.

In submitting this report, the Chairman of the Board of Trustees discussed to some extent the possibilities concerning the nature of future developments with respect to the case of the United States versus the American Medical Association et al.

Dr. Booth, on request of the Speaker, presented to the House Mr. E. M. Burke, counsel for the American Medical Association, who outlined the situation with respect to this case.

After discussion, this report of the Board of Trustees, which had been referred to the Reference Committee on Executive Session, was considered by the entire House in executive session, on motion of Dr. Thomas A. McGoldrick, chairman of that reference committee, seconded by Dr. George W. Kosmak, New York, and carried.

Dr. Holman Taylor, Texas, moved that the House of Delegates heartily approve and commend this report of the Board of Trustees, and the motion was duly seconded.

Dr. T. K. Gruber, Michigan, moved that Dr. Taylor's motion be amended by adding to it the statement that the Board of Trustees be instructed by the House of Delegates to direct counsel for the American Medical Association to appeal the judgment, based on the verdict of guilty, against the American Medical Association in the case of *United States v. American Medical Association et al.*, District Court of the United States for the District of Columbia, number 63221, and the amendment was accepted by Dr. Taylor and his second.

After discussion, Dr. Taylor's motion as amended was carried by a rising vote, there being not one dissenting vote.

Report and Supplementary Report of Reference Committee on Military Preparedness

Dr. Harvey B. Stone, Chairman, presented the following report of the reference committee:

1. Resolution on Medical Examination of Draftees: The following resolution was considered by your reference committee after a full hearing:

WHEREAS, The Committee on Distribution of Medical Care is fully cognizant of the present national emergency and the request of the federal government to participate in the national defense program, and the usual willingness of physicians to cooperate has been exemplified during the past eight months; and

WHEREAS, The medical profession is still willing to cooperate in this program; and

WHEREAS, The workers on all other government projects are fully compensated for their efforts; and

WHEREAS, The examiners for National Youth Administration, Civil Service and Recruiting Service are compensated for their services; and

WHEREAS, The work of examining draftees requires a great expenditure of time and effort on the part of the examining physician as well as actual cash expense; and

WHEREAS, It appears that this program will continue indefinitely and perhaps permanently; therefore be it

Resolved, That the Committee on Distribution of Medical Care recommends to the Executive Committee of the Council of the Michigan State Medical Society, that it instruct the delegates of that society to the American Medical Association to present on the floor of the House of Delegates of the American Medical Association in 1941 this problem in order that a procedure may be established for compensating the local advisory and draft board examiners for their physical examination of draftees.

Communication Concerning Uncompensated Services Rendered by Physicians to the Selective Service: The following communication was also considered by your reference committee at the time it considered the Resolution on Medical Examination of Draftees:

At a recent meeting of the Arkansas Medical Society, communications from different sections of the state were presented protesting the uncompensated services being rendered by physicians to Selective Service.

It is not unusual for a physician in this capacity to be asked to examine from six to ten men in one day, using his own office and office equipment and taking the time that often his pay patients want. Thus he is not only donating his services but also paying for the privilege of doing so in lost fees.

In the districts of some advisory boards no "specialists" in eye, nose and throat, etc., reside and draftees are sent to medical advisory boards in other districts for such examinations, thus requiring the physicians on such boards to do the work not only from their own district but from other districts as well.

Selective Service is functioning more nearly perfectly than any other branch of the preparedness program, and no small share of the honor for its success is due to the work of physicians.

We have a communication from one who has discussed this matter with the Committee on Military Affairs of the House of Representatives in Congress, which says "this condition exists largely because of the fact that various medical associations agreed on behalf of their members to perform this service free of charge as a patriotic contribution to the defense program." If this is true, we feel sure that the heads of "various medical associations" made such an agreement without giving serious thought as to the time and financial loss required of the physicians who do the work.

We feel that any action asking for an adjustment of this condition should come from organized medicine and we are therefore appealing to the American Medical Association asking that such action as is deemed expedient be taken to call to the attention of the War Department the amount of work now being done by physicians gratis and ask a correction of the injustice by (1) giving remuneration to the physicians who serve as examining physicians and medical advisory board members for actual time employed, making it retroactive to include work already done, or (2) equipping an office in each local board office, or county or district and furnishing a full time medical officer who would do all the examining. This would not necessitate a medical officer for each board as one medical officer could serve several boards.

S. J. ALLBRIGHT, M.D. }
L. T. EVANS, M.D. } Special Committee.
C. E. DUGAN, M.D. }

ARKANSAS MEDICAL SOCIETY.

Since there are many laymen, many more in fact than physicians, serving the Selective Service in various capacities without payment, who comprise the members of the local boards, the appeals boards, the government appeals agents and others in ancillary capacities, it would be against the adopted policy of the American Medical Association to recommend that physicians serving these local boards be paid, because the American Medical Association has pledged its utmost service to the government in behalf of the national defense program. To pay the physicians would make these positions political in intent and practice.

Your reference committee therefore recommends that at the present time the resolution and request in the communication be disapproved.

2. Resolution on Eligibility of Women Physicians and Surgeons for Medical Reserve Corps: The following resolution was considered after a full hearing:

WHEREAS, The United States of America is at present engaged in a vast preparedness program which includes a listing of members in the Medical Reserve Corps available for active service; and

WHEREAS, There are approximately eight thousand women physicians and surgeons in the United States, and women physicians and surgeons of America demonstrated their fitness for wartime service during the first World War when they financed units and staffed hospitals with well trained officers, in France and Serbia; and

WHEREAS, The United States government has to date taken no cognizance of these women physicians in time of national emergency; and

WHEREAS, The government has already granted women nurses Army rating with proper rank, pay, and war-risk insurance; and

WHEREAS, The Medical Society of the State of New York has gone on record recommending that the women physicians and surgeons of America be made eligible for the Medical Reserve Corps of the United States Army and Navy and be granted full privileges thereof; therefore be it

Resolved, That the American Medical Association go on record to this effect, and that a request go to the Surgeon General of the Army and the Navy to make women physicians and surgeons of the United States eligible for the Medical Reserve Corps of the Army and the Navy with full privileges thereof.

The hearing developed the fact that legislation by Congress would be required to effect this change in the qualification of medical reserve officers by amending the present law and adding "female" to the present legal qualifications for a commission in the Medical Reserve Corps. After hearing from the representatives of the Surgeon General of the Army and listening to other statements, this reference committee feels that it would not be to the best interests of the defense program to advocate legislation at this time. In addition to the changes in regulations and laws, it would demand reconsideration of the program for construction of military hospitals in addition to changes in the plans for housing of officers. This would hamper and immediately throw into confusion existing procedures under which the medical aspects of the defense program are developing. From a larger point of view the necessary absence of so many male physicians from civilian areas will give opportunity to eight thousand women physicians for a full task and make theirs a valuable patriotic contribution should they focus their activities on service to the civilian population. Moreover, they may apply for positions in the U. S. Public Health Service, in which many vacancies exist and in which their services can be utilized without resort to legislation.

Your reference committee therefore recommends that the propositions advocated in the resolutions from the delegations from New York and Pennsylvania be disapproved at this time.

3. Resolution on Patriotic Services of Native American and Foreign Born Physicians: The following resolution concerning refugees from foreign lands, who for the most part have first citizenship papers, received sympathetic attention and consideration from your reference committee:

WHEREAS, The regulations for the granting of commissions in the armed forces of the country exclude foreign born physicians and also to an extent native American doctors who are graduates of foreign medical schools; and

WHEREAS, These regulations thus enforced work an undue hardship on the patriotic native members of our profession who leave their homes, institutional positions and private practices to perform full military duty, thus placing their civilian status and practice in the hands of those to whom the high privilege of service is denied by the aforesaid regulations; and

WHEREAS, There may be found places where these foreign born physicians may serve the country, which would in no way be considered by proper authority as "key positions," and such service in such non-key positions would not entail any risk to the security of our national defense; and

WHEREAS, The house of delegates of the Medical Society of the State of New York has instructed its delegation to the House of Delegates of the American Medical Association to present these facts for consideration and action; therefore be it

Resolved, That the American Medical Association make proper representation to the federal authorities concerned with these matters to the end that the patriotic contributions of military service by native American physicians, graduates of grade A medical schools, be not a handicap to them, throughout and after their period of service, by the loss of their practices and hospital associations because these were taken over by the men from whom the privilege to serve the government is withheld.

The Surgeon Generals of the Army and Navy are debarred by regulations from granting commissions to foreign physicians. It is comprehended that their presence in the civilian community constitutes a handicap not only to our native physicians who are called on to serve but in many instances to these newly adopted citizens who are desirous of proving their entire devotion to this country, whose open handed hospitality has sheltered them from oppression. Your reference committee feels that this subject has many aspects which need more study to the end that proper disposition may be made of these physicians from foreign shores who are recently arrived among us and recommends that this matter be referred to the Committee on Medical Preparedness of the American Medical Association, with the hope that some type of service may be found wherein these men may serve this government without necessarily being commissioned as medical officers in our armed forces.

4. Resolution on Continuation of Supply of Well Trained Medical Graduates: The following resolution was thoroughly discussed:

WHEREAS, The experience of belligerent nations in the World War and in the present conflict amply demonstrates the necessity of insuring a continuing supply of well trained medical graduates; and

WHEREAS, There will probably be a shortage of medical men necessary for the proper functioning of the military services and for the care of the civilian population; and

WHEREAS, The United States Army in 1917-1918 permitted medical students in active military service to be transferred to the reserve for the purpose of completing their medical course; and

WHEREAS, A number of medical students were already inducted into service before the issuance of the recent Selective Service regulations authorizing deferment of medical students and premedical students already matriculated in medical schools; and

WHEREAS, The Medical Society of the State of New York, with these facts in mind, instructed its delegates to the American Medical Association to introduce a resolution memorializing the Surgeon General of the Army to give consideration to medical students already inducted into active service in the present emergency; therefore be it

Resolved, That the American Medical Association memorialize the proper military authorities and the Director of Selective Service to release those medical students already inducted into service and enable them to return for completion of their medical studies.

Information at hand shows that exceedingly few medical students have been inducted into the army. The deferment of medical students and premedical students who have successfully completed their courses is already being provided for by the national Selective Service System. Your reference committee feels that it is a matter requiring continuing study and observation to watch the effects of the recommendations of the national Selective Service System on the local boards throughout the country and that any action at this time would be

1. There is no record in the official minutes of the presentation to the House of a resolution from Pennsylvania on this subject.

premature, particularly since the trend of the attitude of the War Department and the national Selective Service System is definitely toward the conservation of medical talent and the encouragement of the continued pursuance of premedical and medical courses as occupations in the interest of the safety and health of the nation.

Your reference committee therefore recommends that no action be taken on this resolution at this time, and that the resolution be tabled.

Respectfully submitted.

HARVEY B. STONE, Chairman.

JAMES E. PAULLIN.

SAMUEL J. KOPETZKY.

SAM E. THOMPSON.

JOHN H. O'SHEA.

E. H. SKINNER.

JOSEPH F. SMITH.

Dr. Stone then presented the following supplementary report of the reference committee:

Resolution on Appeal of British Red Cross for American physicians: A resolution from New York State introduced at the end of this morning's session concerns the attitude of the American Medical Association toward the sending of volunteer medical personnel for service with foreign nations. It recommends that the House of Delegates authorize the Board of Trustees of the American Medical Association after appropriate study to formulate and express through THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION a guiding policy in this matter. The chairman of your reference committee reports that it has been impossible to arrange a formal meeting of the committee to consider this matter, but that five of the members personally have approved of the resolution and it is therefore recommended that the resolution be adopted.

HARVEY B. STONE, Chairman.

On motions of Dr. Stone, duly seconded and carried, each of the four sections of the report of the reference committee was adopted after discussion.

Dr. Stone moved the adoption of the supplementary report of the reference committee, and the motion was seconded by Dr. Arthur T. McCormack, Kentucky. After discussion, the House adopted a motion, duly seconded and carried, to amend the supplementary report of the reference committee to indicate that the resolution referred to in it should be adopted with the omission of the "whereases." The supplementary report of the reference committee as amended was then adopted.

On motion of Dr. Stone, seconded by Dr. H. B. Everett, Tennessee, and carried, the report and the supplementary report of the reference committee as amended were adopted as a whole.

Vote of Appreciation

On motion of Dr. James Q. Graves, Louisiana, seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and Dr. Thomas K. Lewis, New Jersey, and carried, a rising vote of appreciation was extended to Mr. E. M. Burke.

It was moved by Dr. R. W. Fouts, Nebraska, seconded by Dr. George W. Kosmak, New York, and carried, that the House rise from executive session and continue in regular session.

The executive session adjourned at 4:35 p. m.

Tuesday Afternoon (Continued)

The House reconvened in regular session at 4:35 p. m. with Dr. H. H. Shoulders, Speaker, presiding.

Proposed Amendment to Constitution

Dr. William R. Molony Sr., California, in behalf of Dr. E. H. Cary, Texas, presented the following proposed amendment to the Constitution, which must lie over for consideration at the annual session of the House in 1942:

WHEREAS, The Board of Trustees of the American Medical Association was set up at a time when numerically the Association was approximately one-third its present strength; and

WHEREAS, Because of the great variety of conditions existing throughout the country, largely because of geographic and population problems, it seems desirable to provide a greater spread of membership for the Board, even though it is not at all a matter of representation in the sense that the House of Delegates is a representative body; therefore be it

Resolved, That article 6, section 1 of the Constitution of the American Medical Association be amended by substituting the word "eleven" for the word "nine" as the last word of the fourth line of that section, so that article 6, section 1, will then read: "SECTION 1.—The general officers of the Association shall be a President, a President-Elect, a Vice President, a Secretary, a Treasurer, a Speaker and a Vice Speaker of the House of Delegates, and eleven Trustees"; and be it further

Resolved, That article 6, section 1 of the Constitution of the American Medical Association be amended to read as follows:

"SEC. 3.—Two Trustees shall be elected annually except every fifth year, when three shall be elected, each to serve for five years; or until his successor is elected and installed: Provided, that at the session of the House of Delegates at which this amendment is adopted three Trustees shall be elected to serve five years and one to serve four years. No Trustee shall serve for more than two consecutive terms, but a Trustee elected to serve an unexpired term shall not be regarded as having served a term unless he has served three or more years."

Report of Reference Committee on Hygiene and Public Health

Dr. Arthur T. McCormack, Chairman, presented a report, which as amended reads:

Your reference committee has read, with interest, the report of the Council on Medical Education and Hospitals in regard to medical students and interns and recommends that this portion of the report of the Council be approved and that the deans of medical schools and the staffs of approved hospitals provide for regular health examinations and annual reexaminations for all medical students and interns.

Respectfully submitted.

ARTHUR T. MCCORMACK, Chairman.
WARREN F. DRAPER.
LEWIS B. BATES.
L. W. LARSON.
WILLIAM D. JOHNSON.

It was moved by Dr. McCormack and seconded by Dr. Fred-eric E. Sondern, New York, that the report of the reference committee be adopted. On motion of Dr. R. W. Fouts, Nebraska, duly seconded and carried, the word "annual" was inserted before "reexamination" in the last sentence. The report as amended was then adopted.

Appreciation of American Medical Women

Dr. Harry H. Wilson, California, moved that the House go on record as applauding and appreciating the spirit of the American medical women in offering services to the United States government, and the motion was seconded by Dr. Arthur T. McCormack, Kentucky, and Dr. Walter E. Vest, West Virginia, and adopted unanimously.

On motion of Dr. Edward M. Palette Sr., California, duly seconded and carried, the House recessed at 4:45 p. m. to reconvene at 1 p. m., Thursday, June 5, 1941.

Third Meeting—Thursday Afternoon, June 5

The House of Delegates was called to order at 1:05 p. m. by the Speaker, Dr. H. H. Shoulders.

Report of Reference Committee on Credentials

Dr. G. Henry Mundt, Chairman, stated that a total of 171 delegates had been seated.

Roll Call

The Secretary called the roll and announced that more than a quorum had responded.

Presentation of the Minutes

It was moved by Dr. Arthur T. McCormack, Kentucky, seconded by Dr. E. G. Wood, Tennessee, and carried, that the House dispense with the reading of the minutes.

Report of Board of Trustees

Dr. Arthur W. Booth, Chairman, presented the following report, which was adopted on motions duly seconded and carried:

1. Resolution Authorizing Establishment of a Health Exhibit for the Public at Cities Where Annual Sessions are Held: The Board of Trustees is in full sympathy with the objectives of the California Medical Association in stressing the importance of the education of the general public in problems of health and sound principles of medical practice by the use of exhibit material. It has on several occasions devoted consid-

erable time to the question of how exhibit material such as appears in the Scientific Exhibit at the annual sessions might be utilized. However, after careful consideration the utilization of this material has not been found feasible, for several reasons: i. e., the material belongs to the exhibitors, and most of it is not pointed suitably toward the lay public; it is scientific in nature and would not be practical for use for public education unless some one was in attendance to explain it. It is indeed doubtful that the exhibitors would go to the city at which an annual session is held a week in advance of the session or remain a week after its close to demonstrate to the public, but, if they agreed to do so, their expense would have to be defrayed.

The Academy of Medicine of Cleveland has provided a health exhibit during the meeting of the American Medical Association, and the Bureau of Exhibits in the headquarters office has furnished material for exhibits in various parts of the country. The advantages of permanent health exhibits are well recognized. Such exhibits are maintained in Chicago, New York, Pittsburgh, Cleveland, and Rochester, N. Y.

The Board will be glad to bear in mind the desirability of fostering such exhibits as opportunity is offered.

2. Resolution Requesting Appointment of Committee to Confer with Specialty Boards: Concerning the resolution with regard to specialty boards, the Board of Trustees feels that this is a matter that cannot be acted on precipitately. The Board will study the records, develop all the facts by proper conferences, in cooperation with the Council on Medical Education and Hospitals and the Specialty Boards, and will try to work out a plan for presentation later to this House.

Respectfully submitted.

ARTHUR W. BOOTH, Chairman.

Report of Reference Committee on Medical Education

Dr. Walter G. Phippen, Chairman, presented the following report, which was adopted on motion of Dr. Phippen, seconded by Dr. Arthur T. McCormack, Kentucky, and carried:

Your Reference Committee on Medical Education held a hearing to consider the supplementary report of the Council on Medical Education and Hospitals regarding the essentials of an acceptable school for clinical laboratory technicians. Members of the Council appeared before it as did many others who were interested in the subject, and the essentials were thoroughly discussed and changed in some respects by your reference committee to read as follows:

ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR CLINICAL LABORATORY TECHNICIANS PREAMBLE

Two organizations are primarily concerned with the training of clinical laboratory technicians: the Council on Medical Education and Hospitals of the American Medical Association and the Board of Registry of Medical Technologists of the American Society of Clinical Pathologists. The Council functions by inspecting, reporting and approving these schools, while the Board of Registry investigates and certifies the competence of the technicians.

The Council, with the cooperation of the Board of Registry, has promulgated standards for this type of training for the information of physicians, hospitals, prospective students and others and for the protection of the public.

Technicians are being trained in these schools to work under the direction of qualified physicians and not as independent practitioners of laboratory work.

I. ADMINISTRATION

1. Acceptable schools for training laboratory technicians may be conducted by general hospitals or state health laboratories affiliated with hospitals where the majority of the student's practical training is received. This arrangement should not discourage affiliations between the hospital and universities, colleges, public health laboratories or other hospitals.

2. All training of technicians shall be under competent medical control.

3. Resources for continued operation of the school should be insured through regular budgets, gifts or endowments but not entirely through students' fees. Experience has shown that

commercial schools operated for profit frequently do not adhere to proper ethical and educational standards and therefore are not acceptable.

II. ORGANIZATION

1. Adequate space, light and modern equipment should be provided in the laboratory department. A library containing up to date references, textbooks and scientific periodicals pertaining to clinical laboratory work and pathology should be maintained or be readily accessible in the institution.

2. Satisfactory record systems should be provided for all work carried on in the department. Monthly and annual classifications of the work of the department should be prepared.

3. Transcripts of high school and college credits and other credentials must be available. Records should be kept of each student's attendance and grades as well as of the number and type of tests performed. In addition a synopsis of the complete curriculum should be on file in the office of the laboratory director. This curriculum should include the rotation of assignments, the outline of instruction supplied by the laboratory and a list of the prepared specimens which are used to augment the experiences of the student.

4. At least two or more students should be enrolled in each class. Approval is automatically withdrawn if a school does not have any students for a period of two years, unless a satisfactory reason for this is given.

III. FACULTY

1. The school should have a competent teaching staff. The director must be a graduate in medicine who holds the certificate of the American Board of Pathology or who has had the equivalent in training and experience. He should take part in and be responsible for the actual conduct of the training course. He should be in daily attendance for sufficient time to supervise properly the laboratory work and teaching.

2. In laboratory practice the enrolment should not exceed one student to each member of the teaching staff. The staff should include not less than one salaried instructor who is a registered technician or eligible for registration, in addition to the laboratory director. In order to be considered as an instructor, a technician must have had three years of experience, while members of the hospital staff or visiting instructors must have regular assignments that cover a complete course prescribed in the Essentials.

IV. PREREQUISITES FOR ADMISSION

Candidates for admission should be able to satisfy one of the following requirements:

(a) Two years of college work, including chemistry and biology at an accredited college or university. After Jan. 1, 1943 this requirement shall read: Two years of college work, including general chemistry, quantitative chemistry, and biology at an accredited college or university. Bacteriology may be substituted for biology. Organic chemistry and physics are highly recommended.

(b) Graduation at a school of nursing recognized by the state board of nurse examiners and, in addition, college chemistry. After Jan. 1, 1943 requirements for nurses shall include one year of college work, thirty semester hours (forty-five quarter hours) including courses in chemistry and biology.

V. CURRICULUM

1. The course of training should be not less than twelve months in duration and should include the following subjects: biochemistry, hematology, bacteriology, parasitology, histology and serology. The training should also include a course in record keeping.

2. The instruction should follow a planned outline similar to the Model Curriculum of the Board of Registry of Medical Technologists and should be accomplished by text assignments, lectures or informal discussions, demonstrations, supervised practice, quizzes and written, oral and practical examinations.

VI. CLINICAL MATERIAL

Each student should receive practice training, adequate in kind and amount, under competent supervision, in a hospital laboratory. The hospital should be registered and be otherwise acceptable to the Council on Medical Education and Hos-

pitals of the American Medical Association and have a minimum of two thousand yearly admissions. A sufficient amount of clinical material should be available to permit the student to comply with the requirements of the Board of Registry. If the hospital is not able to supply all this material through its routine tests and examinations, artificial mediums should be provided.

VII. ETHICS

1. Exorbitant fees and commercial advertising should be considered unethical.

2. Schools conducted primarily for the purpose of substituting students for paid technicians will not be considered for approval.

Respectfully submitted.

WALTER G. PHIPPEN, Chairman.

ELBRIDGE J. BEST.

CARL R. STEINKE.

LOUIS A. BUE.

WINGATE M. JOHNSON.

Report of Reference Committee on Legislation and Public Relations

Dr. Henry A. Luce, Chairman, presented the following report, which, on motions of Dr. Luce, duly seconded and carried, was adopted section by section and as a whole:

1. Report of Committee on Legislative Activities on Senate and House Bills Indicated: Your reference committee wishes to note that portion of the report on S. 1230 with its reference to sectarian medicine. This was condemned at the New York session last year and your reference committee recommends a reaffirmation of the action then taken; namely, "Your reference committee believes that the reference to osteopathic representation on the council is entirely unwarranted and should be eliminated from the bill."

H. R. 4476, which, as amended, contains similar reference to sectarian participation, is likewise placed by your reference committee in the same category.

Referring to the \$150,000,000 Lanham bill, known as H. R. 4545, which provides for the construction of public works made necessary by the national defense program, including the construction of hospitals and other facilities for the care of the sick, your reference committee commends the action of the Committee on Legislative Activities in calling attention to the necessity of exercising constant vigilance to the end that no feature objectionable to public health be instigated.

2. Report of Committee on Legislative Activities on Farm Security Administration Policies: Regarding the Farm Security Administration policy of arriving at understandings with constituent state medical societies as arranged by Dr. R. C. Williams, chief medical officer, prior to making contracts, this procedure is in line with good public policy and in harmony with recommendations of the American Medical Association. For this activity on the part of Dr. Williams, your reference committee wishes to express highest approval.

Your reference committee wishes to call attention to that portion of the report of the Committee on Legislative Activities which reads: "Your committee has had called to its attention a new plan proposed in Oregon which involves creation of corporations controlled by laymen clients of the Farm Security Administration whose stockholders receive benefits of medical care. While the present limitation of participating stockholder to the Farm Security Administration clients does not change the present practice so far as medical benefits are concerned, your committee deplores any development called to its attention which would permit later amendment of the by-laws of the corporation to include other than Farm Security Administration clients contrary to the principles of the American Medical Association and the expressed policies of the Farm Security Administration to cooperate fully with state and county societies through unincorporated groups."

Your reference committee disapproves of the development of any plan whereby nonmembers of the Farm Security Administration can be included in the development of any plan not approved by constituent state medical societies.

Your reference committee notes with pleasure the report of the rehabilitation work done under the supervision of

Dr. Williams. Any attempt to restore health and self respect to American families and to preserve individuality, independence and security is to be commended.

Your reference committee is impressed with the problems presented by migrant individuals in various sections of the country as well as with the "mushroom" communities incident to the erection of defense industries. Awareness of potentially dangerous conditions is essential. It recommends that state and local medical societies become alert to their responsibilities and anticipate the public health problems therein involved.

In conclusion your reference committee quotes, with emphasis, the final paragraph of the report of the Committee on Legislative Activities: "Your committee concludes this report by appealing to a unified profession to continue its interest in the attitude of its own representatives in Congress so that any sound program can be supported and any program which makes undue inroads into the private practice of medicine can be opposed."

Respectfully submitted.

HENRY A. LUCE, Chairman.
F. J. PINKERTON.
JOHN H. FITZGIBBON.
TERRY M. TOWNSEND.
F. S. CROCKETT.

Report of Reference Committee on Miscellaneous Business

Dr. Charles G. Strickland, Chairman, presented the following report:

Your reference committee's meeting room was simply crowded with observers and participants on Tuesday afternoon. Your reference committee was most pleased and gratified at the interest shown in its proceedings and wishes to thank all who took the trouble to attend. It was a grand but always a good natured riot.

1. Resolution on Hospital Privileges for General Practitioners: You will remember this resolution, which was presented to the House of Delegates, referred to this reference committee and referred back to this reference committee for further consideration. Your reference committee has now given further consideration to the matter and believes that the resolution, and particularly its preamble, as drawn, contains too much controversial material to warrant the requested transmission by this House of Delegates. It further believes that in the present form the resolution fails to accomplish the purpose of its sponsors and therefore recommends that this resolution be returned to the Michigan State Medical Society for further consideration and revision.

2. Resolution on Serologic Tests for Syphilis: Your reference committee is informed that a tremendous amount of work has been done on this subject by the U. S. Public Health Service, all of which is in printed form and available on application to the proper authorities. Dr. Parran has made for himself an international reputation on the subject of syphilis. He has associated himself with advisory commission after advisory commission, made up of men most expert in all phases of syphilis, and their findings are a matter of record and available on request. Under these circumstances, your reference committee has no alternative except to recommend that this resolution be rejected.

3. Resolution on Certification in Recognition of Special Qualifications for General Practice: Your reference committee feels that this resolution carries the certification idea a bit too far. Once a medical graduate has passed his state or national board and has been licensed to practice, he is to all intents certified for general practice. From there on, unless he aspires to specialization, recognition must come from the reputation he builds and the place he makes for himself in the hearts of his loyal patients and in his own community. What can empty honors mean to him or a certification which means little and achieves less? After all, is not a good general practitioner the grandest thing in the world of medicine anyway?

Your reference committee has become aware that certification boards are becoming a sore spot in our medical body. It believes that certification boards have their proper place and function, but evidence of unnecessary irritation among the rank and file is becoming evident. It hopes that the House of Dele-

gates will not feel that this reference committee is exceeding its functions if it suggests that the Council on Medical Education and Hospitals may have made a mistake in permitting the specialty boards to slip out from under the control and jurisdiction of the American Medical Association. Perhaps it is not too late, by proper contact methods, to reestablish such control. Meanwhile your reference committee regrets that it cannot recommend for approval the resolution suggesting a certification board for general practitioners.

4. Resolution on Establishment of Central Institute for Research in Nervous and Mental Diseases in the U. S. Public Health Service: Dr. Draper of the Public Health Service attended your reference committee's hearing and explained the plan of the U. S. Public Health Service in detail. This service is authorized to study diseases of mankind.

An eminent advisory council has advised of the need of research in mental and nervous diseases. According to the plan, the Surgeon General proposes to request an appropriation from Congress to finance this research. If such funds are appropriated, the Surgeon General, with the aid of a National Advisory Research Council, proposes (1) to establish a special pavilion in connection with St. Elizabeth's Hospital, Washington, D. C., to care for 200 mental and nervous patients. These patients will be selected from individuals already eligible for government care; (2) to establish the necessary laboratories—biochemical, biologic and pathologic; (3) to make certain grants for private research; (4) to establish certain fellowships, and (5) to act as a coordinator of this research and as a library of results obtained.

It is only fair for your reference committee to remind the House that a similar resolution was defeated at the 1940 session. So far as can now be determined, the cause of this defeat was that (1) the resolution was brought before the House in the final session and consequently had not been studied in detail by a reference committee, and (2) there was in the minds of some delegates a doubt as to the propriety of using government funds for such a purpose. Notwithstanding the action taken at the 1940 session, your reference committee, after careful study, recommends the approval of the resolution as now submitted.

Respectfully submitted.

CHARLES G. STRICKLAND, Chairman.
FREDERIC E. SONDERN.
HOLMAN TAYLOR.
CHARLES E. KIELY.
ANDREW F. MCBRIDE.

The recommendations contained in the first three sections of the report of the reference committee were adopted, on motions of Dr. Strickland, duly seconded and carried.

Dr. Strickland moved the adoption of the fourth section of the report recommending the approval of the establishment of a central institute for research in nervous and mental diseases in the U. S. Public Health Service, and the motion was seconded by Dr. Arthur T. McCormack, Kentucky. After discussion, it was moved by Dr. D. F. Cameron, Indiana, that this section of the report of the reference committee be laid on the table. The motion was seconded by Dr. Arthur J. Bedell, Section on Ophthalmology, and carried.

On motion of Dr. Strickland, seconded by Dr. Robert E. Schlueter, Missouri, and carried, the report of the reference committee with the exception of the fourth section which was tabled was adopted as a whole.

Report of Reference Committee on Executive Session

Dr. Thomas A. McGoldrick, Chairman, presented the following report, which was adopted section by section and as a whole on motions of Dr. McGoldrick, duly seconded and carried:

1. Report of Committee on Legislative Activities Dealing with Veterans' Hospitals: Your reference committee reaffirms the belief that no hospital should be created nor any present one expanded under the Veterans' Administration Act unless there is proved need for such facility in the community, and that need should be determined after consultation of the government representatives with the medical profession in the area of the proposed project.

Your reference committee urges that the committee of this association in charge of the subject of Veterans' Hospitals and

care, despite the difficulties of opposition, continue its watchfulness and reports.

2. Report of Council on Foods and Nutrition Dealing with the National Nutrition Conference for Defense: Your reference committee believes that the resolution contained in this report should be approved.

3. Resolution Requesting Establishment of Procurement and Assignment Agency: Your reference committee agrees that the establishment of such a central authority will facilitate the work of the Committee on Medical Preparedness and will enable the government to select more promptly and more wisely those physicians necessary for military, civilian and industrial service.

4. Statement on Training of Physicians: Your Reference Committee on Executive Session approves this statement on the training of physicians prepared by the joint conference of the Committee on Medical Preparedness and the Council on Medical Education and Hospitals of the American Medical Association and recommends its transmission to the Secretary of War and to the Surgeon General of the Army.

5. Report of Committee on Medical Preparedness: With the printed report of the Committee on Medical Preparedness in the hands of each delegate and filed with this Association, your reference committee feels that the amount of work therein recorded, the quality of it, the thoroughness and the value thereof are apparent to all and need here no further words of appreciation. The report itself tells of the several meetings of the committee composed of members from different parts of this country, of the conferences held with chairmen of state and county committees on medical preparedness, of conferences with government officials of the Army, the Navy, the Public Health Service and the Selective Service System and with members of the Board of Trustees of the American Medical Association. Many of these conferences were held in Washington, D. C., and at the Association's offices in Chicago.

Your reference committee notes the number of questionnaires distributed to doctors of this country—one hundred and eighty thousand—and the number returned, approximately one hundred and fifty thousand—which have been studied, classified and filed. The cards of these questionnaires make the basic information immediately available and of great assistance to the government when needed for military or civilian service.

Your reference committee especially approves the resolutions forwarded to the federal government urging that arrangements be made under which our medical schools could continue to operate to the highest possible advantage; that medical students, interns and residents be permitted to complete their training in hospitals, and that neither essential teaching personnel nor student bodies be depleted to an extent that would interfere with the production of an adequate supply of well trained graduates each year.

Many of the changes which have already been made in the regulations of the Selective Service Act have undoubtedly been the result of the influence of this Committee on Medical Preparedness.

In addition to other duties, the Committee on Medical Preparedness has kept its eyes on legislation in Congress bearing on medical aspects of national defense and on the standing of pending bills and the possible effects of their enactment.

Your reference committee heartily agrees with the Committee on Medical Preparedness in its appreciation of the valuable assistance rendered by the liaison officer of the Medical Corps, Lieut. Col. Charles G. Hutter, M. C., U. S. Army, namely, Colonel Hutter has won the respect and the esteem of all who have been associated with him.

The report of the Committee on Medical Preparedness indicates the fulfillment of those promises made by the House of Delegates at the 1940 session in New York and the assurance to the government of continued complete support and cooperation.

Respectfully submitted.

THOMAS A. MCGOLDRICK, Chairman.
DEERING G. SMITH.
E. S. HAMILTON.
E. G. WOOD.
JAMES R. MILLER.
C. H. HENNINGER.

Address of Dr. Miguel Acuna

The Secretary stated that he had a communication from the Secretary-General of the Chilean Medical Association announcing the appointment of Dr. Miguel Acuna as its official representative to the annual session of the American Medical Association, as well as a letter from the Honorable R. Michel, Chilean Ambassador.

The Secretary, on request of the Speaker, conducted Dr. Miguel Acuna to the platform, after which Dr. Acuna addressed the House as follows:

Mr. President, Mr. Speaker, Members of the House of Delegates: It is a great honor for me to thank you for the cordial invitation received from the American Medical Association to attend the Ninety-Second Annual Session in Cleveland.

The Chilean Medical Association, informed about this invitation, has conferred on me its official representation.

The great development of American medicine is well known and admired in my country. With special sympathy we have witnessed how you have become leaders in the world. Naturally, we hope to have the opportunity to meet American medical men and to know their institutions at first hand.

It is a privilege for me to have visited, during the last eight months, various medical centers of the United States, and I have learned many things. I am glad to state that I have found that the reality exceeds my own expectations through my readings.

Furthermore, as a final crown, I am attending the annual session of the American Medical Association, which constitutes the most outstanding event of medical progress for the enlightenment and benefit of all nations and to the great honor of American medicine. On my return home it will be my purpose to intensify our cultural relations and to study the ways and means by which this can be accomplished, as well as to avoid the problem that existed until the outbreak of the war, namely, that, economically speaking, Chile and other South American nations were further removed from the United States than from Europe, in spite of the geographic reality and the common interests of the Americas.

The Chilean Medical Association desires to maintain cordial relations with your great organization, and it is a pleasure for us to do homage to the American Medical Association and to extend our best wishes for permanent prosperity and success in fulfilling its high ideals of scientific advancements and unselfish services to the community.

I thank the House of Delegates for the invitation to attend its meetings and for the opportunity of expressing my friendship. Thank you.

ELECTION OF OFFICERS

The Speaker declared the next order of business to be the election of officers.

Election of President-Elect

Dr. Arthur T. McCormack, Kentucky, nominated for President-Elect Dr. Fred W. Rankin, Lexington, Ky., and the nomination was seconded by Dr. A. W. Adson, Minnesota; Dr. James E. Paullin, Section on Practice of Medicine; Dr. E. G. Wood, Tennessee; Dr. James Q. Graves, Louisiana; Dr. E. H. Cary, Texas; the delegates from the Washington State Medical Association; Dr. Louis A. Buie, Section on Gastro-Enterology and Proctology; Dr. J. Newton Hunsberger, Pennsylvania; Dr. J. N. Baker, Alabama; Dr. Felix J. Underwood, Mississippi; Dr. Walter G. Phippen, Massachusetts; Dr. Henry Cook Macatee, District of Columbia; Dr. William H. Myers, Georgia; Dr. Walter E. Vest, West Virginia; Dr. Edwin S. Hamilton, Illinois; Dr. F. S. Crockett, Indiana; Dr. Thomas F. Thornton, Iowa; Dr. Samuel J. Kopetzky, New York; Dr. William Weston, Section on Pediatrics, and Dr. A. A. Walker, Alabama, who moved that the nominations be closed. The motion was seconded by Dr. Clyde L. Cummer, Section on Dermatology and Syphilology, and carried unanimously. Dr. McCormack then moved that the Secretary cast the ballot of the House for Dr. Fred W. Rankin as President-Elect. The motion was seconded by Dr. H. B. Everett, Tennessee, and carried unanimously.

The Secretary cast the vote of the House for Dr. Fred W. Rankin, Lexington, Ky., for President-Elect of the American Medical Association, and the Speaker declared Dr. Rankin so elected.

Dr. William Weston, Section on Pediatrics, moved that the Speaker appoint a committee to notify Dr. Rankin of this action, and the motion was seconded by Dr. J. N. Baker, Alabama, and carried. The Speaker appointed Drs. Arthur T. McCormack, Kentucky; A. A. Walker, Alabama, and Edward R. Cunniffe, New York, to notify Dr. Rankin of the action taken and to conduct him to the House.

Election of Vice President

Dr. James E. Paullin, Section on Practice of Medicine, nominated for the office of Vice President a former member of the House, Dr. Charles A. Dukes, Oakland, Calif., and the nomination was seconded by Drs. Harvey B. Stone, Maryland; Robert A. Peers, California; Henry A. Luce, Michigan; Horace J. Brown, Nevada, and Thomas F. Thornton, Iowa. Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the nominations be closed. The motion was seconded by Dr. Clyde L. Cummer, Section on Dermatology and Syphilology, and carried.

On motion of Dr. W. E. Kittler, Illinois, seconded by Dr. E. H. Cary, Texas, and carried unanimously, the Secretary cast the vote of the House for Dr. Charles A. Dukes, Oakland, Calif., to serve as Vice President of the Association for the ensuing year, and the Speaker declared Dr. Dukes so elected.

The Speaker appointed as a committee to notify Dr. Dukes Dr. James E. Paullin, Section on Practice of Medicine, and Dr. Robert A. Peers, California.

Election of Secretary

Dr. William R. Brooksher, Arkansas, nominated Dr. Olin West, Chicago, to succeed himself as Secretary of the American Medical Association, and the nomination was seconded by Drs. Walter E. Vest, West Virginia; Joseph F. Smith, Wisconsin; William Weston, Section on Pediatrics; Andrew F. McBride, New Jersey; Felix J. Underwood, Mississippi; Robert E. Schlueter, Missouri, and H. B. Everett, Tennessee.

Dr. John H. O'Shea, Washington, moved that the nominations be closed. The motion was seconded by Dr. E. G. Wood, Tennessee, and carried.

Dr. O'Shea then moved that the Vice Speaker cast the ballot of the House for Dr. Olin West as Secretary of the American Medical Association for the ensuing year, and the motion was seconded by Dr. H. A. Luce, Michigan, and carried unanimously.

The Vice Speaker cast the vote of the House for Dr. Olin West, Chicago, as Secretary of the American Medical Association for the ensuing year, and the Speaker declared Dr. West elected to the office.

Election of Treasurer

Dr. Arthur W. Booth, Chairman, Board of Trustees, nominated Dr. Herman L. Kretschmer, Chicago, to succeed himself as Treasurer of the American Medical Association, and the nomination was seconded by Drs. Robert E. Schlueter, Missouri; Samuel J. Kopetzky, New York; John Z. Brown, Utah, and E. S. Hamilton, Illinois.

On motion of Dr. Samuel J. Kopetzky, New York, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, the nominations were closed.

Dr. Louis A. Buie, Section on Gastro-Enterology and Proctology, moved that the Secretary cast the ballot of the House for Dr. Herman L. Kretschmer as Treasurer of the American Medical Association for the ensuing year, and the motion was seconded by Dr. Olin H. Weaver, Georgia, and carried unanimously.

The Secretary cast the vote of the House for Dr. Herman L. Kretschmer, Chicago, as Treasurer of the Association for the ensuing year, and the Speaker declared Dr. Kretschmer so elected.

Address of President-Elect Fred W. Rankin

Dr. Arthur T. McCormack, Kentucky, on behalf of the committee, presented to the House of Delegates the President-Elect of the American Medical Association, Dr. Fred W. Rankin, Lexington, Ky., who addressed the House as follows:

Mr. Speaker, Members of the House of Delegates: For the honor you do me in choosing me as your President-Elect for the coming year I am grateful. That this honor does not come to me as an individual but as a representative of a section of the medical profession of the United States I am well aware. I accept this office in a spirit of humility, for as I pass in review the many eminent men who have preceded me in this capacity I am conscious of my unworthiness, and I am also impressed with the feeling of responsibility which this office carries. In these troublous times, the nation as a whole and the medical profession in particular face many and serious problems, and to whatever objectives the medical profession of the United States has dedicated itself I pledge you my sincere cooperation and wholehearted effort.

Gentlemen of the House of Delegates, I thank you again.

Election of Speaker of the House of Delegates

Dr. R. W. Fouts, Vice Speaker, took the Chair and stated that the next order of business was the election of a Speaker of the House of Delegates.

Dr. H. B. Everett, Tennessee, nominated Dr. Harrison H. Shoulders, Nashville, Tenn., to succeed himself as Speaker of the House of Delegates, and the nomination was seconded by Drs. Arthur T. McCormack, Kentucky, and William Weston, Section on Pediatrics, after which it was moved by Dr. E. S. Hamilton, Illinois, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried, that the nominations be closed.

Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the Secretary be empowered to cast the vote of the House for Dr. Harrison H. Shoulders, Nashville, Tenn., as Speaker of the House of Delegates, and the motion was seconded by Dr. James Q. Graves, Louisiana, and carried unanimously.

The Secretary cast the vote of the House for Dr. Harrison H. Shoulders as Speaker of the House of Delegates for the ensuing year, and the Vice Speaker declared him so elected.

Election of Vice Speaker of the House of Delegates

The Speaker resumed the Chair and declared the next order of business to be the election of a Vice Speaker of the House of Delegates.

Dr. E. S. Hamilton, Illinois, nominated Dr. R. W. Fouts, Omaha, to succeed himself as Vice Speaker of the House of Delegates, and the nomination was seconded by Drs. William H. Myers, Georgia; Thomas F. Thornton, Iowa; H. B. Everett, Tennessee; Homer L. Kerr, Missouri; J. Newton Hunsberger, Pennsylvania, and Frank E. Reeder, Michigan.

Dr. Olin H. Weaver, Georgia, moved that the nominations be closed, and the motion was seconded by Dr. Arthur T. McCormack, Kentucky, and carried unanimously.

On motion of Dr. Arthur T. McCormack, Kentucky, seconded by Dr. W. E. Kittler, Illinois, and carried unanimously, the Secretary cast the vote of the House for Dr. R. W. Fouts, Omaha, to succeed himself as Vice Speaker of the House of Delegates for the ensuing year, and the Speaker declared Dr. Fouts so elected.

Election of Trustees

ADDRESS OF DR. THOMAS S. CULLEN

The Speaker declared the next order of business to be the election of Trustees and requested the privilege of the House to present Dr. Thomas S. Cullen, retiring Trustee who addressed the House as follows:

For years it was my privilege to sit in this House of Delegates, first as a representative of the Section on Obstetrics and Gynecology and later as one of the representatives of our good old state of Maryland.

Twelve years ago I was elected a member of the Board of Trustees, and it has been my good fortune to sit on this Board ever since.

I need say nothing about the House of Delegates, but I have ever been impressed by the sincerity and fairness of its members and by the vast amount they have accomplished in the short time they have been in session each year. The great value of their deliberations has been amply shown by the tremendous advance of the American Medical Association.

As the Trustees are the appointees of the House of Delegates, it is only right and proper that about once in twenty-five years the Trustees should give a short personal, general accounting of their activities in addition to their annual report. As the senior and retiring member, I shall now do so in a few words.

The nine members of the Board of Trustees who have the pleasure of being your representatives between annual sessions come from all parts of the United States. The farthest west has been Portland, Ore.; the farthest east, Boston, Massachusetts.

At nearly every meeting all nine members have been present. The only excuses I have ever heard for their being absent have been either illness or death. The members fully realize that they are your representatives and that they must do their utmost to carry out your wishes. Never in the twelve years have I seen any action taken that did not look to the best interests of American medicine.

In financial matters, Dr. Herman Kretschmer, our Treasurer, and the Finance Committee of the Board, have ever been more solicitous about the Association's funds than they have been about their own. The present financial condition speaks eloquently of this fact.

Day after day for weeks I attended the recent trial in Washington, and after each visit I felt prouder and prouder of the American Medical Association and of the Medical Society of the District of Columbia. I do not see how they could have handled a very difficult situation with more wisdom, with more patience, with more forbearance and with more tact.

The publishing of the entire trial in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION was a master stroke of statesmanship. The citizens of this country will gradually learn that the American Medical Association, through its various councils, spends hundreds of thousands each year to improve medical teaching, to improve hospital facilities and to protect the citizens of America. In due time the people of this country will begin to realize that the medical profession is in reality their truest friend.

We have in Dr. Olin West one of the best secretaries and general managers that this or any other country has ever seen. How he has accomplished so much is a marvel to the Trustees.

Dr. Morris Fishbein edits the most up to date and far reaching medical journal to be found anywhere in the world.

The Trustees are more than proud of the fine work done by the personnel of headquarters.

Presidents and Trustees of the Association come and go, but the General Manager and the Editor are endowed with perennial youth and continue to carry out the policies of this House of Delegates in a masterly fashion.

The people of the United States have little idea of the vast amount the American Medical Association is at the present moment doing to help the government place this country on a safe and sure foundation.

In years past we have been accustomed to go to the medical centers of Europe for postgraduate work. After this dreadful war is over, it will require many decades before Europe will recover. In the meantime, America must be the mecca for those desiring postgraduate medical training.

We have the men and facilities to undertake this vital work. We may well be thankful and proud that American medicine is so firmly grounded and that her men have in the past added so much to the betterment of mankind. They will do ever more in the future.

Dr. A. R. McComas, Missouri, moved that this address of Dr. Cullen be transmitted to the Secretary and to Dr. Fishbein and through him to the press, and the motion was seconded by Dr. Harry H. Wilson, California, and carried.

ELECTION OF TRUSTEE TO SUCCEED DR. AUSTIN A. HAYDEN, DECEASED

The Speaker declared nominations in order for the election of a Trustee to succeed Dr. Austin A. Hayden, deceased, for a term ending in 1943.

Dr. G. Henry Mundt, Illinois, nominated for Trustee Dr. Ernest E. Irons, Chicago, to fill the unexpired term of Dr. Austin A. Hayden, deceased, ending in 1943, and the nomination was seconded by Drs. John Z. Brown, Utah; James E. Paullin, Section on Practice of Medicine; M. de la Pila, Puerto Rico; George P. Johnston, Wyoming, and Walter E. Vest, West Virginia.

Dr. Edward M. Pallette Sr., California, moved that the nominations be closed, and the motion was seconded by Dr. Thomas F. Thornton, Iowa, and carried.

On motion of Dr. G. Henry Mundt, Illinois, seconded by Dr. John Z. Brown, Utah, and carried unanimously, the Secretary cast the vote of the House for Dr. Ernest E. Irons, Chicago, as a member of the Board of Trustees to fill out the unexpired term of Dr. Austin A. Hayden, deceased, ending in 1943, and the Speaker declared him so elected.

ELECTION OF TRUSTEE TO SUCCEED DR. THOMAS S. CULLEN

Dr. William H. Myers, Georgia, placed in nomination Dr. Charles W. Roberts, Atlanta, Ga., to succeed Dr. Thomas S. Cullen, Baltimore, whose term expires this year and who, according to the By-Laws, is not eligible for reelection, and the nomination was seconded by Drs. William R. Brooksher, Arkansas; H. B. Everett, Tennessee; W. A. Coventry, Minnesota; Louis A. Buie, Section on Gastro-Enterology and Proctology; Holman Taylor, Texas; Felix J. Underwood, Mississippi; J. Newton Hunsberger, Pennsylvania; James Q. Graves, Louisiana, and Walter B. Martin, Virginia.

On motion of Dr. James E. Paullin, Section on Practice of Medicine, seconded by Dr. J. Newton Hunsberger, Pennsylvania, and carried, the nominations were closed.

Dr. Paullin then moved that the Secretary cast the vote of the House of Delegates for Dr. Charles W. Roberts as Trustee of the Association, and the motion was seconded by Dr. Andrew F. McBride, New Jersey, and carried unanimously.

The Secretary cast the vote of the House of Delegates for Dr. Charles W. Roberts, Atlanta, Ga., as a member of the Board of Trustees for a term of five years, ending in 1946, and the Speaker declared Dr. Roberts so elected.

Nominations for Standing Committees

Dr. Frank H. Lahey, President, submitted the following nominations for standing committees, which, on motions duly made, seconded and carried, were confirmed by the House:

Dr. Walter F. Donaldson, Pittsburgh, to succeed himself on the Judicial Council for a term ending in 1946.

Dr. Frederick A. Collier, Ann Arbor, Mich., to succeed Dr. S. P. Mengel, Wilkes-Barre, Pa., on the Council on Scientific Assembly, for a term ending in 1946.

Dr. Arthur W. Booth, Chairman of the Board of Trustees, placed in nomination for membership on the Council on Medical Education and Hospitals to succeed Dr. Fred Moore, deceased, for a term ending in 1948, the following: Dr. Russell L. Haden, Cleveland; Dr. J. Milton Robb, Detroit, and Dr. Harvey B. Stone, Baltimore.

On request of the Speaker, the tellers spread the ballot, and the Secretary announced that 171 delegates had been registered, 160 delegates had been reported present and 142 votes had been cast, of which Dr. Haden received 45, Dr. Robb 32 and Dr. Stone 65.

The Speaker ruled that, since no nominee had received the majority of the votes cast, the name of the nominee receiving the smallest number of votes, namely, Dr. J. Milton Robb, would be dropped and a vote taken on the two remaining nominees.

The tellers again spread the ballot, and the Secretary announced that 160 delegates had been reported present and 139 votes been cast, of which Dr. Haden received 57 and Dr. Stone 82.

The Speaker declared that the House of Delegates had elected Dr. Harvey B. Stone, Baltimore, as a member of the Council on Medical Education and Hospitals, for a term of seven years, ending in 1948.

Dr. Fred W. Rankin, newly elected President-Elect, tendered his resignation as a member of the Council on Medical Education and Hospitals, and Dr. Arthur W. Booth, Chairman of the Board of Trustees, presented the following nominations for membership on that Council to take the place of Dr. Rankin, resigned, for a term ending in 1943: Dr. D. C. Elkin, Atlanta, Ga.; Dr. Russell L. Haden, Cleveland, and Dr. J. Milton Robb, Detroit.

The tellers spread the ballot, and the Secretary announced that 160 delegates had been recorded present and that 138 votes had been cast of which Dr. Elkin received 13, Dr. Haden 107 and Dr. Robb 18.

The Speaker declared that Dr. Russell L. Haden, Cleveland, had been elected a member of the Council on Medical Education and Hospitals to fill the unexpired term of Dr. Fred W. Rankin, resigned, ending in 1943.

Election of Affiliate and Associate Fellows

The Secretary presented the following nominations for Affiliate and Associate Fellowship, which, on motions duly seconded and carried, were confirmed by the House:

NOMINATIONS FOR AFFILIATE FELLOWSHIP APPROVED BY THE COUNCIL ON SCIENTIFIC ASSEMBLY

Aultz, L. L., Omar, W. Va.	Jelliffe, Smith Ely, New York.
Bates, W. A., Aberdeen, S. D.	Jobse, William, Milwaukee.
Beil, John W., Kansas City, Mo.	Kalayjian, D. S., Parker, S. D.
Bell, George H., New York.	Knowlton, Charles D., Rockport,
Berling, A. E., Wilmette, Ill.	Mass.
Brown, Samuel Skinner, New York.	Leonhardt, Heinrich, North Tona-
Brown, W. L., El Paso, Texas.	wanda, N. Y.
Burdick, Gordon G., Chicago.	Looze, J. J., Wisconsin Rapids,
Burkhardt, Edward A., Kansas	Wis.
City, Mo.	Malcolm, P. E. D., New York.
Caton, William P., Alexandria, Va.	McEwen, Mary G., Evanston, Ill.
Chetwood, Charles H., New York.	Mobley, J. C., Elizabethtown, Ky.
Clifford, Joseph W., Worthington,	Nichols, Charles B., Auxvasse, Mo.
Ind.	Norwood, M. L., Lockesburg, Ark.
Cohen, Martin, New York.	Onstott, Elmer, Saltsburg, Pa.
Cox, Allen E., Helena, Mont.	Parker, Truman A., La Jolla, Calif.
Cranston, William J., Rockport,	Parrish, John W., Brooklyn.
N. Y.	Pedersen, James, New York.
Curry, Stanton, Peekskill, N. Y.	Pedersen, Victor C., New York.
Dailey, W. G., Millersburg, Ky.	Pierpont, J. Harris, Pensacola, Fla.
De Forest, Henry P., New York.	Pittam, J. Thomas, Kansas City,
Dicus, George A., Streator, Ill.	Mo.
Drumme, N. D., Boston.	Reiche, Cecilia, Los Angeles.
Ellis, Edward F., Fayetteville, Ark.	Ruggles, E. Wood, Rochester, N. Y.
Fischer, Hermann, New York.	Russwurm, W. C., Helena, Mont.
Forbes, Henry H., New York.	Schoolfield, G. Clarence, Charles-
Frontz, H. C., Huntingdon, Pa.	ton, W. Va.
Funk, Z. E., Santa Rosa, N. M.	Schwab, Leslie W., Chicago.
Gilliam, James C., Des Arc, Ark.	Sheehy, John J., Garrison, N. Y.
Goetchiuss, H. DuBois, New York.	Skaggs, P. T., Miami, Fla.
Gray, Hugh B., Potter Place, N. H.	Staunton, Florence I., Peekskill,
Grim, Ezra C., Kirksville, Mo.	N. Y.
Hargrave, F. C., Pasadena, Calif.	Stewart, James L., Spearfish, S. D.
Hayd, H. E., Buffalo.	Stewart, William H., New York.
Hendon, G. A., Louisville, Ky.	Strang, W. W., New York.
Hitzel, Gustav A., Buffalo.	Tedford, R. H., Albany, N. Y.
Hoge, M. W., St. Louis.	Theobald, Carl, New York.
Hollister, W. L., Corpus Christi,	Virden, John E., New York.

NOMINATIONS OF AMERICAN MEDICAL MISSIONARIES FOR ASSOCIATE FELLOWSHIP APPROVED BY THE JUDICIAL COUNCIL

Adams, Evelyn A., Cameroun, West Africa.
Burchard, Mary A., Brindaban, United Province, India.
Foster, L. Paul, Musonia, East Africa.
Gieser, P. Kenneth, Chin Kiang, Kiangsu, China.
Hoffman, Rolla E., Meshed, Iran.
Seamans, Clifford M., French Concession, Tientsin, North China.

NOMINATIONS FOR ASSOCIATE FELLOWSHIPS APPROVED BY THE SECTIONS INDICATED

LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY

Krashen, Avery S., Chicago.

PHARMACOLOGY AND THERAPEUTICS

Abreu, Benedict E., Oklahoma City.
Anderson, Hamilton H., Peiping, China.
Grollman, Arthur, Baltimore.
Larson, Edward, Philadelphia.
Ligon, Edgar William Jr., Washington, D. C.
Mudd, Stuart, Haverford, Pa.
Pfeiffer, Carl, Detroit, Mich.
Smith, Austin E., Chicago.

PATHOLOGY AND PHYSIOLOGY

Huber, John Franklin, Philadelphia.

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Gebhard, Bruno, Cleveland.

RADIOLOGY

Cahal, Mac F., Chicago.

Place of 1944 Annual Session

Dr. Arthur W. Booth, Chairman, Board of Trustees, presented the following report:

Because of largely increased attendance at annual sessions of the Association, it is becoming increasingly difficult to select for a place of meeting any city which will provide altogether adequate and satisfactory facilities for scientific meetings and exhibits and at the same time provide adequate hotel accommodations.

Invitations for the 1944 session of the Association have been received from Atlantic City, New York, Philadelphia and St. Louis (the names are mentioned in alphabetical order).

Atlantic City has adequate hotel facilities and adequate accommodations for exhibits and meeting places in the same building.

New York has altogether adequate hotel facilities, but it does not have a satisfactory building for exhibits and for scientific meetings; all of the latter would have to be held in buildings other than the Auditorium.

Philadelphia has relatively limited hotel capacity, and the auditorium is rather remotely located.

St. Louis has an auditorium which is satisfactory for exhibit purposes but inadequate for section meetings. Several sections would have to be housed elsewhere.

Dr. Robert E. Schlueter, Missouri, presented an invitation from the St. Louis Medical Society and the people of St. Louis to meet in St. Louis in 1944. The nomination was seconded by Drs. James Q. Graves, Louisiana; Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and others.

Dr. Andrew F. McBride, New Jersey, withdrew the invitation for the Association to meet in Atlantic City in 1944 but extended it for 1945.

Dr. Charles Gordon Heyd, Past President, invited the Association to meet in New York City in 1944.

Dr. Walter F. Donaldson, Pennsylvania, invited the Association to meet in Philadelphia in 1944.

The Secretary announced that mayors, governors, members of civic bodies of all kinds and especially members of the medical schools in the various cities that have been nominated for the place of meeting in 1944 have supported the invitations received from the medical societies in the cities extending invitations.

On request of the Speaker, the tellers spread the ballot, and the Secretary announced that 160 delegates had been recorded present and that 134 votes had been cast, of which 17 votes had been cast for New York, 23 for Philadelphia, 93 for St. Louis and 1 for Atlantic City.

The Speaker declared that the House of Delegates had selected St. Louis in which to hold the 1944 annual session of the American Medical Association.

UNFINISHED BUSINESS

Resolutions from Section on Dermatology and Syphilology Dealing with Medical Preparedness

Dr. Clyde L. Cummer, Section on Dermatology and Syphilology, presented resolutions dealing with medical preparedness, which, as amended, read as follows:

The Section on Dermatology and Syphilology unanimously adopted resolutions, with the recommendation that they be laid before the Committee on Medical Preparedness of the American

Medical Association for appropriate action, the purpose of them being to insure the best medical care for the personnel of the Army and Navy, and also to insure the most effective use of civilian physicians, particularly specialists, who are or may be called to duty with the armed forces. These resolutions as amended by the House read:

Resolved, That separate services for the specialties recognized by the American Medical Association and by the national boards for the medical specialties should be organized and maintained in the Medical Corps of the Army and Navy; and

Resolved, That in all military and naval hospitals of sufficient size and permanence to warrant special departments, adequate physical facilities, equipment and personnel be made available for the proper practice of each specialty indicated; and

Resolved, That the national boards for the various specialties be asked to study the facilities to be made available in military and naval hospitals, with the view of giving credit to junior medical officers for the time spent in these departments.

The Section on Dermatology and Syphilology is further of the opinion that the adoption of these suggestions will be of significant influence in the following directions: 1. It will tend to integrate military and civilian medicine and to reduce the disruption caused by differing divisions of specialization in these two fields. 2. It will prove an effective means of attracting to military service young physicians who wish to qualify as specialists, as they will have opportunities for gaining experience which will be recognized by the American boards of special certification. 3. With particular regard to the specialty of dermatology and syphilology, it will tend to improve the methods of prevention and treatment of skin diseases and syphilis, not only in the large military and naval hospitals but throughout the services.

It is hoped that the resolutions passed by this section will have the support of the other sections of the American Medical Association and that prompt action will be taken on these resolutions by the House of Delegates and by the Committee on Medical Preparedness.

The resolutions as amended were referred to the Committee on Medical Preparedness with power to act with approval of the Board of Trustees after conference with the Surgeon Generals of the Army and Navy, on motion of Dr. Arthur T. McCormack, Kentucky, seconded by Dr. Cummer, and carried after discussion.

Expressions of Appreciation

Dr. Arthur T. McCormack, Kentucky, moved that the House of Delegates extend its deep appreciation to the Ohio State Medical Association, including the Academy of Medicine of Cleveland, to the president of the Ohio State Medical Association and the president of the Academy, to Governor Bricker and to Mayor Blythin, and especially to the Chairman of the Local Committee on Arrangements, Dr. Cummer, his associates and the ladies associated with them in the beautiful arrangements they have made, to the press and to the entire citizenship of Cleveland, because of receiving from every one a welcome that will always be remembered. The motion was seconded by Dr. J. Newton Hunsberger, Pennsylvania, and Dr. William Weston, Section on Pediatrics, after which Dr. Arthur J. Bedell, Section on Ophthalmology, moved that the House express that appreciation by a rising vote. The motion was carried unanimously by a rising vote.

The Vice Speaker took the chair, and Dr. Arthur T. McCormack, Kentucky, moved that the gratitude of the House be extended to the Speaker, and that affection, love and confidence be extended to the retiring President, Dr. Nathan B. Van Etten, with the hope that his future contributions to medicine and to human life, his welfare and his happiness will continue for many, many years. The motion was seconded and carried by a rising vote.

The Speaker resumed the chair and stated that a motion to adjourn was in order.

On motion of Dr. William H. Myers, Georgia, duly seconded and carried, the House adjourned sine die at 4:20 p. m.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit at the Cleveland session was notable for its attractiveness and for the excellent demonstrations by all who participated. New booth equipment was used throughout, including fluorescent lighting.

There were one hundred and seventy-one exhibits, one hundred and fifty-nine of which were presented under the auspices of the various sections and ten on national defense and war medicine. There were two special exhibits subsidized by the Board of Trustees and one hundred and five motion pictures, which were shown in six areas adjoining the exhibits.

The Special Exhibit on Fractures was presented for the eleventh time under the auspices of a committee composed of Dr. Kellogg Speed, Chicago, chairman; Dr. Frank D. Dickson, Kansas City, Mo., and Dr. Walter Estell Lee, Philadelphia. Dr. Carl H. Lenhart, Cleveland, served as local representative. Nearly fifty physicians assisted with the demonstrations in six booths continuously throughout the week, and a pamphlet describing the exhibit was distributed.

The Special Exhibit on Lane Backs was presented for the second time under the auspices of a committee composed of Dr. Frank R. Ober, Boston, chairman; Dr. Carl E. Badgley, Ann Arbor, Mich.; Dr. J. Archer O'Reilly, St. Louis; Dr. Arthur Steindler, Iowa City, and Dr. Philip D. Wilson, New York, with the collaboration of Dr. Eben J. Carey, Milwaukee; Dr. Albert Ferguson, Brookline, Mass.; Dr. Theodore Willis, Cleveland, and Dr. Walter J. Zeiter, Cleveland. A group of fifty physicians participated throughout the week in the demonstrations, and a pamphlet describing the exhibit was distributed.

The group of exhibits on national defense and war medicine emphasized some of the factors paramount in the present emergency. Three large exhibits on the desiccation of human blood plasma received special certificates of merit. Another exhibit on aviation medicine received a bronze medal. There were six motion pictures dealing with the various phases of national defense and war medicine shown in an area adjoining the exhibits.

The Section on Practice of Medicine presented twenty-six exhibits, including a large group on heart disease and several historical exhibits. Four exhibits received certificates of merit and four received honorable mention. Dr. Louis B. LaPlace, Philadelphia, was the section representative.

The Section on Surgery, General and Abdominal, presented twenty-six exhibits, including a group on the subject of burns and a group on cancer. To this section were awarded a gold medal, a silver medal, a bronze medal, a certificate of merit and an honorable mention. Among the motion pictures dealing with surgery were seventeen on general surgery, fourteen on the surgical aspects of cancer, nine on plastic surgery and eleven on surgical anatomy. The section representative was Dr. Grover C. Penberthy, Detroit.

The Section on Obstetrics and Gynecology presented eleven exhibits, one of which received a certificate of merit. There were five motion pictures. The section representative was Dr. H. Close Hesselstine, Chicago.

The Section on Ophthalmology had seven exhibits, one of which received a certificate of merit and one an honorable mention. There were one motion picture and one lantern slide demonstration on the subject of ophthalmology. The committee from the section consisted of Dr. Georgiana Dyorak Theobald, Oak Park, Ill., chairman; Dr. Derrick Vail, Cincinnati, and Dr. John E. L. Keyes, Youngstown, Ohio.

The Section on Laryngology, Otology and Rhinology presented five exhibits, two of which received honorable mention. There were two motion pictures. The section representative was Dr. Fred W. Dixon, Cleveland.

The Section on Pediatrics had eight exhibits, among which were three on the control of air borne infection which received special mention. The section representative was Dr. Arthur F. Abt, Chicago.

The Section on Pharmacology and Therapeutics presented six exhibits, two of which received honorable mention. The section representative was Dr. O. P. J. Falk, St. Louis.

The Section on Pathology and Physiology had fourteen exhibits. The section representative was Dr. Frank W. Konzelmann, Philadelphia.

The Section on Nervous and Mental Diseases showed six exhibits and six motion pictures. The section representative was Dr. Frederick P. Moersch, Rochester, Minn.

The Section on Dermatology and Syphilology showed seven exhibits, one of which received a silver medal and three of which received certificates of merit. There were six motion pictures and a lantern slide demonstration. The representative was Dr. Hamilton Montgomery, Rochester, Minn.

The Section on Preventive and Industrial Medicine and Public Health presented twelve exhibits, two of which received certificates of merit. Three motion pictures were shown. The representative to the section was Dr. Paul A. Davis, Akron, Ohio.

The Section on Urology presented six exhibits, one of which received a certificate of merit and one honorable mention. There were twelve motion pictures. The section representative was Dr. John H. Morrissey, New York.

The Section on Orthopedic Surgery had six exhibits, one of which received a certificate of merit. There were three motion pictures. The section representative was Dr. Theodore A. Willis, Cleveland.

The Section on Gastro-Enterology and Proctology had six exhibits, one of which received a gold medal. There were two motion pictures. Dr. Sara M. Jordan, Boston, was the section representative.

The Section on Radiology presented five exhibits, one of which received a certificate of merit. The section representative was Dr. S. W. Donaldson, Ann Arbor, Mich.

The Section on Anesthesiology presented eight exhibits, one of which received honorable mention. There was one motion picture. The section representative was Dr. Paul M. Wood, New York.

Thirty-four papers read before the sections of the Scientific Assembly were correlated with the exhibits in the Scientific Exhibit.

Appreciation is expressed to Western Reserve University Medical School for the students who assisted in the demonstrations on fractures and lame backs and in the motion picture theaters.

Acknowledgment is likewise made to the many Cleveland physicians for their numerous courtesies and to the local committee on Scientific Exhibit, of which Dr. Robert M. Stecher was chairman.

REPORT OF THE COMMITTEE ON AWARDS

The Committee on Awards made the following report:

GROUP I

(Awards in Group I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.)

The GOLD MEDAL to Alvin L. Berman, F. S. Grodins and A. C. Ivy, Northwestern University Medical School, Chicago, for exhibit on the rationale of bile salt therapy.

The SILVER MEDAL to Harold Thomas Hyman, William Leifer and Louis Chargin, Mount Sinai Hospital, New York, for exhibit illustrating massive dose chemotherapy of early syphilis by the intravenous drip method.

The BRONZE MEDAL to Walter M. Boothby, W. R. Lovelace, C. W. Mayo and A. H. Bulbulian, Mayo Foundation, Rochester, Minn., for exhibit illustrating physiologic problems in aviation medicine.

CERTIFICATES OF MERIT, Group I, are awarded to the following (alphabetically arranged):

Charles C. Higgins, Cleveland Clinic, Cleveland, for exhibit illustrating renal lithiasis, an experimental and clinical study.

Walter A. Hoyt, Adrian E. Davis and George Van Buren, Akron Children's Hospital, Akron, Ohio, for exhibit on the treatment of acute osteomyelitis by sulfathiazole without operation.

Charles Huggins, George Gomori, C. V. Hodges and W. W. Scott, University of Chicago, Chicago, for exhibit illustrating phosphatases and carcinoma of the prostate gland.

Benjamin S. Kline, Mount Sinai Hospital, Cleveland, for exhibit illustrating new standard antigen (water purified) for the microscopic slide precipitation tests for syphilis.

Phillips Thygeson and W. L. Stone Jr., Institute of Ophthalmology, New York, for exhibit on the epidemiology of inclusion conjunctivitis.

Leandro M. Tocantins, J. F. O'Neill and H. W. Jones, Jefferson Medical College of Philadelphia, Philadelphia, for exhibit on infusions of blood and other fluids into the circulation via the bone marrow.

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged):

That of F. Lowell Dunn, University of Nebraska College of Medicine, Omaha, and Walter J. Rahm Jr., New York, on the cathode ray visualization of normal and pathologic chest sounds.

That of Chevalier L. Jackson and John Franklin Huber, Temple University School of Medicine, Philadelphia, on applied anatomy of the tracheobronchial tree.

That of Louis N. Katz, Raymond S. Megibow, Franz S. Steinitz, Milton Mendlowitz and Maurice Sokolow, Michael

Reese Hospital, Chicago, illustrating observations on pulmonary embolism.

That of H. G. Kobrak, J. R. Lindsay and H. B. Perlman, University of Chicago, Chicago, on the conduction of sound in the ear.

That of E. Perry McCullagh, E. J. Ryan and D. Roy McCullagh, Cleveland Clinic, Cleveland, on male sex hormones—some physiologic and clinical observations.

That of Thomas H. Seldon and John S. Lundy, Institute of Experimental Medicine, Mayo Foundation and Section on Anesthesia, Mayo Clinic, Rochester, Minn., on effect of certain general anesthetic agents on the small vessels of the rabbit's ear.

GROUP II

(Awards in Group II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation and correlation of facts.)

The GOLD MEDAL to Waltman Walters, Howard K. Gray and James T. Priestley, Mayo Clinic, Rochester, Minn., for exhibit illustrating malignant lesions of the stomach; importance of early treatment and results.

The SILVER MEDAL to Grover C. Penberthy and Charles N. Weller, Children's Hospital of Michigan, Wayne University College of Medicine, Detroit, for exhibit illustrating the treatment of burns.

The BRONZE MEDAL to G. V. Brindley, Scott and White Hospital, Temple, Texas, for exhibit illustrating carcinoma of the colon; factors affecting its cure.

CERTIFICATES OF MERIT, Group II, are awarded to the following (alphabetically arranged):

David C. Elliott, Chicago; George Baehr, New York; Loren Shaffer, Detroit; Glenn S. Usher and S. Allan Lough, Washington, D. C., U. S. Public Health Service, for exhibit on syphilis—massive dose therapy.

Henry N. Harkins, Henry Ford Hospital, Detroit, exhibit illustrating the treatment of burn shock.

Robert A. Kehoe, University of Cincinnati College of Medicine, Cincinnati, for exhibit on lead poisoning.

John T. Murphy and C. E. Hufford, Toledo, Ohio, for exhibit on bone tumors.

I. C. Rubin, Mount Sinai Hospital, New York, for exhibit illustrating diagnosis of impaired tubal function by kymographic uterotubal insufflation and soluble viscous contrast medium.

E. R. Sayers and H. H. Schrenk, United States Bureau of Mines, Washington, D. C., for exhibit on respiratory protective equipment in mining and industrial work.

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged):

That of K. K. Chen and G. H. A. Clowes, the Lilly Research Laboratories, Indianapolis, on variations of drug action.

That of Alfred E. Cohn, Hospital of the Rockefeller Institute for Medical Research, New York, on some aspects of the natural history of rheumatic heart disease.

That of Robert M. Daley, Richard Gubner and Harry E. Ungerleider, Equitable Life Assurance Society, New York, on the clinical evaluation of heart size measurements.

That of W. D. Gatch and J. S. Battersby, Indiana University Medical Center, Indianapolis, on effect of bowel distention on plasma volume.

That of W. Ray Jones, King County Hospital System, Seattle, on microslide diagnosis of atypical gonorrhea.

That of Albert D. Ruedemann, Cleveland Clinic, Cleveland, on exophthalmos.

SPECIAL CERTIFICATES OF MERIT

Special Certificates of Merit are awarded to the following historical exhibits (alphabetically arranged):

Paul E. Bechet, New York Post-Graduate Medical School and Hospital, New York, for exhibit on early American dermatologists.

Howard Dittrick, Cleveland Medical Library, Cleveland, for exhibit showing objects relating to blood letting, cupping transfusion, blood pressure and blood examination.

Russell L. Haden and Joseph Lucas, Cleveland Clinic, Cleveland, for exhibit on origin and early history of the microscope.

Nolie Mumey, Denver, for exhibit on primitive medicine.

Special Certificates of Merit are awarded to the following for the development of a method for the desiccation of human blood plasma (alphabetically arranged):

Samuel B. Harper and A. E. Osterberg, Mayo Clinic, Rochester, Minn.

Frank W. Hartman, Henry Ford Hospital, Detroit.

Joseph M. Hill, E. E. Muirhead, C. E. Ashworth and Louis Waters, Baylor University Hospital, Dallas, Texas.

SPECIAL COMMENDATION

Special commendation is given to the exhibits on the control of air borne infection.

SUBSIDIZED EXHIBITS

The Committee on Awards commends highly the special exhibits on fractures and lame backs sponsored by the Ameri-

can Medical Association, and the exhibit on nutritionally improved flour presented by members of the Council on Foods and Nutrition of the American Medical Association.

COMMENTS AND RECOMMENDATIONS

The innovation of providing six small theaters for the projection of silent and sound motion pictures introduces a feature of the Scientific Exhibit which will undoubtedly grow in interest and in importance. The transfer of motion pictures from the exhibit booths to the theaters has many obvious advantages. It is now quite apparent that motion pictures, particularly those in natural color, provide a teaching medium of increasing importance. It is the recommendation of the Committee on Awards that adequate space and facilities be provided at the forthcoming Atlantic City meeting for continuation and possible extension of this new feature of the Scientific Exhibit.

The Committee commends highly the plan of coordinating, as far as possible, the exhibits with papers read by exhibitors before the section meetings. The representatives to the Scientific Exhibit from the sixteen sections have rendered yeoman service to the Committee on Scientific Exhibit and to the Director of the Scientific Exhibit in encouraging the presentation of exhibit material of exceptional merit. Because of the general excellence of the exhibits, only the limitation of the number of awards available prevented official recognition of many exhibits of undoubted merit.

The Committee on Awards recommends to the Board of Trustees that certain of the exhibits which are of a character which would permit their utilization as traveling exhibits for loan to state or sectional medical societies be acquired for that purpose.

The Committee is deeply impressed with the spirit of cooperation existing between the Committee on Scientific Exhibit of the Board of Trustees, the Advisory Committee to the Scientific Exhibit, the section representatives and the Director of the Scientific Exhibit. This report would fail in its mission if it did not give particular recognition to the ability and tactfulness of Dr. Thomas G. Hull, Director of the Scientific Exhibit, in making the Scientific Exhibit the outstanding feature of the annual session of the American Medical Association.

WALTER M. SIMPSON, Dayton, Ohio, Chairman.

HAROLD S. DIEHL, Minneapolis.

HARRY S. GRADLE, Chicago.

WILLIAM P. HERBST, Washington, D. C.

MAX M. PEET, Ann Arbor, Mich.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status.—H. R. 3864 has been reported to the House, proposing to amend an act to provide for the registry of pursers and surgeons as staff officers on vessels of the United States. Under existing law, senior registered surgeons and other surgeons, if any, and their assistants or aides are placed under the charge of the senior registered purser. The pending bill proposes to set up a separate medical division of the staff department, to be under the charge of the senior registered surgeon of the vessel, who will be responsible solely to the master of the vessel. S. 1524 has passed the Senate, authorizing the President to provide for the deferment from training and service under the Selective Training and Service Act of men who are 28 years old or over. H. R. 4545 has passed the House and Senate, providing for the acquisition and equipment of public works made necessary by the defense program, including the acquisition and equipment of hospitals.

Bills Introduced.—H. R. 5045, introduced by Representative Mott, Oregon, proposes to authorize pensions to all persons who served ninety days in foreign service under the jurisdiction of the Quartermaster General, Surgeon General of the United States Army, the Secretary of the Navy, or Marine Corps, during the Spanish-American War, including the Philippine Insurrection and the Chinese Boxer Rebellion. H. R. 4882, introduced by Representative Healey, Massachusetts, proposes,

among other things, to extend the coverage of the Social Security Act with respect to old age and survivors' insurance benefits to employees of corporations, community chests, funds or foundations organized and operated exclusively for charitable, religious, scientific, literary or educational purposes, for the prevention of cruelty to children or animals and for religious purposes, excluding duly ordained or commissioned or licensed ministers of any church in the regular exercise of their ministry and excluding services performed by regular members of religious orders in the exercise of duties required by such orders.

STATE MEDICAL LEGISLATION

Texas

Bill Enacted.—H. 620 was approved by the governor, June 10, authorizing the board of regents of the University of Texas to maintain a hospital and to collect a compulsory group hospitalization fee of not to exceed \$4 for any one semester or for any one summer session from each student as a prerequisite to registration in the university.

Pennsylvania

Bill Introduced.—S. 1172 proposes to appropriate \$100,000 to the department of health to equip and operate a sanatorium in Butler County for the treatment of cancer and for cancer research.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

ARKANSAS

Annual Registration Due July 1.—All licentiates of the State Medical Board of the Arkansas Medical Society are required by law to register this year with the board on or before July 1 and at that time to pay the required fee, which is \$2 for residents and \$4 for nonresidents. After this year the required date for registration will be January 1 and the fee required will be such fee as may be set by the board not less than sixty days in advance of January 1. If a licentiate fails to pay the required annual fee before March 1 of any year, his license to practice automatically expires but may be reinstated on the payment of all delinquent fees and a penalty of \$1 for each year, or part thereof, of delinquency.

IDAHO

Annual Registration Due July 1.—All practitioners of medicine and surgery holding licenses to practice in Idaho are required by law to register annually on July 1 with the Department of Law Enforcement and at that time to pay a fee of \$2. If a licentiate has not paid the annual registration fee by October 1, his license can be canceled but will be restored within five years thereafter on payment of the delinquent fees and a \$10 penalty. If a license has been canceled for more than five years, it can be reinstated only on the payment of \$25 and on the licentiate's passing an examination, the nature of which shall be determined by the Department of Law Enforcement.

ILLINOIS

Personal.—Dr. Roger W. DeBusk, assistant director of St. Luke's Hospital, New York, has been appointed superintendent of Evanston Hospital, succeeding Miss Ada Belle McCleery, who retired May 1 after holding the position since 1921.—Dr. Cecil A. Z. Sharp has resigned as superintendent of the Macomb health district to enter private practice in Trenton.

Fifty Years of Medicine.—Dr. William O. Tuck, Plymouth, recently completed fifty years in the practice of medicine.—Dr. Thomas J. Hilliard, Fairfield, observed his fiftieth anniversary as a physician on April 20. He has been practicing in Fairfield since 1906.—Dr. and Mrs. Edward A. Elfeld, Arlington Heights, were guests of honor at a dinner, recently, marking the physician's completion of fifty years in the practice of medicine, thirty-nine of which were spent in Arlington Heights.

Chicago

Society News.—The Chicago Gynecological Society was addressed, April 18, by Drs. Edward A. Schumann, Philadelphia, on "An Evaluation of the Several Types of Cesarean Section and Their Indications" and Walter W. Coen, "Indications for the Schumann Type of Cesarean Section."—The Chicago Orthopedic Society was addressed, May 9, by Drs. John Albert Key, St. Louis, on "Use of Sulfanilamide and Sulfathiazole in Clean and Infected Operative Wounds" and Cly Howard Hatcher, "Solitary Eosinophilic Granuloma of Bone."—At the annual meeting of the Chicago Pathological Society on May 12 Drs. Karl A. Meyer and Alex B. Ragins discussed "Carcinoma of the Parathyroid."

Dr. Geiling Receives Mendel Medal.—Dr. Eugene M. K. Geiling, since 1936 professor and chairman of the department of pharmacology, University of Chicago, The School of Medicine, was presented with the Mendel Medal by Villanova College, Villanova, Pa., "for his contributions to the knowledge of the pituitary gland, its relation to other glands and for his assistance in the crystallization of insulin." The medal is "given annually for outstanding achievement in science." Dr. Geiling was born in Orange Free State, South Africa, in 1891 and graduated at Johns Hopkins University School of Medicine, Baltimore, in 1923. He has served on the faculties of the College of Agriculture, South Africa, 1917-1918; College of Medicine, University of Capetown, 1918-1919; Johns Hopkins, 1921-1935, and, in 1936, joined the University of Chicago. He is president of the American Society for Pharmacology and Experimental Therapeutics.

IOWA

State Medical Election—Coordinator Named for President.—Dr. Frank P. Winkler, Sibley, was chosen president-elect of the Iowa State Medical Society at its annual meeting in Davenport, May 16, and Dr. Earl B. Bush, Ames, was installed as president. Dr. Joseph B. Priestley, Des Moines, was named general coordinator to have charge of such functions as the new president will be unable to manage because of his army duties. Dr. Bush is a colonel in the National Guard on active duty with the army as chief surgeon at Camp Claiborne, La. Other officers elected include Drs. James C. Hill, Newton, and George C. Albright, Iowa City, vice presidents.

District Medical Meeting.—The Iowa and Illinois Central District Medical Association will hold its annual meeting at the Outing Club in Davenport, June 26. The speakers will include:

Dr. John A. Toomey, Cleveland, Pathogenesis of Poliomyelitis.
Dr. Howard K. Gray, Rochester, Minn., Cancer of the Stomach.
Dr. Otto H. Schwarz, St. Louis, Hyperplasia of the Endometrium.

At the banquet in the evening, medals will be presented to Drs. Edward F. Strohbehn, Davenport, and Thomas F. Beveridge, Muscatine, who have completed fifty years of practice. Dr. Morris Fishbein, Editor of THE JOURNAL, Chicago, will speak on "American Medicine Prepares."

KENTUCKY

Dr. Rankin Appointed to University Staff.—Dr. Fred W. Rankin, Lexington, President-Elect of the American Medical Association, has been appointed clinical professor of surgery at the University of Louisville School of Medicine, effective July 1.

LOUISIANA

Society News.—A joint meeting of the Orleans Parish Medical Society with the New Orleans Gynecological and Obstetrical Society, May 16, was designated the "Dr. Ernest S. Lewis Memorial Meeting." The speakers were Drs. Hiram W. Kostmayer, New Orleans, on "The Life of Dr. Maurice J. Gelpi" and Jacob P. Greenhill, Chicago, "The Practical Aspects of Gynecologic Endocrinology."

Personal.—Dr. Robert S. Teague Jr., instructor in pharmacology, Tulane University of Louisiana School of Medicine, New Orleans, recently was awarded the Lewis Cass Ledyard Jr. Fellowship for medical research, according to an announcement from the joint administrative board of the New York Hospital and Cornell University Medical College, New York. The award, providing \$4,000, is made annually to a young physician or surgeon demonstrating fitness to carry on original research of high order. Dr. Teague will engage in research on chemical substitutes for female sex hormones, newspapers reported. Dr. Teague graduated at the Department of Medicine, University of Chicago, in 1937.—Dr. William W. Leake, New Orleans, formerly superintendent of Charity Hospital, was appointed chief surgeon of the Illinois Central System, with offices in Chicago, effective May 1. He succeeds Dr. Guy G. Dowdall, Chicago, who retired on account of his health.

MASSACHUSETTS

State Medical Election.—Dr. George L. Schadt, Springfield, was chosen president-elect of the Massachusetts Medical Society at its annual meeting recently and Dr. Frank R. Ober, Boston, was inducted as president. Other officers are Drs. Edward P. Bagg, Holyoke, vice president; Michael A. Tighe, Lowell, secretary, and Charles S. Butler, Boston, treasurer.

Dr. Gordon Injured in England.—Dr. John E. Gordon, professor of preventive medicine and epidemiology, Harvard Medical School, Boston, who is now acting as liaison officer between the British Ministry of Health and the United States and director of the American Red Cross-Harvard University Hospital Unit in England, and the chief physician of the unit, Dr. Paul B. Beeson, resident physician of the Peter Bent Brigham Hospital and assistant in medicine, Harvard Medical School, Boston, were injured in a raid when Dr. Gordon's apartment was bombed. Dr. Gordon, writing to the British Ministry of Health, said: "Within a few minutes (after the explosion) one of your first aid workers, a young lady, popped in off the street, put a towel over my bleeding head, and with my colleague Dr. Beeson proceeded with us to the nearest first aid post. She deposited us with the nurse in charge there, said

a curt good night, and I have not seen her since. She just went about her business. At the first aid post we had the finest attention from four or five nurses and first aid workers. A young doctor arrived promptly and made a few minor repairs that were indicated. We were then put to bed at the first aid post between warm blankets, packed with hot water bottles and given a steaming cup of hot tea and a cigaret and within fifteen minutes were as comfortable as could be."

MICHIGAN

Hickey Memorial Lecture.—Dr. John T. Murphy, Toledo, Ohio, delivered the 1941 Hickey Memorial Lecture before the Wayne County Medical Society and the Detroit Roentgen Ray and Radium Society, Detroit, April 7. His subject was "The Use of X-Ray in the Treatment of Carcinoma of the Skin."

Annual Concert of Glee Club.—The seventh annual concert of the Glee Club of the Wayne County Medical Society was held at the Detroit Institute of Art, April 28. Marcus Kellerman, an honorary member of the society, is director of the Glee Club. Soloists were Drs. Starr L. Kline, tenor, and Leo P. Rennell, baritone, with piano selections by Drs. Reginald Stanley Brain and Henry S. Brown.

Nutrition Defense Committee.—Marie Dye, Ph.D., dean of the division of home economics and professor of foods and nutrition, Michigan State College, East Lansing, has been chosen chairman of the newly formed Michigan Nutrition Defense Committee. Membership in the committee, which held its first meeting April 30, has been drawn from twenty-two public agencies and private organizations, according to *Michigan Public Health*. Similar committees are being established in other states.

Personal.—Dr. Robert L. Novy, professor of clinical medicine, Wayne University College of Medicine, Detroit, has been made a member of the city board of health. He succeeds Dr. Clarence L. Candler, who has completed the unexpired term of the late Dr. William A. Evans.—John A. Galbo, D.D.S., Detroit, has been appointed a member of the Michigan State Council of Health.—Dr. Harry W. Plaggemeyer, Detroit, was recently made an honorary member of the Wisconsin Urological Society.—Dr. Plinn F. Morse, Detroit, was honored at a banquet, May 7, and presented with a gold watch from members of the staff of Harper Hospital. Dr. Eldwin R. Witwer was toastmaster, and speakers included Drs. George A. Kamperman and Lawrence Reynolds. All are from Detroit.

MONTANA

Society News.—Dr. Fred H. Albee, New York, was the principal speaker before the Montana Surgical Guild at its clinical meeting in Great Falls April 25.—Dr. E. Martin Larson, Great Falls, was reelected president of the Montana Tuberculosis Association at its meeting in Helena April 19; he has been president since 1934.—Dr. Marjorie K. Smith, St. Albans, N. Y., has been named assistant director of the maternal and child health division of the Montana State Board of Health.

NEBRASKA

Postgraduate Courses in Obstetrics and Pediatrics.—The University of Nebraska College of Medicine, Omaha, in cooperation with the maternal and child health committee of the Nebraska State Medical Association and the maternal and child health division of the Nebraska State Department of Health presented an extramural postgraduate course in obstetrics and pediatrics in five towns between June 9 and 20, two sessions in each town, one week apart. The instructors were Drs. Willis E. Brown, assistant professor of obstetrics and gynecology, and John L. Gedgoud, assistant professor of pediatrics at the university medical school. The towns visited were Grand Island, Hastings, Kearney, York and Beatrice. In addition, a statewide conference on care of premature infants is being presented with sessions at Norfolk, Alliance, North Platte, McCook, Grand Island, Hastings, Columbus and Beatrice, June 12 through 28. The lecturers are Dr. Albert V. Stoesser, associate professor of pediatrics, University of Minnesota Medical School, Minneapolis, and Miss Gertrude E. Carlsrud, R.N., of the division of child hygiene, Minnesota Department of Health, Minneapolis. This course is presented by the state medical association, the state health department, the Nebraska State Nurses Association and the Nebraska League of Nursing Education.

NEW YORK

Rochester Academy Awards.—The Rochester Academy of Medicine awarded its Albert D. Kaiser Medal "for distinguished service to the medical profession" to Dr. David B. Jewett at its annual meeting, May 6. Dr. Jewett was honored for his efforts in building up the academy's library. Scientific awards of \$100 and certificates were presented to Dr. Leonard K. Stalker for research on peptic ulcer and to Dr. William W. Stiles for research on leptospirosis.

Society News.—Dr. Robert S. Goodhart, Forest Hills, addressed the Tompkins County Medical Society, Ithaca, April 15, on "The Relations of Vitamins to Disease."—Dr. James M. Flynn, Rochester, then president of the Medical Society of the State of New York, addressed a joint meeting of the Warren, Washington and Saratoga county medical societies in Glens Falls, April 14, on "Organization in the Practice of Medicine."—Capt. Edwin N. Beery, M. R. C., U. S. Army, Governors Island, addressed the Utica Academy of Medicine and the Utica Dental Society at a joint meeting in Utica, April 17, on "The Medical Profession in a National Emergency."

New York City

Spring Festival.—The Medical Society of the County of Kings held its second spring festival, May 12-17. Tournaments in tennis and bowling were held during the week, there was a hobby show at the New Swedish Hospital and on Saturday May 17 the Doctors' Musical Society of Brooklyn gave its fifth annual concert at the Brooklyn Academy of Medicine.

Hospital News.—The cornerstone for a nine story addition to St. Vincent's Hospital was laid recently. The new building is part of a \$1,300,000 project which will bring the capacity of the hospital to 600. It will include also equipment, alterations and transfer of departments. Former Gov. Alfred E. Smith presided at the ceremony and Archbishop Francis J. Spellman laid the stone.—The cornerstone of a new building for Lebanon Hospital was laid April 20 by L. Victor Weil, president of the hospital. It is expected that the new structure, which will have a capacity of 400 beds, will be finished early next year.—A fellowship in ophthalmologic research has been established at Montefiore Hospital in memory of Ernestine Lambert Cohn. Dr. Virginia L. Lubkin, a member of the house staff, is the first holder of the fellowship.

Personal.—Dr. Ralph Irving Lloyd, Brooklyn, was the guest of honor at the annual dinner of the Brooklyn Ophthalmological Society, May 21. Dr. Lloyd, a past president of the Brooklyn society, is president-elect of the American Academy of Ophthalmology and Otolaryngology. Dr. Joseph E. Golding was toastmaster and speakers included Drs. Maurice L. Wieselthier, Maurice J. Dattelbaum, Percy Fridenberg and Algernon B. Reese. The society gave Dr. Lloyd a portable radio. About seventy-five eye physicians attended the dinner.—Dr. Charles Perley Gray was guest of honor at a dinner, May 19, given by the Seventh Regiment Veterans Association on the occasion of his retirement as colonel in the New York National Guard.—Dr. Edmund P. Fowler has been elected president of the New York League for the Hard of Hearing.

Typhoid Outbreak on Spanish Ship.—Three positive cases and three suspected cases of typhoid in New York, one at Ellis Island and two in Boston have been reported among passengers who debarked from the Spanish steamship *Magallanes* on May 24, the New York City Department of Health reported on June 3. The outbreak was discovered when Mount Sinai Hospital reported on May 28 that one passenger from the ship had arrived there with the disease. This patient later died. Investigation of the one hundred and sixty-one other passengers disclosed the other cases. The ship, which originally sailed from Bilbao, Spain, with three hundred and twenty-six passengers and a crew of one hundred and ninety-six, left New York on its return trip May 27, before the typhoid was discovered, and at the time of the report on June 2 nothing had been heard of it.

OKLAHOMA

Society News.—Dr. Albert R. Hatcher, Wellington, Kan., addressed the Garfield County Medical Society, Enid, April 24, on "Malignancies of the Breast."—Dr. Arthur Graham Asher, Kansas City, Mo., addressed the Tulsa County Medical Society, Tulsa, May 26, on "Chemical, Nutritional and Clinical Factors Influencing the Administration of Digitalis."—Drs. John H. Lamb, Oklahoma City, and Horton E. Hughes, Shawnee, addressed the Pottawatomie County Medical Society in Shawnee, May 17, on "Photography in Medicine."

PENNSYLVANIA

District Meetings.—The Eighth Councilor District of the Medical Society of the State of Pennsylvania held its annual meeting, June 19, on board the S. S. *South American*, sailing from Erie. The speakers included Lieut. Col. Edgar S. Everhart, medical officer in the National Guard on duty with the U. S. Army, state medical director of selective service, on "The Doctor and the Selective Service"; Dr. Daniel L. Borden, Washington, D. C., "The American Medical Association on Trial," and Francis F. Borzell, Philadelphia, president of the state medical society. The Woman's Auxiliary held its annual meeting at the same time.—The Third and Twelfth councilor districts held a joint meeting at Scranton, June 17. Speakers on the scientific program were Drs. Herbert B. Gibby, Wilkes-Barre, on "Use of Lyophilized Plasma in Peritonitis"; Harrison F. Flippin, Philadelphia, "Use and Abuse of Sulfonamides in General Practice," and Frank W. Konzelmann, Philadelphia, "The Laboratory Situation in Pennsylvania." After luncheon Drs. Francis F. Borzell, Philadelphia, president, and Lewis T. Buckman, Wilkes-Barre, president-elect of the state society, made addresses. The woman's auxiliaries of the two districts also held a joint meeting.

Philadelphia

New Officials of Woman's College.—Dr. Ellen C. Potter, director of medicine in the department of institutions and agencies of the state of New Jersey, has been made acting president of the Woman's Medical College of Pennsylvania to succeed Dr. Chevalier Jackson, who resigned after serving since 1935. At the same time Dr. Margaret D. Craighill, who has been acting dean since Sept. 15, 1940, was appointed dean. Dr. Potter graduated from the Woman's Medical College in 1903 and was a member of the faculty for many years in the department of gynecology. In 1920 she was appointed chief of the child health division of the state health department of Pennsylvania; in 1922, director of child welfare. From 1923 to 1927 she was state secretary of welfare, going to New Jersey in the latter year.

WASHINGTON

Annual Registration Due July 1.—All practitioners of medicine and surgery holding licenses to practice in Washington are required by law to register annually on or before July 1, with the director of licenses, and at that time to pay a fee of \$5, thereby renewing their licenses for one year. Failure on the part of a licensee timely to register and pay the required fee renders his license to practice invalid but his license may be reinstated on written application to the director and on payment of the delinquent fees and a penalty of \$10.

Society News.—Dr. Joseph Irving Tuell, Seattle, addressed the King County Medical Society, Seattle, May 9, on "Fractures of the Humerus Involving the Elbow Joint" and Drs. Kenneth K. Sherwood, Seattle, John W. Skinner, Kirkland, and Anette Bocker, A.B., on "Urinary Excretions of Thiamine in Clinical Cases."—Dr. James F. Blackman, Seattle, addressed the Pierce County Medical Society, Tacoma, May 13 on "Management of Crushing Injuries to the Thorax."—The Tacoma Surgical Club held its annual meeting May 3 with Dr. Harry E. Mock, Chicago, as the guest speaker. Traumatic surgery was the topic of the day.

WEST VIRGINIA

State Medical Election.—Dr. Richard O. Rogers, Bluefield, was named president-elect of the West Virginia State Medical Association at the annual meeting in Charleston, May 12-14. He will take office on Jan. 1, 1942. Vice presidents elected were Drs. Guy H. Michael, Belington, and Everett H. Starcher, Earlring. The president for this year is Dr. Robert King Buford, Charleston. The 1942 meeting will be held in White Sulphur Springs.

Changes in State Health Department.—Dr. Starling D. Steiner, Wellsburg, health officer of Brooke County, has been appointed director of county health work in the state health department to succeed Dr. Bruce H. Pollock, Charleston, who recently reported for duty with the U. S. Navy. Dr. Leon A. S. Saler, Charleston, U. S. Public Health Service, has been named acting director of the bureau of venereal diseases to replace Dr. Leon A. Dickerson, Fayetteville, who is in active service in the U. S. Army.

GENERAL

Meeting of Science Writers.—John J. O'Neill, science editor, New York *Herald Tribune*, was elected president of the National Association of Science Writers at a meeting held in conjunction with the meeting of the National Academy of Sciences in Washington, D. C., recently. Stephen J. McDonough, science writer of the Associated Press, Washington, was reelected treasurer and made secretary under a newly adopted constitution. Dr. Thomas Parran, surgeon general, U. S. Public Health Service, gave an "off the record" talk on his observations of living conditions, health and the morale of the British people during his recent visit to England.

National Defense and Home Economics.—The annual convention of the American Home Economics Association will be held in Chicago, June 22-26, at the Stevens Hotel. The program includes addresses by Helen S. Mitchell, Ph.D., of the Federal Security Agency, Washington, D. C., on "The National Nutrition Outlook"; Mary I. Barber, M.S., food consultant, Office of Production Management, Washington, "How the American Army Is Fed"; Harriet Elliott, M.A., head of the Consumer Division, Office of Price Administration and Civilian Supply, Washington, on "Protecting Civilian Supply"; Ruby Thompson of the Federal Security Agency, Athens, Ga., "Better Diets Through Increased Home Food Production," and Hazel K. Stiebeling, Ph.D., U. S. Bureau of Home Economics, Washington, "Do We Want Better Nutrition?"

Guggenheim Fellowships.—Among eighty-five fellowships granted by the John Simon Guggenheim Memorial Foundation for research to be carried on in 1941-1942 were the following of medical interest:

Cornelius Becker Philip, Ph.D., medical entomologist in the U. S. Public Health Service, Hamilton, Mont., will write a book on ticks and their relation to animal and human disease. He will work in Mexico, Colombia and Brazil.

Kenneth Stewart Cole, Ph.D., associate professor of physiology at Columbia University, New York, and consultant physicist, Presbyterian Hospital, will study the electrical aspects of the structure and function of living nerve.

Berry Campbell, Ph.D., assistant professor of anatomy, University of Oklahoma School of Medicine, Oklahoma City, will study integrative mechanisms of the spinal cord with particular reference to the basic locomotor behavior patterns. He will work at the Rockefeller Institute for Medical Research, New York.

Dr. Israel Lyon Chaikoff, associate professor of physiology, University of California, Berkeley, will investigate the use of radioactive phosphorus and iodine as indicators of metabolic processes.

Physical Therapy Meeting.—The ninth annual seminar of the Western Section of the American Congress of Physical Therapy will be held in Los Angeles on June 22. Sessions will be held in Taulson Hall, White Memorial Hospital. The following will participate:

Dr. Clarence W. Dail, Loma Linda, Calif., Physical Measures in the Treatment of Peripheral Vascular Diseases.

Dr. Joseph C. Risser, Pasadena, Differential Diagnosis and Treatment of Lumbosacral and Sacroiliac Pathology.

Dr. Harry C. L. Lindsay, Pasadena, Physical Medicine in Dermatology.

Dr. David H. Kling, Los Angeles, Place of Physical Therapy in the Treatment of Arthritis.

Dr. William H. Northway, San Francisco, Clinical Value of Ultraviolet Light Therapy.

Drs. Fred B. Moor, Los Angeles, and Genevieve L. Joy, Melrose, Mass., Artificial Fever in Brucellosis.

Dr. Frances Baker, San Francisco, Treatment of Fungous Infections by Iontophoresis.

Dr. John S. Hibben, Pasadena, Clinical Evaluation of Various Heart Energies.

Dr. Rodney F. Atsatt, Santa Barbara, Calif., General Physical Therapy Management of Poliomyelitis.

Dr. Mary Cornell McReynolds, Angwin, Calif., Degenerative Changes in Periarticular Tissues.

National Science Fund Election.—William J. Robbins, Ph.D., director of the New York Botanical Gardens, New York, was elected chairman of the board of directors of the National Science Fund at an organization meeting, May 21, in New York, and Winthrop W. Aldrich, chairman of the board of directors of the Chase National Bank, New York, was elected vice chairman. The directors include former President Herbert Hoover; Albert F. Blakeslee, Ph.D., Cold Spring Harbor, N. Y.; Luther P. Eisenhart, LL.D., Princeton, N. J.; Dr. Herbert S. Gasser, Mr. Walter S. Gifford, Carleton J. H. Hays, Ph.D., and Frank B. Jewett, Ph.D., New York; Dr. Alfred N. Richards, Philadelphia; Dr. Ross G. Harrison, New Haven, Conn.; Harlow Shapley, Ph.D., Cambridge, Mass.; Mr. Tom K. Smith, St. Louis banker, and Dr. Robbins. The National Science Fund was created recently under the sponsorship of the National Academy of Sciences to receive and administer gifts for the support of fundamental scientific research. It will offer "altruistic people a permanent machinery for wise and fruitful investment in science," it was stated.

MEDICAL NEWS

2807

Special Society Elections.—Dr. James E. Paullin, Atlanta, Ga., was named president-elect of the American College of Physicians at the recent annual meeting in Boston, and Dr. Roger I. Lee, Boston, was installed as president. Vice presidents elected were Drs. David Slater Lewis, Montreal, Que.; Thomas T. Holt, Wichita, Kan., and Samuel E. Munson, Springfield, Ill. The next annual session will be in St. Paul and the tentative dates are April 20-24, 1942.—Dr. John Jay Keegan, Omaha, was elected president of the Society of Neurological Surgeons at its annual meeting in Richmond, Va., May 1-3; Dr. Wilder G. Penfield, Montreal, Que., secretary. The 1942 meeting will be in Boston.—Dr. Harry Goldblatt, Cleveland, was chosen president-elect of the American Society of Clinical Pathologists and Dr. John L. Lattimore, Tonawanda, May 29 to June 2. Dr. Russell L. Haden, Cleveland, was elected vice president and Dr. Alfred S. Giordano, South Bend, Ind., reelected secretary. The Ward Burdick Medal was given to Drs. Harry P. Smith, Emory D. Warner and Kenneth M. Brinkhous, Iowa City, for their studies of vitamin K.—Dr. J. Winthrop Peabody, Washington, D. C., was named president-elect of the American College of Chest Physicians at the annual meeting in Cleveland, May 31-June 2, and Dr. Benjamin Goldberg, Chicago, became president. Other officers elected were Drs. Jay Arthur Myers, Minneapolis, and Grover C. Bellinger, Salem, Ore., vice presidents, and Paul H. Holnipeg, Man., was elected president of the Conference of State and Provincial Health Authorities of North America at the annual meeting in Washington, D. C., recently. Dr. Carl V. Reynolds, Raleigh, N. C., was elected vice president and Dr. Albert J. Chesley, St. Paul, was reelected secretary.

Dr. Love Wins Golf Championship.—Dr. George R. Love of Oconomowoc, Wis., won the championship of the American Medical Golfing Association June 2 at the Cleveland Country Club and the Pepper Pike Club, Cleveland, in a record breaking field of two hundred and forty-three medical golfers. Dr. Love achieved a gross score of 149 for thirty-six holes by shooting three under par on the last nine holes of the difficult Pepper Pike course. He was presented with the Will Walter Trophy by Dr. David H. Houston, Seattle, president of the A. M. G. A. In addition to the trophy a sterling silver bowl was presented to Dr. Love as a permanent prize.

Dr. N. E. Baxter of Bloomington, Ind., won the thirty-six hole handicap championship, winning a leg on the Detroit Trophy and receiving a set of Kroydon irons.

Dr. James J. Marek of Cleveland was runner up champion with a score of 152. He bagged the famous St. Louis Trophy. Other winners in the thirty-six hole gross event were Dr. John M. Murphy, Detroit, and Dr. R. J. Smith, Buffalo.

Dr. J. J. Harrison, Napoleon, Ohio, won the President's Trophy for best net in the championship flight. Other winners were Drs. E. S. Edgerton, Wichita, Kan., and G. T. McKean, Detroit.

Dr. D. A. Williams, Kansas City, won the eighteen hole championship, gaining the Golden State Trophy. The runner up was Dr. L. J. Carson of Cleveland.

The eighteen hole handicap championship went to Dr. R. B. Dunn of Greensboro, N. C. Second place went to Dr. H. D. Chamberlain of McArthur, Ohio, who took home the Atlantic City Trophy.

In the event limited to players 60 years of age and over, the Minneapolis Trophy was won by Dr. Houston. Other winners in this event were Drs. L. L. Iseman, Chicago; W. E. Baker, Des Moines, Iowa, and J. F. Hawkins, Providence, R. I.

Dr. Homer K. Nicoll, Chicago, won the Wendell Phillips Trophy emblematic of championship among the past presidents of the American Medical Golfing Association. Other prize winning scores were turned in by past presidents, Drs. M. M. Cullom, Nashville, Tenn., and E. G. Zabriskie, New York.

The Section event, a new feature this year, included sterling silver pitchers for the Sections on Surgery, Urology and Neurology, presented respectively by Drs. Harry E. Mock, Harry Culver and George W. Hall, all of Chicago.

Dr. T. A. Kyncer, Kansas City, was tops in the surgical section. Dr. L. F. Huffman of Cleveland won the urologic prize and Dr. C. Hunter Sheldon of Los Angeles had the best score among the neurologists.

Other prize winners in the first, second and third flights were Drs. S. E. Gates, Conneaut, Ohio; J. G. Matthews, Spokane, Wash.; H. W. Salter, Cleveland; C. A. Good, Rochester,

Minn.; P. J. O'Connell, Kansas City; W. R. Riddell, Jackson, Ohio; A. L. Ashmore, Wichita, Kan.; J. P. Hudock, Endicott, N. Y.; A. C. McCarty, Louisville, Ky.; J. B. Sampson, Van Wert, Ohio; J. R. Fowler, Spencer, Mass.; H. A. Gestring, Kansas City; G. A. Hoke, Elyria, Ohio; H. C. Marsico, Valloy Adair and A. J. Kirchner of Lorain, Ohio.

Dr. Harry E. Mock, Chicago, was elected president of the American Medical Golfing Association for the next year, Dr. John B. Morgan, Cleveland, first vice president, and Dr. H. V. Hubbard, Plainfield, N. J., second vice president. Bill Burns, Lansing, Mich., was reappointed executive secretary. Dr. Hous-ton, the retiring president, was made a member of the board of directors. The next tournament will be held in Atlantic City in June 1942.

LATIN AMERICA

Prize for Prevention of Blindness.—The National League for the Prevention of Blindness in Brazil recently awarded its National Prize, established by the professional journalists' club of Rio de Janeiro, to the Secretariat of Education and Health of the state of Bahia, with a tribute to the initiative of the secretary, Dr. Isaias Alves, according to the *Medico*. The award was made in recognition of the secretary's work in creating the first class for conservation of vision in one of the primary schools of São Salvador.

Brazilian Congress of Ophthalmology.—Dr. Harry S. Gradle, Chicago, president of the Pan American Congress of Ophthalmology, will be a guest at the fourth Brazilian Congress of Ophthalmology, to be held in Rio de Janeiro, June 26 to July 1. Dr. Gradle will deliver an address on "Glaucoma Capsulare." Prof. Octavio Rego Lopes, Rio de Janeiro, is president of the congress and Dr. Natalicio de Farias, Rio de Janeiro, is secretary. Members of the committee in charge of the scientific program include Drs. Ivo Corrêa Meyer and Santayana Mascarenhas, Porto Alegre; Linneu Silva, Minas Geraes; Moacyr E. Alvaro, Souza Martins and J. J. Britto, São Paulo; Isaac Salazar, Recife; Cesario de Andrade and Francisco Ferreira, Bahia; Paulo Cesar Pimentel, Rio de Janeiro; Deusdedit Coelho Duarte, Pará, and Leonidas Ferreira, Paraná. Official subjects of discussion chosen for the congress are the relationship between ophthalmology and legal medicine, constitution in ophthalmology and vision of school children.

FOREIGN

Personal.—Lieut. Col. George S. Parkinson has been appointed acting dean of the London School of Hygiene and Tropical Medicine. He replaces Sir William Wilson Jameson, who has been appointed chief medical officer of the Ministry of Health.

Rockefeller Foundation War Workers.—Drs. Hugh H. Smith, recently in Bogotá, Colombia, Arnold P. Meiklejohn, Boston, and William D. Robinson, Ann Arbor, Mich., have been appointed members of the Rockefeller Foundation health commission for war work and were to sail for Europe on April 19, according to *Science*. Dr. Smith and Dr. Meiklejohn were to be attached to the British Ministry of Health and Dr. Robinson was to go to Madrid to study nutrition in Spain.

Plastic Surgery in Great Britain.—Nine centers for maxillofacial units are handling this service in the British Army and to these units come cases requiring plastic surgery. Three other units in the London area are under the leadership of Sir Harold D. Gillies, Mr. Archibald H. McIndoe and Mr. Rainsford Mowlem. Sir Harold is in charge of the entire group. Information comes to us to the effect that Sir Harold's home was struck by a bomb and that his eldest son is now a prisoner after a forced landing of his plane.

Social Hygiene Worker Receives Snow Medal.—Mrs. Sybil Neville Rolfe, secretary general of the British Social Hygiene Council, received the William Freeman Snow Award at the recent annual meeting of the American Social Hygiene Association in Philadelphia. Mrs. Rolfe was secretary of the National Council for Combating Venereal Diseases from 1915 to 1925 and continued as secretary general when that organization became the British Social Hygiene Council. The award was accepted for her in her unavoidable absence by her cousin, Dr. Helen Ingleby, Philadelphia. This is the fourth Snow award. The previous recipients were Dr. Edward L. Keyes, New York; Dr. Thomas Parran, surgeon general, U. S. Public Health Service, and Gen. John J. Pershing, Washington, D. C.

BUENOS AIRES

(From Our Regular Correspondent)

March 17, 1941.

Second Pan American Congress for Endocrinology

The second Pan American Congress for Endocrinology met March 5-8 in Montevideo, Uruguay. It was exceptionally well attended. Dr. Juan Cesar Mussio Fournier, minister of public health and director of the Institute of Endocrinology of Montevideo, was chairman. Official delegates were present from the other South American countries. The United States was represented by Drs. Oscar Riddle, George W. Corner, R. L. Zwemer, H. M. Evans and F. C. Koch, with Dr. Elmer Sevringhaus head of the delegation. A scientific exhibit was on display with numerous clinical diagrams, pictures and graphs and an anatomic collection from the physiologic institute of Buenos Aires. Prof. B. A. Houssay pointed out that the progress of endocrinology was hindered by charlatans as well as by endocrinologists who with literary skill and a productive imagination embellished the facts of science. The true progress of endocrinology, however, is due to experimental and clinical research workers whose serious investigations are conducted in the privacy of the laboratory and the ward. In the industrial production of hormones and organotherapeutic products there was a danger that the pressure of material considerations was such as to confuse the distinction between the pure scientist and the industrial technician. Dr. Sevringhaus extended the greetings of the Oficina Sanitaria Panamericana. He called for a closer definition of terminological usage such as that of catalysis, correlation and others.

The sections included those of histology and pathologic anatomy, biology, physiology, internal medicine, cardiology, pediatrics, psychiatry, therapy, radiology, surgery, obstetrics and gynecology, urology, social medicine and dentistry. Dr. Sevringhaus opened the scientific proceedings by discussing the contributions of North American research workers to endocrinology. Professor Houssay discussed insulin secretion and its regulation. Dr. Herbert M. Evans of California spoke on internal secretion of the anterior lobe of the hypophysis. Dr. Riddle of the Carnegie Institute discussed the role which hormones of the hypophysis play in carbohydrate metabolism. Dr. Pou Orfila discussed the syndromes produced by sex hormones in women and stressed the need of basing therapy on clearly determined clinical pictures so as to avoid disturbances arising not from the disease but from mistaken therapy. Dr. E. E. Krapf called attention to grave manifestations of depression in European women who had recently immigrated, occurring in connection with the change in the seasons and with menstrual dysfunction. Dr. Buño spoke on endocrine disturbances in school children on the basis of 1,000 cases, Drs. O. and A. Pichón Riviere treated the subject of oligothymia and endocrine disorders, Dr. Camacho the medicosocial significance of the colloid goiter and Dr. Mira, formerly professor of psychiatry in Barcelona, the present status of endocrine psychoses. Prof. Del Río Ortega discussed the functional structure of the epiphysis.

In the section for physiology, Dr. W. Wolf of the United States discussed the value and determination of basal metabolism. J. A. Collazo, A. Munilla, José M. Jorge and Mario Nirenstein treated the relations between vitamins and hormones. A. V. Di Cío and M. Scheingart discussed the effect of vitamin C on the activity of the testicular hormones. In the section for pediatrics, Dr. Cerviño spoke on temporary forms of hypothyroidism in children. Dr. Cibils Aguirre and his collaborators discussed endocrine disturbances in children and Dr. Perez del Castillo, dystrophy and growth. Drs. Rascovsky, Pichón Riviere and Saltzman schematized the constituent elements of

the prepuberal adiposogenital syndrome in males, based on 100 cases. In the section of cardiology Prof. De Castro of Brazil discussed hypertension and the climacteric. In the combined sections of psychiatry and social medicine Dr. Alcuña and Halperín Pinos reported on the menstruation of Argentinean women in the city of Buenos Aires. Dr. Cantilo and Dr. Esteves Balado discussed the role of endocrine disturbances in schizophrenia; Dr. Gregorio Bermann, hermaphroditism and Drs. L. Fraenkel and Saesser, schizophrenia and infantilism.

In the combined sections of surgery and gynecology, A. Lipschuetz of Santiago de Chile read a paper on the experimental endocrine foundations of the origin of epithelial tumors in the female genital tract. L. Fraenkel and his collaborators discussed the relations between the mammary glands and internal secretions, and Del Castillo, Membrives and De la Balze gynecomastia and pulmonary carcinoma. In the physiologic section, Professor Houssay and Dr. Del Castillo discussed the thymus and the adrenal glands. The National Institute of Nutrition in Buenos Aires was represented by a number of speakers. Prof. Pedro Escudero discussed the effect of nutrition on diabetes in children and the effect of the relations between the fat and carbohydrate content of food on the structure of the pancreas. In the section for biology Dr. Keppler spoke on the diagnosis and treatment of tumors of the adrenal cortex, and Dr. Plá in the section of internal medicine on the function of the thyroid gland.

In the concluding session the memory of Professor Banting, who recently lost his life in an airplane crash, was honored by adoption of a resolution that the picture and a biographic sketch of the deceased be included in the publication of the congress. Two recommendations presented by Dr. Sevringhaus were adopted, namely that the publications in the field of endocrinology appear in Spanish, Portuguese and English and the participation by the congress in the development of standardizing methods analogous to those conducted by the North American Society for the Study of Internal Secretions. The next congress is to meet in 1943 in Buenos Aires under the direction of Prof. Bernardo A. Houssay.

The congress accomplished much in establishing closer relations between North and South American research workers. It was the first time that the two continents held joint sessions in this field of scientific inquiry. The contributions of Professors Evans, Sevringhaus, Corner, Koch, Riddle, Selye of Canada, Martins of Brazil, of the Uruguayan research men and of Bernardo Houssay, Enrique del Castillo, Oscar Arias, Juan T. Lewis and Pedro Escudero were highly appreciated.

Between March 13 and 17, on invitation of the Argentine Society for Endocrinology, lectures were given by Prof. G. W. Corner on the menstrual cycle in monkeys, by Thales Martins of Rio de Janeiro on sex hormones, by E. Kepler on the clinical diagnosis of tumors of the adrenal cortex, by A. Lipschuetz of Santiago de Chile on the experimental endocrine foundations of tumor causation, by H. M. Evans on gonadotropic substances of the hypophysis, by Elmer Sevringhaus on the diagnosis and treatment of the menopause and by A. Selye on alarm reactions. Besides, lectures were delivered on invitation of the medical faculties of Rosario and Córdoba.

Marriages

WILLIAM EDWARD BONES, Pulaski, Va., to Miss June Constance Norris at Melbourne, Australia, June 13.

WALTER A. FENSTERMACHER, Rochester, N. Y., to Miss Dorothy M. Shaw, May 5.

JOHN ELBERT DUNLAP to Miss Marianne Touchstone, both of Dallas, Texas, May 23.

ELLERTON GORDON ALDRICH to Miss Isobel Mary Millar, both of Detroit, May 24.

Deaths

Bransford Lewis * St. Louis; Missouri Medical College, St. Louis, 1884; an Affiliate Fellow of the American Medical Association and a member of its House of Delegates in 1913; lecturer in genitourinary surgery at his alma mater from 1893 to 1895; professor of urology at St. Louis University School of Medicine from 1900 to 1930 and since 1930 professor emeritus; member of the American Association of Genito-Urinary Surgeons; member and past president of the American Urological Association; fellow of the American College of Surgeons; past president of the Mississippi Valley Medical Association; in 1933 vice president of the Pan American Medical Congress; assistant superintendent of St. Louis City Hospital in 1889, on the staff from 1902 to 1905 and from 1910 to 1912; on the staff of the Missouri Pacific Hospital from 1892 to 1896, Rebekah Hospital from 1901 to 1914, Deaconess Hospital from 1905 to 1912, Frisco Hospital from 1898 to 1915; since 1912 urologist to St. John's Hospital; translated from the German "Genitourinary Diagnosis and Therapy for Urologists and General Practitioners," by Dr. E. Portner; co-author of "Cystoscopy and Urethroscopy"; edited a "History of Urology" in 1933, and wrote the chapter on the history of the American Urological Association; contributed largely to the development of the modern cystoscope; aged 78; died, May 18, at his summer home near St. Clair, Mo.

Manford Repp Waltz * Seattle; Northwestern University Medical School, Chicago, 1918; member of the American Laryngological, Rhinological and Otolological Society and the Pacific Coast Oto-Ophthalmological Society; fellow of the American College of Surgeons; on the staffs of the Swedish Hospital, Providence Hospital, Seattle General Hospital and the Children's Orthopedic Hospital; aged 50; died, April 20, of cerebral embolism.

Aurelius Rives Shands, Washington, D. C.; University of Maryland School of Medicine, Baltimore, 1884; member of the Medical Society of the District of Columbia and the Southern Surgical Association; fellow of the American College of Surgeons; past president of the American Orthopedic Association; formerly clinical professor of orthopedic surgery, George Washington University School of Medicine; aged 80; died, April 27, of coronary thrombosis, arteriosclerosis and pneumonia.

Harold Lynwood Warwick * Fort Worth, Texas; University of Georgia Medical Department, Augusta, 1900; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; past president of the Tarrant County Medical Society; served during the World War; on the staffs of St. Joseph's and Methodist hospitals; aged 63; died, April 28, of carcinoma of the bladder.

Alfred Edwin Baker * Richmond Hill, N. Y.; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1906; fellow of the American College of Surgeons; attending obstetrician and gynecologist, Queens General and Jamaica hospitals, Jamaica, and Creedmoor State Hospital, Queens Village; on the associate staff of the Mary Immaculate Hospital, Jamaica; aged 65; died, April 29, of coronary thrombosis.

Lewis Marshall Van Meter * Denver; University of Virginia Department of Medicine, Charlottesville, 1897; fellow of the American College of Surgeons; served during the World War; on the staffs of the Denver General Hospital, Presbyterian Hospital, Mercy Hospital and St. Anthony's Hospital; aged 70; died in April of coronary sclerosis.

Edward Marion Frank Stephen * Galveston, Texas; University of Texas School of Medicine, Galveston, 1916; formerly assistant surgeon in the United States Public Health Service; past president of the Galveston County Medical Society; on the staff of the United States Marine Hospital; aged 54; died, April 25, of hypostatic pneumonia.

Alice Gardner Whittinghill Davis, Owensboro, Ky.; University of Michigan Medical School, Ann Arbor, 1933; member of the Kentucky State Medical Association; formerly secretary of the Daviess County Medical Society; aged 32; died, April 20, in the Owensboro-Daviess County Hospital of toxemia following childbirth.

Jane Drusie McIntosh Wright, Clear Lake, Iowa; State University of Iowa College of Medicine, Iowa City, 1898; member of the Iowa State Medical Society; past president of the State Society of Iowa Medical Women; aged 73; died, April 26, in Mason City of injuries received in a fall in March.

Charles White Berry, Charlottesville, Va.; Columbia University College of Physicians and Surgeons, New York, 1896;

formerly associate professor of clinical pediatrics at the New York Post-Graduate Medical School; served during the World War; aged 70; died, April 30, of aplastic anemia.

Arthur Eddy West, Kalamazoo, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1897; member of the Michigan State Medical Society; aged 66; died, April 22, in the Bronson Hospital of cirrhosis of the liver, arteriosclerosis and heart disease.

Thomas Wynn Morgan * Virden, Ill.; Rush Medical College, Chicago, 1900; served during the World War; aged 62; died, April 9, in the Barnes Hospital, St. Louis, of respiratory paralysis following a cranial operation for Ménière's disease.

Arch Burl Thompson * Milwaukee; University of Louisville (Ky.) Medical Department, 1914; member of the Indiana State Medical Association; on the staff of the Veterans Administration Facility; aged 53; died, April 18, of coronary occlusion.

Delbert S. Wilbur, Naples, N. Y.; Albany Medical College, 1897; member of the Medical Society of the State of New York; for many years health officer and member of the board of education; aged 72; died, April 19, of cerebral meningitis.

William J. L. Millar, Rensselaer Falls, N. Y.; University of Buffalo School of Medicine, 1893; served as health officer of Rensselaer Falls; school physician and a member of the school board; aged 75; died, April 15, of diabetes mellitus.

Clarence Henry Willig, Mars, Pa.; Temple University School of Medicine, Philadelphia, 1933; member of the Medical Society of the State of Pennsylvania; aged 39; died, April 24, in St. Joseph's Hospital, Pittsburgh, of coronary occlusion.

Roland Earl Taylor, Windsor, Ont., Canada; University of Toronto Faculty of Medicine, 1922; served during the World War; on the staffs of the Grace Hospital, Metropolitan General Hospital and the Hotel Dieu; aged 44; died, March 14.

Bernard Joseph Mulholland, Lawrence, Mass.; Baltimore Medical College, 1906; member of the Massachusetts Medical Society; aged 57; died, April 16, in the Mary E. McGowan Memorial Hospital, Methuen, of cirrhosis of the liver.

John William Phares * Evansville, Ind.; Kentucky School of Medicine, Louisville, 1897; fellow of the American College of Surgeons; on the staff of the Protestant Deaconess Hospital; aged 72; died, April 27, of coronary thrombosis.

Louis M. Pearson, Wausau, Wis.; Rush Medical College, Chicago, 1904; member of the State Medical Society of Wisconsin; served during the World War; aged 62; died, April 21, in the Memorial Hospital of chronic myocarditis.

Marion Margaret Wallace * Chicago; University of Illinois College of Medicine, Chicago, 1934; aged 53; died, April 15, in the Women and Children's Hospital of cerebral hemorrhage and hypertensive cardiovascular renal disease.

Louis Ruch, Englewood, N. J.; Cornell University Medical College, New York, 1911; aged 61; on the staff of the Holy Name Hospital and the Englewood Hospital, where he died, April 26, of cerebral hemorrhage and hypertension.

Sam Sharp Templin, Galveston, Texas; University of Texas School of Medicine, Galveston, 1926; instructor in medicine at his alma mater; on the staff of the John Sealy Hospital; aged 48; died, April 15, of coronary thrombosis.

Reuben Golding Blackburn, Marion, S. C.; Medical College of the State of South Carolina, Charleston, 1910; formerly member of the state legislature; aged 62; died, April 9, of diabetes mellitus and coronary arteriosclerosis.

Eugene Theodore Stephenson * * * * * George Washington University School of Medicine, 1907; member of the Medical Society of * * * * * bmbia; aged 68; died, April 12, of coronary thrombosis.

George Spencer Lape, Binghamton, N. Y.; Albany Medical College, 1904; member of the Medical Society of the State of New York; aged 62; died, March 11, of arteriosclerosis, Parkinson's syndrome and cerebral thrombosis.

Joseph Michael O'Maley, Miami, Fla.; Miami Medical College, Cincinnati, 1909; served during the World War; aged 68; died, April 11, in St. Francis Hospital, Miami Beach, of coronary sclerosis and bronchopneumonia.

Sarah Felt Richardson, Munfordville, Ky.; Hering Medical College, Chicago, 1898; member of the Kentucky State Medical Association; secretary of the Hart County Medical Society; aged 70; died, April 7.

Hosea M. Rymer, Harrisville, W. Va.; University of Louisville (Ky.) Medical Department, 1893; member of the West Virginia State Medical Association; aged 71; died, April 15, of angina pectoris.

James Wilbur Brandon, Big Clifty, Ky.; University of Louisville (Ky.) Medical Department, 1906; member of the Kentucky State Medical Association; aged 59; died, April 30, of cerebral hemorrhage.

Charles K. Kernan, Pulaski, Va.; University of Maryland School of Medicine, Baltimore, 1887; aged 79; died, April 18, in the Southwestern State Hospital, Marion, of arteriosclerosis and pulmonary tuberculosis.

Arthur Alexander Johnston Simpson, Kintail, Ont., Canada; M.B., Victoria University Medical Department, Coburg, 1903; M.D., Trinity Medical College, Toronto, 1904; aged 77; died, March 21.

William A. Starkey, Atlanta, Texas; Gate City Medical College, Texarkana, Ark., 1906; member of the State Medical Association of Texas; aged 71; died, April 21, of myocarditis and hypostatic pneumonia.

Constantinos N. Lyras, Long Beach, N. Y.; National University of Athens School of Medicine, Greece, 1895; aged 68; died, March 22, of cerebral arteriosclerosis, bronchopneumonia and hypertension.

Ritchie Christian Ovens, Jersey City, N. J.; New York Homeopathic Medical College and Hospital, New York, 1901; served during the World War; aged 62; died, April 11, of cerebral hemorrhage.

William Robertson, Elora, Ont., Canada; McGill University Faculty of Medicine, Montreal, Que., 1890; for many years medical officer of health for Pilkington township; aged 76; died, March 30.

Hugh James White ♂ Hammond, Ind.; Northwestern University Medical School, Chicago, 1906; served during the World War; aged 61; died, April 21, in St. Margaret's Hospital of pneumonia.

Joseph B. Shannon, Fort Worth, Texas; Maryland Medical College, Baltimore, 1905; member of the State Medical Association of Texas; aged 59; died, April 19, of aneurysm and arteriosclerosis.

Roger Francis Murray, Union City, N. J.; Georgetown University School of Medicine, Washington, D. C., 1930; on the staff of St. Mary's Hospital; aged 37; died, April 14, of heart disease.

Herschel S. Lowrance, Topeka, Kan.; American Medical College, St. Louis, 1881; for many years on the staff of the Kankakee (Ill.) State Hospital; aged 85; died, April 12, of myocarditis.

Jerome Lloyd Silverstein, San Francisco; Stanford University School of Medicine, 1939; intern at the Stanford University Hospitals; aged 26; died, March 30, of bronchopneumonia.

William Richard Sears, Brooklyn; Long Island College Hospital, Brooklyn, 1900; served during the World War; at one time a ship's surgeon; died, April 18, in the Kings County Hospital.

Berthold F. Bertram ♂ Detroit; Michigan College of Medicine and Surgery, Detroit, 1892; aged 70; died, April 30, in St. Joseph Hospital of acute dilatation of the heart and hypertension.

William Penn Sims ♂ Burkburnett, Texas; College of Physicians and Surgeons, Memphis, Tenn., 1911; served during the World War; aged 52; died, March 19, of coronary occlusion.

Edwin Alonzo Clark, Los Angeles; Western Reserve University Medical Department, Cleveland, 1890; aged 77; died, March 21, of arteriosclerosis, hypertension and heart disease.

Paul Edouard Garneau, Quebec, Que., Canada; Laval University Faculty of Medicine, Quebec, 1924; professor of descriptive anatomy at his alma mater; aged 43; died, March 11.

Fred B. Kell, San Bernardino, Calif.; St. Louis University School of Medicine, 1913; member of the California Medical Association; aged 53; died, April 23, of coronary sclerosis.

Delphine Hanna, Castile, N. Y.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1890; aged 86; died, April 16, in the Greene Sanitarium of arteriosclerosis.

Albert Tennyson Webb, Santa Barbara, Calif.; University of Pennsylvania Department of Medicine, Philadelphia, 1891; also a dentist; aged 75; died, April 28, in Las Vegas, Nev.

William Frank Neide ♂ Seaford, Del.; Hahnemann Medical College and Hospital of Philadelphia, 1931; aged 35; died, April 13, in the Mound Park Hospital, St. Petersburg, Fla.

Elijah Leonard Hardman, Allerton, Ill.; Western Reserve University Medical Department, Cleveland, 1891; aged 78; died, April 21, in the Carle Memorial Hospital, Urbana.

Frederic Clarence Calvert, San Diego, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1908; aged 57; died, March 16, of pulmonary embolism.

William Spencer Richards, Buffalo; University of the City of New York Medical Department, 1889; aged 74; died, March 6, of cardiovascular renal disease and uremia.

Alexander Penrose Forbes Gammack, South Bend, Ind.; University of Aberdeen Faculty of Medicine, Scotland, 1889; aged 73; died, April 20, of congestive heart disease.

William Ford Ward, Binghamton, N. Y.; Hahnemann Medical College and Hospital of Philadelphia, 1897; aged 67; died, March 11, of rheumatic cardiovascular disease.

Lillian Boldemann, San Francisco; Hahnemann Hospital College of San Francisco, 1896; aged 69; died, March 19, of heart disease and carcinoma of the stomach.

William F. Sibbett, Douglas, Ga.; Atlanta Medical College, 1888; member of the Medical Association of Georgia; at one time mayor; aged 87; died, March 11.

Samuel Bismarck McLeary, Columbus, Texas; Jefferson Medical College of Philadelphia, 1889; aged 74; died, April 3, of arthritis deformans and arteriosclerosis.

John Paul Stawicki, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; aged 61; died, April 18.

John Jay Williams, St. Louis; College of Physicians and Surgeons, Keokuk, Iowa, 1878; aged 88; died, April 23, of chronic myocarditis and arteriosclerosis.

Horace Percy Wilkins, Birmingham, Ala.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1887; aged 74; died, March 5, in Miami, Fla.

Wenceslao Olvera Zuniga, Los Angeles; Universidad Nacional Facultad de Medicina, Mexico, D. F., 1909; aged 58; died, March 3, of a ruptured spleen.

Fred A. Perrigo, Huntington Park, Calif.; Hahnemann Medical College and Hospital, Chicago, 1898; aged 73; died, March 29, of coronary thrombosis.

Frank Hastings Starr, Corning, N. Y.; Bellevue Hospital Medical College, New York, 1889; aged 76; died, April 16, of cardiac decompensation and uremia.

Benjamin Alexis Sherrell, Deltrose, Tenn.; Vanderbilt University School of Medicine, Nashville, 1892; aged 79; died, April 15, of cerebral hemorrhage.

William H. Murray, Waterbury, Conn.; Bellevue Hospital Medical College, New York, 1890; aged 76; died, April 22, of chronic myocarditis.

George W. B. Swaim, Seattle; Missouri Medical College, St. Louis, 1885; aged 83; died, April 12, of bronchopneumonia and chronic myocarditis.

John Andrew Kane, Cobalt, Ont., Canada; L.R.C.P., L.R.C.S., Edinburgh, and L.F.P.S., Glasgow, Scotland, 1906; aged 63; died, March 8.

John Edward Sutton ♂ Albion, N. Y.; University of Buffalo School of Medicine, 1883; aged 85; died, April 17, of cerebral hemorrhage.

Alfred P. Rainier, Remington, Ind.; St. Louis College of Physicians and Surgeons, 1903; aged 62; died, April 11, of secondary anemia.

Julia A. Meyer, Los Angeles; Homeopathic Medical College of Missouri, St. Louis, 1904; aged 75; died, March 9, of arteriosclerosis.

Elwin Wilder Gammon, Orlando, Fla.; Rush Medical College, Chicago, 1892; aged 74; died, April 23, in Fort Lauderdale.

John Fraser Lockwood, Whittier, Calif.; Albany (N. Y.) Medical College, 1881; aged 86; died, March 2, of coronary thrombosis.

Thomas Walter Blanshard, Burlington, Ont., Canada; University of Toronto Faculty of Medicine, 1905; died, March 12.

Gustave Paul Gehring, San Diego, Calif.; Jefferson Medical College of Philadelphia, 1890; aged 84; died, March 15, of senility.

Leonard G. Cromer, Union City, Ind.; Medical College of Ohio, Cincinnati, 1890; aged 82; died, April 29.

Carrie Yetter, San Francisco; California Medical College, San Francisco, 1890; aged 86; died, March 5.

B. Wilbur Breedlove, Downs, Ala.; Atlanta (Ga.) Medical College, 1893; aged 68; died, April 30.

Bureau of Investigation

CEASE AND DESIST ORDERS Abstracts of Certain Federal Trade Commission Releases

The work of the Federal Trade Commission, in helping to protect the public against misrepresentation or fraud in the medical as well as other fields, has been greatly extended by the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act. The Food, Drug and Cosmetic Act of 1938 added to the Food and Drug Administration's control of the advertising claims and statements made on the labels of medicines or on the carton or in the accompanying leaflet, whereas what might be termed collateral advertising, that which appears in newspapers and magazines and over the air, comes more actively under the purview of the Federal Trade Commission, by virtue of the Wheeler-Lea Amendment.

THE JOURNAL has at various times commented on the activities of the Federal Trade Commission in this connection, even before the Wheeler-Lea Amendment gave it its added rights. In some cases the Commission may accept from the person or concern involved a stipulation that the objectionable practices or claims cited will be discontinued. In other cases the Commission issues what is known as a Cease and Desist Order, in which the individual, manufacturer or distributor cited is ordered to cease and desist from practices which have been declared objectionable.

Abstracts of some of the orders issued during 1940 follow:

"Man's" Products.—Edward L. Leisenring, trading as U. S. Drug and Sales Company, U. S. Drug Laboratories and U. S. Drug Company, and Gordon Leisenring, both of Denver, put out some products under this brand. Apparently all were essentially the same except for being sold in different strengths. The names used were "Man's Tonic," "Man's Pep Tonic," "U. S. Special Tablets" and "Sextogen Capsules for Men or Women." On June 17, 1940, the Federal Trade Commission, having found false claims in the advertising, ordered the defendants to cease and desist from further representing that their preparations are safe, competent or reliable tonics or aphrodisiacs, or are scientific treatments for strengthening or rejuvenating the glands or sexual organs of men or women, or that these products have any value in the treatment of debility, or to fail to make clear in the advertising that these products may result in serious or irreparable injury to the health of the user.

Monticello Drug Company.—On July 6, 1940, this Jacksonville, Fla., concern was ordered by the Federal Trade Commission to cease and desist from representing that its preparations check, cure or stop colds; constitute a complete treatment for colds, whether taken or administered singly or in conjunction with each other; cure malaria, or are the speediest remedies known for colds, malaria, chills and fever, or bilious fever due to malaria. The order also forbids representations that the respondent's preparations are commonly prescribed by physicians. The Bureau of Investigation's records show that this concern puts out something called "666" in three forms—liquid, tablet and salve. In May 1935 the government declared that the salve was sold under fraudulent claims as an alleged remedy for catarrh, chills, streptococcal infections and some other things. The government chemists reported that it was composed essentially of volatile oils, including those of camphor, menthol and eucalyptus, and a coniferous oil, such as cedar leaf oil, in petrolatum. The Ohio Dairy and Food Division once reported finding the "666 Liquid" to be a watery solution containing citric acid, iron, manganese and quinine.

Periodic Relief Pills.—These were put out as a remedy for delayed menstruation by one William W. Kelso, Seattle, trading as Northwestern Products Company and as Northwestern Health Clinic. Kelso was ordered by the Federal Trade Commission on July 1, 1940, to discontinue any advertisements of his product that failed to reveal that its use might result in serious and irreparable injury to health.

Pow-O-Lin.—This product was put out by the Herb Juice-Penol Company, Inc., trading as Pow-O-Lin Laboratories, Danville, Va. It was dealt with at some length in THE JOURNAL, June 25, 1938, page 2170. That article disclosed that from the A. M. A. chemists' report it was concluded that the nostrum was essentially a water-alcohol solution of plant extracts flavored with licorice. The article also brought out that the Federal Trade Commission on Dec. 23, 1937, had represented that the Pow-O-Lin people had signed a stipulation with the commission to cease advertising that "Pow-O-Lin" was "capable of relieving biliousness, nervousness, indigestion and countless ills due to constipation, unless these assertions are limited to temporary relief from constipation." Apparently the concern did not discontinue all its advertising misrepresentations, however, for on June 10, 1940, the Commission issued a definite order directing this outfit to cease and desist from implying certain things unwarrantedly. Among these were that Pow-O-Lin is a cure or remedy for constipation and "faulty elimination" characterized by and associated with symptoms such as biliousness, indigestion, gas pains, headaches, dizziness, pains in the back or chest, stiffness of the joints, swollen feet or ankles, nervousness, insomnia, loss of appetite or lack of energy.

Medical Examinations and Licensure

COMING EXAMINATIONS NATIONAL BOARD OF MEDICAL EXAMINERS EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and Examining Boards in Specialties were published in THE JOURNAL, June 14, page 2714.

BOARDS OF MEDICAL EXAMINERS

ARIZONA: Phoenix, July 1-2. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.

CALIFORNIA: Oral examination (required when reciprocity application is based on a state certificate or license issued ten or more years before filing application in California), Los Angeles, July 14. Written. San Francisco, June 30-July 3. Sec., Dr. Charles B. Pinkham, 1020 N St., Sacramento.

CONNECTICUT: Medical. Written. Hartford, July 8-9. Endorsement. Hartford, July 22. Sec., Dr. Creighton Barker, 258 Church St., New Haven. Homeopathic. Derby, July 15-16. Sec., Dr. Joseph H. Evans, 1488 Chapel St., New Haven.

DELAWARE: July 8-10. Sec., Medical Council of Delaware, Dr. Joseph S. McDaniel, 229 S. State St., Dover.

FLORIDA: Jacksonville, June 23-24. Sec., Dr. William M. Rowlett, Box 786, Tampa.

HAWAII: Honolulu, July 14-17. Sec., Dr. James A. Morgan, 48 Young Bldg., Honolulu.

IDAHO: Boise, Oct. 7. Dir., Bureau of Occupational License, Mr. Walter Curtis, 355 State Capitol Bldg., Boise.

ILLINOIS: Chicago, June 24-26. Supt. of Registration, Mr. Lucien A. File, Department of Registration and Education, Springfield.

MAINE: Augusta, July 1-2. Sec., Board of Registration in Medicine, Dr. Adam P. Leighton, 192 State St., Portland.

MASSACHUSETTS: Boston, July 8-11. Sec., Board of Registration in Medicine, Dr. Stephen Rushmore, 413-F State House, Boston.

MISSISSIPPI: Jackson, June 25-26. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson.

MONTANA: Helena, Oct. 6-8. Sec., Dr. Otto G. Klein, First National Bank Bldg., Helena.

NEVADA: Reciprocity with oral examination, Aug. 4. Sec., Dr. Fred M. Anderson, 215 N. Carson St., Carson City.

NEW HAMPSHIRE: Concord, Sept. 11-12. Sec., Board of Registration in Medicine, Dr. T. P. Burroughs, State House, Concord.

NEW MEXICO: Santa Fe, Oct. 13-14. Sec., Dr. Le Grand Ward, 135 Sena Plaza, Santa Fe.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 23-26. Chief, Bureau of Professional Examinations, Mr. Herbert J. Hamilton, 315 Education Bldg., Albany.

NORTH DAKOTA: Grand Forks, July 1-4. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OREGON: Portland, July 24-26. Final date for filing application is July 9. Exec. Sec., Miss Lorraine M. Conlee, 608 Failing Bldg., Portland.

PENNSYLVANIA: Philadelphia and Pittsburgh, July 8-12. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. Marguerite G. Steiner, 358 Education Bldg., Harrisburg.

RHODE ISLAND: July 10. Acting Chief, Division of Examiners, Mr. E. Clyde Thomas, 366 State Office Bldg., Providence.

SOUTH CAROLINA: Columbia, June 23-25. Sec., Dr. A. Earle Boozer, 505 Saluda Ave., Columbia.

SOUTH DAKOTA: Pierre, July 15-16. Dir., Medical Licensure, Dr. J. F. D. Cook, State Board of Health, Pierre.

WASHINGTON: Seattle, July 21-23. Sec., Department of Licenses, Mr. Nelson N. Vaughan, Olympia.

WEST VIRGINIA: Wheeling, July 7-9. Sec., Public Health Council, Dr. C. F. McClintic, State Capitol, Charleston.

WISCONSIN: Milwaukee, June 24-27. Sec., Dr. H. W. Shutter, 425 E. Wisconsin Ave., Milwaukee.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

DISTRICT OF COLUMBIA: Washington, Oct. 20-21. Sec., Dr. George C. Ruhland, 203 District Bldg., Washington.

IOWA: Des Moines, July 8. Dir., Division of Licensure and Registration, State Department of Health, Mr. H. W. Grefe, Capitol Bldg., Des Moines.

NEBRASKA: Lincoln, Oct. 7-8. Dir., Bureau of Examining Boards, Mrs. Jeannette Crawford, 1009 State Capitol Bldg., Lincoln.

OREGON: Corvallis, July 12. Sec., State Board of Higher Education, Mr. Charles D. Byrne, University of Oregon, Eugene.

RHODE ISLAND: Providence, Aug. 20. Acting Chief, Division of Examiners, Mr. E. Clyde Thomas, 366 State Office Bldg., Providence.

WASHINGTON: Seattle, July 17-18. Sec., Department of Licenses, Mr. Nelson N. Vaughan, Olympia.

Iowa Reciprocity Report

The Iowa State Board of Medical Examiners reports 9 physicians licensed to practice medicine by reciprocity from January 10 through March 14. The following schools were represented:

School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
Loyola University School of Medicine	(1929)	Illinois
Northwestern University Medical School	(1938)	Minnesota
University of Kansas School of Medicine	(1923)	Kansas
College of Physicians and Surgeons of Baltimore	(1908)	W. Virginia
John A. Creighton Medical College	(1915)	Nebraska
University of Nebraska College of Medicine	(1916), (1934)	Nebraska
Temple University School of Medicine	(1932)	Penn.
University of Wisconsin Medical School	(1928)	Wisconsin

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts: Unlicensed Practice of Chiropractic; Entrapment.—Although not possessing a license to practice medicine in the state of Texas, the defendant had, nevertheless, been engaged in the practice of chiropractic in that state for sixteen years. An investigator for the Texas State Board of Medical Examiners noticed a sign in front of the defendant's home which read "J. M. Peery, Chiropractor" and discovered that the defendant was not registered with the county clerk as required by law. The investigator made arrangements with a woman to apply to the defendant for treatment and gave to her \$2 to pay for the treatment. In a subsequent prosecution of the defendant for practicing medicine without a license, this woman testified that the defendant had treated her for bronchitis, the treatment consisting, among other things, of placing the patient on a cot and connecting "her body up with some kind of an electrical machine." The witness also testified that she paid the defendant \$2 for the treatment. The defendant denied having received any money for his services but admitted that he gave the treatment and that he did not possess a license to practice medicine. From a verdict of guilty in the trial court, the defendant appealed to the court of criminal appeals of Texas.

The defendant contended, among other things, that the prosecution was the result of an entrapment. But, said, the court of criminal appeals, entrapment has been legally defined as "the seduction or improper inducement to commit a crime, and not the testing by trap, trickiness, or deceit of one suspected." It carries with it a presumption that the officer or agent manufactured the offense and then incited the accused into committing it for the purpose of prosecution. The evidence in this case, however, showed that the defendant, by virtue of the sign in front of his house, held himself out to the public as a chiropractor willing to accept patients. The woman who applied for treatment was actually suffering from bronchitis. She did not know that the defendant was violating the law and knew nothing of the investigator's connection with the board of medical examiners or of his motive in referring her to the defendant and paying for her treatment. The gist of the charge against the defendant was that he practiced medicine without a license. This offense was clearly proved, in the opinion of the court, and merely furnishing money to a person and telling her to go to the defendant for treatment did not constitute entrapment. The defendant's conviction was therefore sustained. —*Peery v. State*, 134 S. W. (2d) 283 (Texas, 1939).

Malpractice: Right of Physician to Restrict Area of Practice.—The defendants were associated in the practice of medicine. They limited the area of their practice by customarily refusing to accept or treat a patient residing more than 8 miles from the locality in which their office was located. A woman sustained a severe cut on her leg and was taken to the defendants' office, where proper treatment was administered. The patient was told to return to the office the following day. This she did not do. On the contrary, she and her husband decided to go to a community 20 miles distant to the home of the husband's brother. The condition of the patient's leg became worse and the husband telephoned the defendants several times. At first certain home treatments were suggested but later, on being requested to make the 20 mile trip to see the patient, the defendants suggested that the services of another, more conveniently located physician be obtained. One of the defendants made arrangements for another physician to see the patient but before this physician could respond to the call the husband had made other arrangements. The wound on the patient's leg became infected and she was removed to a hospital, where she remained, seriously ill, for about three months. Subsequently the patient and her husband sued the defendants, contending, among other things, that the defendants failed in their duty to the patient by refusing to make the 20 mile trip to continue

treatments. From a judgment for the defendants, the plaintiffs appealed to the district court of appeal, fourth district, California.

The relation of physician and patient, said the court, is in its inception created by contract, express or implied. The contract may be general or may be limited by special terms. When general, the physician may undertake the treatment of the patient during the course of an illness wherever the patient may be, but a physician is under no obligation to enter into such contract. He may limit his obligation to undertaking to treat the patient only for a certain ailment or injury at a certain place and at a specified time. When he so limits his employment the physician is not required to treat the patient at another place or to follow him into another city. In speaking of a contract of employment of a physician it was said in *Roos v. Jansen*, 30 Cal. App. Supp. 2d 773, 78 P. (2d) 476: "In the absence of a special agreement as to the place where a contract is to be performed, it is to be deemed performable at the creditor's place of business . . . or, in the absence of a contrary showing, a contract is to be deemed performable where it is made." The plaintiffs in the present case complained of instructions given by the trial court which in effect told the jury that as the contract to treat the patient was made in the community in which the office of the defendants was located it followed that it was to be performed there and that in the absence of proof of a contract to treat her elsewhere or general contract for treatment until she was cured, there was no obligation on the part of the defendants to follow her to the community to which she moved. One of the defenses interposed by the defendants was that the contract of employment was special and limited to the treatment of the patient in the office of the defendants. There was, the court said, considerable evidence admitted in support of this defense, and the defendants were entitled to proper instructions on this phase of the case.

It is well settled in California, continued the court, that physicians are required only, in treating a patient, to possess and use the ordinary training, skill and care of other ordinarily prudent, careful and skillful physicians practicing in the same or similar communities. It is equally well settled that the standards of practice in a community can be established only by the testimony of experts. No physician, other than the defendants, who was familiar with the standards of practice in the community in which the treatment was given testified in this case, and the defendants were not interrogated on this subject. The plaintiffs produced two physicians as witnesses who had never practiced in that community and knew nothing of the standards of practice there. Neither did they know that the two communities involved in this case were similar or had similar standards of practice. Over the objections of the defendants they were permitted to testify as to the standards of practice in the community to which the patient moved. They were not able to testify that the same standards prevailed in the defendants' community. It was clear to the court that this evidence was incompetent for any purpose. It should not have been received, for it did not prove that the defendants failed to use due care in treating the patient. Without proof of the lack of such due care, the plaintiffs made out no case.

The court could find no error in the record and therefore affirmed the judgment for the defendants. —*McNamara v. Emmons*, 97 P. (2d) 503 (Calif., 1939).

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Epidemic Diarrhea of Newborn.—Lyon and Folsom discuss the epidemic of diarrhea of the newborn which occurred during August 1938 in the nursery of a general hospital, the third since its opening in 1924. The December 1926 and October 1934 epidemics were carefully studied for the usual dysentery bacilli, but none were isolated. The 1938 epidemic appeared similar in every respect to the first two, except that more infants were involved and that it was more severe. The authors believe that there is a difference between bacillary dysentery of the newborn and the diarrhea of the three epidemics. The term "epidemic diarrhea of the newborn" as used by them connotes the same clinical and epidemiologic picture of the highly fatal diarrhea of the newborn described by Rice, Best, Frant and Abramson. After the sudden death of the first infant, successive cases occurred, so that of the 21 newborn possibly exposed, only 6 escaped. Of these 2 left the hospital soon after the epidemic began, and 2 born after isolation measures were instituted were kept away from the nursery and the infants had diarrhea (frequent, small, thin stools), it was not of the voluminous watery type which rapidly dehydrates older infants suffering from infectious diarrheas. The first few loose stools were watery, but thereafter they were consistently small in amount, although their number ranged from ten to thirty a day. After the first twenty-four to forty-eight hours they were generally small spots of mucus with some yellowish or greenish discoloration. In most of the infants a distinct redness, with injection, of the mucous membranes of the oropharynx and of the conjunctivas was observed. Only the first infant had any purulent discharge from the nose or throat. After twenty-four to forty-eight hours of moderate and not excessively dehydrating looseness of the stool the more severely affected infants became suddenly and acutely prostrated, had high temperatures (103 F. or higher) and lost from 8 to 12 ounces (227 to 340 Gm.) in weight. The symptoms were not primarily of respiratory or intestinal difficulties but of intracranial involvement. Postmortem examination of 3 of the next 8 newborn infants to become acutely ill revealed severe

generalized edema of the brain. This was undoubtedly the most important pathologic observation. The entire brain appeared to have been affected by a severe toxin or by an active neurotropic virus. A tendency to pinpoint hemorrhage was observed in the brain and most of the other organs, especially of central nervous system tissue. The mucosa of the large and small intestine of 2 infants was markedly denuded. There were no membranes or mucous casts; the appearance of the mucosa of 1 infant suggested a catarrhal infection. The atony of the intestine was remarkable. The mesenteric glands were moderately enlarged and hyperplastic. There were numerous minute hemorrhages beneath the mucosa. Microscopically there was evidence of bacterial life or invasion. Cultures for the usual pathogenic enteric organisms were negative. Of 16 infants attacked, 5 died. Of the 11 who recovered, the illness of 5 was severe, of 2 moderately severe and of 4 mild. There was an unusual prevalence of clinical influenzal infections within the community during all three epidemics. That the malady is an expression of infection with influenza virus in the newborn is suggested but not proved. Citrated whole blood from a patient recently convalescent from influenza seemed to be beneficial to 3 of the most severely ill infants. Normal adult blood given to 3 patients had no such effect. Clinical observations suggest that a mother may be infected by her own ill infant and that her response to the infection may be a clinical influenza. Whatever the infective agent, its rapid passage through the physiologically and immunologically immature newborn infant makes it likely that an infective agent relatively common among the general population may be so enhanced in virulence as to produce "epidemic diarrhea of the newborn." Such cases may occur individually and go unrecognized because of their distracting symptoms. The authors suggest that the disease is not new and that previously it was probably confused with true primary infection of the gastrointestinal tract. Since the preparation of the article, Lyon has encountered 2 newborn infants, delivered in relatively remote rural homes, who died of what appeared to be the same clinical picture of diarrhea, fever and symptoms referable to the central nervous system.

Encephalitis Complicating Measles.—Hamilton and Hanna correlate data from 241 cases of encephalitis complicating measles that have been reported by 110 workers and the 44 additional cases observed by them. Either the incidence of the complication is increasing or the disease is more generally recognized. Its pathogenesis is not known. The severity of the infection, the age, the sex, the race or body type of the patient, the season and other factors appear to have no bearing. The pathologic changes are mostly of vascular origin. Hyperemia, engorgement and hemorrhage are seen in the meninges, the spinal cord or the brain; the hemorrhages are usually petechial, the blood vessels have thickened walls and the perivascular regions show, by special staining techniques, the proliferated cells to be largely microglial cells. The age incidence parallels that of measles; more than one half of the cases precede the measles rash, occur with it or appear at varying periods after it. In the authors' cases it always appeared after (average two and seven-tenths days) the rash save in 1 instance, in which symptoms began five days before the rash. Onset prior to the rash is not usual; it occurred in 16 of the previously reported cases. Symptoms vary according to the severity of the involvement and the portion of the nervous system attacked. The sensorium and cranial peripheral, visceral and sensory nerves can be affected. Fever is usual though not invariably. The cranial nerves are more commonly affected than the peripheral nerves. Signs of meningeal irritation are common. The most common single sign is stiffness of the neck, and next in frequency is Kernig's sign. Laboratory data differ widely. The prognosis of any individual case is uncertain, as the disease may progress, regress or remain stationary. Hyperpyrexia of rapid onset with constant increase was present in about half of the fatal cases; progressive bulbar paralysis was also a serious symptom. Very young patients seem to have the poorer prognosis; otherwise the age incidence of mortality closely parallels that of the disease. The prognosis for sequelae is also uncer-

tain. Any of the neurologic symptoms may become permanent or may persist for a long time before recovery ensues. Residual symptoms do not seem especially likely in patients with a severe acute phase of the illness. Severe paralysis or paresis tends to remain in about 10 per cent and convulsive states and choreiform or athetoid movements in about 5 per cent of the patients. In general, of 10 patients 4 will recover completely, 2 will die and 4 will have one or more major or minor debilitating residual symptoms. Therapy other than symptomatic is variable and unsatisfactory. The authors have had some encouraging results with shock treatment. Of 16 patients treated 3 recovered completely within seventy-two hours, 2 recovered within one week, 1 in two weeks, 1 in three weeks, 2 in from four to six weeks, 4 could not be followed satisfactorily, 2 recovered with residual symptoms and 1 died. Of 18 patients given symptomatic treatment 3 made rapid, uneventful recoveries within seventy-two hours with no residual symptoms, 4 attained complete recovery in one week, 1 in two weeks, 2 in more than two weeks, 1 left the hospital against advice with no improvement at the end of a week, 2 left the hospital with paresis of the extremities and 5 died. The remaining 10 patients received one or more of the following: convalescent measles serum, human convalescent poliomyelitis serum and immunotransfusion; 4 of them recovered without residual symptoms in one week, 1 recovered completely in six weeks and 5 died. There were 47 deaths among the 241 cases collected from the literature.

Vitamin E in Treatment of Fibrositis.—Steinberg gave from 2 to 8 cc. of wheat germ oil daily to 82 patients with various disorders. Thirty patients with primary fibrositis were treated with vitamin E in doses of from 2 to 8 cc. daily and all were completely relieved of symptoms. Two of this group

obtained only mild relief after taking 3 cc. of wheat germ daily for four weeks. They were then given a vitamin E molecular distillate containing 120 mg. of naturally occurring alpha-tocopherol daily, and after one week of such therapy they were completely relieved. Of 20 patients with atrophic arthritis with secondary fibrositis given from 2 to 8 cc. of wheat germ daily for from two to four months, 8 noticed definite improvement in muscle soreness and stiffness and 12 experienced no relief. Twenty patients with hypertrophic arthritis with secondary fibrositis were given from 2 to 6 cc. of wheat germ daily for from two to six months and none noticed improvement in the soft tissue structures. Of the 12 remaining patients, 1 with gout was given 4 cc. of wheat germ daily for four weeks without relief from the extreme muscle soreness, 3 with sciatica of unknown cause were given 4 cc. for four weeks without relief and 8 with "psychosomatic rheumatism" received wheat germ oil for from two to three months without relief. These were all later relieved by barbiturate or bromide therapy. The studies tend to indicate that primary fibrositis may be a metabolic rather than an infectious process.

Small Intracutaneous Veins in Chest.—In examining 385 patients for the presence of ectasia of small intracutaneous veins in the region of the pleural sinuses, Burrett and Scherf found that they are not the result of pulmonary, pleural or cardiac disease. They are found in healthy people and their incidence increases with age. The 385 patients represented miscellaneous clinical material and were unselected, but the group intentionally included many instances of pulmonary and cardiac disease because of the supposed relationship of such veins to these conditions. Ectasia of only intracutaneous veins, more or less dendritically arranged, at the level of the pleural sinuses or round the last cervical and first to fifth dorsal vertebral spines was looked for. Such veins were present in 261 (67.7 per cent) of the 385 patients examined. Their incidence definitely increased among older subjects. Among 29 patients less than 20 years of age the veins were present in 14 (48.2 per cent), while they were observed in 46 (76.6 per cent) of 60 subjects 60 or more years of age. These veins were present in only 28 (51.8 per cent) of 54 patients with pulmonary disease (tuberculosis, emphysema and bronchitis). Among 94 decompensated cardiac patients examined (coronary sclerosis, rheumatic heart disease, syphilitic aortitis and hypertension) the veins were detected in 66 (70.2 per cent). Of 35 patients with visible pleural adhesions on fluoroscopic examination 10 (20.8 per cent) failed to exhibit superficial chest veins, in 6 the veins were present only on the side opposite to the adhesions and in 5 they were more prominent on the side of the adhesions. Among 137 patients with diabetes, peptic ulcer and other diseases but without demonstrable pulmonary or cardiac disease the veins were detected in 95. Among 261 positive cases, they were bilateral in the region of the phrenicocostal sinus in 103 (39.5 per cent). The study shows that the phlebectases follow the borders of the pleural sinus, are more definitely in evidence at the lower anterior pulmonary margin and are most common on the left side. In 155 of 246 patients displaying veins anteriorly, fluoroscopic study revealed that these structures were located exactly at the attachment of the diaphragm. There was no relation to this muscle in 5. Whenever the veins were above or below the contact area, a definite reason for the exception was found. For example, they were above in patients whose diaphragms were low or horizontal (enteroptosis, pulmonary emphysema) and below when the skin had been stretched by large pendulous breasts or a recent marked reduction of weight had occurred. The author offers the following explanation for the developmental mechanism of these veins. Any sudden physical exertion such as running up a flight of stairs, cough, pressure during defecation, even bending, causes increased intrathoracic pressure. The transmission of this increased pressure may be prevented in some areas by venous valves. The fact that these veins are more or less limited to the borders of the pleural sinuses may be due to a special arrangement of the veins and their communication with the superficial vessels at these locations. The available knowledge concerning intrathoracic pres-

tures at different areas under normal and abnormal conditions is meager. The fact that bullae in advanced emphysema usually occur at the apexes, the anterior margin of the lung and at the bases, that is, at the same sites at which the "pleural sinus veins" appear, may be the result of a special elevation of pressure in these areas during cough or pressure. The author believes that knowledge of the existence of these structures, their high incidence and their exact location may have some importance, as they readily indicate the site of the pleural sinuses; this may aid in the differential diagnosis of some intrathoracic diseases.

*Relationship of Arthritis to Oral Diagnosis, Defocalization and Streptococcus Vaccine Therapy. M. Shuster, New York.—p. 149.

Relationship of Arthritis to Oral Infection.—Shuster points out that in recent years the focal infection theory of chronic arthritis has been the target of much criticism. The results of defocalization have not always lived up to expectation, and some workers do not advise dependence on this treatment in such joint conditions. The author believes this view is based on a misconception of the theory. That such treatment deserves an important place in the therapy of chronic infectious arthritis is shown by his results obtained in 785 patients treated by defocalization. Of 468 persons with arthritis for less than six months the teeth of 366 were removed and 150 of these were improved, the tonsils of 78 were removed and 39 were improved, and of the 24 patients who had sinus surgery 3 improved. Of the 317 remaining patients with arthritis for more than two years 43 of 215 were improved following the removal of teeth, 21 of 84 after tonsillectomies and 1 of 18 after their sinuses were drained. These figures indicate the advantage of early focal surgery. The removal of foci in the early cases was approximately twice as effective as in the late stages of the disease. Some of the reasons which may be responsible for the failure of focal surgery are: 1. Not every infected tooth or tonsil is the cause of the focal infection. 2. Secondary foci may be present if the focal infection is of long duration. Thus even if the primary focus is removed infection may still be present in inaccessible areas. Remembering the frequency of secondary foci of infection the surgeon should, if possible, prepare a vaccine from the enucleated focus. 3. Not infrequently the infected focus is incompletely removed and focal infection continues. When teeth or tonsils are removed, fragments and surrounding infected areas may be left. 4. If the removal of infected foci is postponed too long it can scarcely be expected to effect improvement in terminal stages of the disease. 5. Surgery may activate a walled-off focus, and such incidental trauma may promote the development of secondary foci. The spectacular instances of recovery after focal surgery may blind one to the fact that not all patients are benefited and that some are even harmed. It is not fully realized that trauma to an infected focus may result in dissemination of its bacterial products. Even irritation of a focus may cause a systemic invasion. Bacteremia is often seen after defocalization. Septicemia and subacute bacterial endocarditis occur too frequently to be dis-

regarded. Subacute bacterial endocarditis after defocalization in patients with a history of rheumatic heart disease must always be kept in mind. In spite of such complications the author still believes that except in cases of rheumatic heart disease foci should be removed as early as is compatible with safety. In chronic infectious arthritis surgery should always be delayed in leukopenia, pronounced shift to the left of leukocytes, absence of blood complement and in an acutely infected focus. A short course of streptococcus vaccine reduces the incidence of exacerbations after defocalization. The statement that streptococcus vaccine has failed in the treatment of chronic infectious arthritis should not be accepted before some of the reasons for failure are analyzed. 1. Vaccines are often prepared from noninfecting or nonetiologic foci. 2. The autogenous vaccine prepared often consists only of the predominant strain, and such a strain may be nonpathogenic. 3. Stock streptococcus vaccines have often been employed. Most bacteriologists agree that stock vaccines are no better than non-specific therapy. 4. Vaccine therapy is sometimes begun too late in the stage of the arthritis when the symptoms are not due to infection but to articular derangement. 5. Dependence should not be placed on vaccine therapy alone: orthopedics, physical therapy, massage and corrective exercises are indicated. 6. Vaccine therapy is often discontinued too soon. 7. Improper dosage is often responsible for poor results. Experience has shown that small doses are effective. The author has used streptococcus vaccine for chronic arthritis for the last sixteen years. It should not be used to the exclusion of other recognized measures, but he feels that even if vaccine therapy does not cure arthritis it at least checks the infection. However, unless infected foci are removed reinfection will frequently occur.

Oleothorax.—Browning and his associates review 101 consecutive cases of oleothorax instituted at Sunny Acres Sanatorium for disinfection (tuberculous empyema) or inhibition (obliterative pleurisy) purposes between December 1931 and July 1939. Since the induction of oleothorax the patients have been cared for in sanatoriums, outpatient clinics or by private physicians. Recent reports on their condition and work capacity have been obtained from all but 11 patients; 9 died and 2 could not be located. In the 48 empyema cases oleothorax was never induced when the patient was acutely ill or toxicemic, and all but 1 had reached a relatively afebrile stage before the instillation of oil was begun. All persons studied had had oleothorax for at least six months, and the longest period of treatment was more than eighty-four months. Success was attained within a period of twelve months in 36 (75 per cent) of the 48 patients; the result in the remaining 12 patients was considered a failure because of persistent purulent fluid. In addition to the surprisingly prompt cessation of fluid formation in many cases, improvement in the patients' general condition was a prominent feature. In the successful cases, low grade fevers disappeared, malaise was less, appetites improved and weight gains were common. Of the original successes 33

patients still had a satisfactory oleothorax result at the time of this study. The work capacity of 18 of these patients* is either full or part time. Among the 53 patients with obliterated pleurisy 44 had had gross, serous effusion during pneumothorax therapy and 24 were still forming fluid when oleothorax was induced. As in the empyema group, all the patients had been treated with oleothorax for at least six months when the study was made. The treatment was successful in 46 of the group during the first six months and in 1 at eighteen months. Of the failures, 3 formed purulent fluid persistently, bronchopleural fistula developed in 2 and a pleurocutaneous fistula in 1. At the end of the study complications developed in 5; therefore the final tabulation shows 42 successes. The average duration of oleothorax in the successful group was thirty months, and 15 of these patients are doing full time work. Seven of these 15 have had oleothorax for more than five years. Ten patients are able to work part time, 11 are unable to work, 3 are still under treatment, 2 are dead and 1 could not be traced. A further study of the 26 patients in whom oleothorax was not successful shows that there is a definite correlation between positive sputum and the results of oleothorax treatment. In only 7 of 15 with a positive sputum was oleothorax successful as contrasted with 67 of 85 patients with negative sputums. An additional group of 21 patients with extrapleural pneumothorax had oleothorax for from five to fifteen months, with an average of ten and one half months. Serous or purulent fluid was forming in 13 when oleothorax was started. After one month, fluid formation had stopped in all but 4, and at the time of the study pus continued to form in only 1 after fourteen months of oil blockade. The results are satisfactory in 17 of the 21 patients, 1 patient died from other causes although oleothorax was successful, the lung of 1 reexpanded and the pocket was lost, a bronchopleural fistula developed in 1 after one month and a thoracoplasty is being done, and 1 patient had a persistent cavity because of insufficient collapse and left the hospital without approval after three months of oleothorax.

Tuberculosis of Tonsils.—Rosencrantz and Hurwitz determined the frequency of positive gastric contents associated with tuberculous tonsils. The material for their study consists of 103 female children from 8 months to 13 years of age admitted to the University of California Tuberculosis Service during the last five years. In each case the Mantoux test with 0.1 mg. of old tuberculin was positive. The gastric contents of each child were injected into a guinea pig. A roentgenogram was taken of each child. Many patients had hypertrophic tonsillitis and, when the general condition improved, tonsillectomy and adenectomy were done as indicated. The adenotonsillar tissue was studied microscopically. The pathologic lesions were either unilateral or bilateral and the tubercle formation was either discrete or confluent. Giant cell formation was common, but caseation was not a special feature. The surface epithelium of the tonsil was invariably intact. Tubercle bacilli were rarely demonstrated. In one case the adenoid tissue alone showed tuberculous involvement. There were 19 patients with tuberculosis of the tonsils. Their ages ranged from 16 months to 12 years. Clinical pulmonary tuberculosis was diagnosed in 8 patients and corroborated by roentgen study; hilar lymph node enlargement occurred in 9 patients and pleural effusion in 2. Cervical lymphadenitis was associated twice with hilar nodes, and in 1 of the latter patients an additional complication was bone tuberculosis. Of the 19 patients with tuberculous tonsils 18 had positive gastric contents as shown by guinea pig inoculation. The recovery following tonsillectomy was normal in every instance. The operation was deferred until the pulmonary lesion was quiescent and until the physical condition of the patient was generally improved. The tuberculous lesion in the tonsils was latent, and the indications for tonsillectomy were the same as in the nontuberculous child. The authors believe that removal of tuberculous tonsils will reduce absorption from tuberculous foci and perhaps offer a prophylactic measure against the development of tuberculous cervical adenitis. They suggest that children who harbor the organisms in the stomach have unconsciously coughed up and then swallowed the sputum. The mechanism of tonsillar infection remains unproved, in agreement with Long and his co-workers that probably all patients with pulmonary tuberculosis have tuberculous tonsils.

Hemolytic Streptococcus Pneumonia and Empyema.—Keefer and his associates analyzed 55 cases of hemolytic streptococcus pneumonia (39) and empyema (16) with regard to prognosis and treatment. Fourteen of the empyema cases followed pulmonary infection. The cases of pneumonia were primary, followed respiratory infection or were superimposed on a preexisting chronic pulmonary infection. The fatality rate in the 39 cases of pneumonia was 17 per cent. The unfavorable prognostic factors were age (i. e. more than 50 years of age), bacteremia and debilitating disease. The fatality rate for the patients with empyema was 18 per cent; there was only 1 death from empyema between the ages of 10 and 40 years. Bacteremia was present in 12 per cent of cases and it was more common in patients more than 50 years of age. The fatality rate in bacteremic cases was 57 per cent, whereas in the nonbacteremic cases it was only 7 per cent. Sulfanilamide or sulfapyridine did not reduce the incidence of empyema nor did it seem to shorten the course of the disease. There was suggestive evidence that the fatality rate among both the pneumonia and the empyema cases was reduced by using these drugs. Four patients with empyema recovered following multiple aspirations of the chest and chemotherapy. The best results were obtained with chemotherapy and thoracotomy.

Intravenous Sulfapyridine Sodium for Lobar Pneumonia.—Strickler and his co-workers report on the use of sodium sulfapyridine monohydrate intravenously in the treatment of 54 patients with lobar pneumonia. These patients were admitted to the Grady Memorial Hospital between Dec. 15, 1939 and March 16, 1940. The diagnosis was made from history, physical signs, laboratory studies, serial roentgenograms and postmortem observations. The routine dose of sulfapyridine sodium was 0.06 Gm. per kilogram of body weight repeated every six hours until the temperature became normal. The drug was dissolved in 750 cc. of physiologic solution of sodium chloride or in 5 per cent dextrose solution. The saline solution was used when vomiting occurred, otherwise dextrose solution was used. After the temperature dropped to normal, the same dose was given every eight hours for forty-eight hours and then every twelve hours for forty-eight hours, when the intravenous administration was discontinued and 1 or 0.5 Gm. of sulfapyridine was given orally every four hours. An equal amount of sodium bicarbonate was given by mouth with each dose of the two drugs. If the patient's response seemed unsatisfactory forty-eight hours after parenteral treatment was begun, type specific antiserum was administered. Thirty-two of the 54 patients were males and 22 females. Their ages varied from 13 to 84 years. The average age was 38 years, of the survivors 34 years and of the patients who died 64 years. The average number of days elapsing between the onset of the pneumonia and admission to the hospital was two and eighty-four one hundredths days, for the survivors two and eighty-two one hundredths days, and for the patients who died three days. There were 8 deaths, or a 14.8 per cent mortality. Of the 54 patients, 6 had a normal temperature within twenty-four hours

after the drug was first administered, 16 were afebrile within thirty-six hours, 10 within forty-eight hours and 5 within seventy-two hours. Of the 46 patients who recovered, 9 required more than seventy-two hours to reach the afebrile state. There was a spread of the pneumonic process in 1 of the patients who died and in 2 survivors. In the first the spread occurred after the drug had been discontinued because of tonic and clonic convulsions. The initial response of the infection was typical with crisis. Death was considered to be due to the toxic reaction from the drug. The first surviving patient had had an initial crisis within thirty-six hours and had been receiving 1 Gm. of sulfapyridine by mouth every four hours for six days. On the eleventh hospital day, while the free sulfapyridine in the blood was 3.3 mg. per hundred cubic centimeters, the pneumonia spread. Sulfapyridine sodium was again injected, but this time the response was by lysis. The other surviving patient was apparently well when sulfapyridine sodium was stopped on the tenth hospital day. The free sulfapyridine content was 2.6 mg. per hundred cubic centimeters of blood before the last injection. Sulfapyridine orally was begun with 0.5 Gm. every four hours. The next day the blood level of free sulfapyridine was too low to read. Pain over the contralateral lung, fever and signs of consolidation developed. Sulfapyridine was increased to 1 Gm. every four hours and the patient recovered by lysis. The drug of 11 surviving patients was discontinued because of hematuria, encephalopathy, rash or hemolytic anemia. Of these 6 recovered without further chemotherapy or specific antiserum. The other 5 were given type specific antiserum the day the drug was stopped or the following day. Antiserum was given to 3 patients while the drug was being continued: to 1 because of a very poor prognosis and to 2 because of leukopenia. The remaining 4 of the 12 patients who received antiserum were among the fatal group. The mortality rate of 14.8 per cent is not lower than that after oral administration of sulfapyridine. Complications of lobar pneumonia were not prevented by the intravenous administration of sulfapyridine sodium, and the toxic reactions were of about the same or of slightly greater frequency than those of patients receiving the drug orally.

Amphetamine Sulfate-Sodium Amytal for Schizophrenia.—Davidoff and his associates treated 80 patients with catatonic, paranoid, hebephrenic or simple schizophrenia with sodium amytal and amphetamine sulfate. They compare the results of this therapy with that obtained in 500 patients with schizophrenia treated by other routine procedures, 50 patients with dementia praecox treated with sodium amytal alone, 30 patients with dementia praecox treated with amphetamine sulfate alone and 25 patients with manic-depressive psychosis treated by the combined amphetamine-amytal method. Of the 80 patients 29 were discharged to their homes. The psychosis of 51 was of less than two years' duration and 22 of these were discharged. In the remaining 29 the psychosis was of more than two years' duration and of these only 7 were

returned to their homes. The most favorable results were obtained in the group with early catatonia, in which 15 of the 27 patients were discharged. In the group with more prolonged catatonia, improvement was observed in only 1 of 6 patients. Poor results were obtained in the paranoid and the hebephrenic group irrespective of the duration of the disease. Regardless of the length of the psychosis 5 of the 10 patients with simple dementia praecox reacted favorably. Of the 500 schizophrenic patients admitted consecutively from 1931 to 1936 and treated by routine methods only 20.6 per cent were discharged to their homes, as compared with 36 per cent of patients treated with amphetamine and amytal, and likewise 26 per cent of the control patients ill less than two years and 14 per cent ill more than two years as compared with 43 and 24 per cent, respectively, of those receiving combined therapy. The greatest difference was shown among patients with the catatonic type of disorder of less than two years' duration, the percentages being 23 for the control patients and 56 for those receiving the amphetamine-amytal treatment. Of the 50 patients treated with amytal narcosis alone, only 30 per cent were discharged to their homes. Twelve, or 40 per cent, of the 30 catatonic patients receiving amphetamine sulfate therapy alone were discharged to their homes, and of the 25 manic-depressive patients receiving amphetamine sulfate-sodium amytal therapy 13 were returned to their homes.

Convulsive Seizures in Delirium Tremens.—Among 305 active cases of delirium tremens there were, according to Rosenbaum and his co-workers, 29 who had convulsions. Except for the convulsion the clinical picture of these patients on admission was similar to that of the patients who had no convulsions. All 29 patients recovered. All but 1 had a history of many years of alcoholism before the onset of convulsions. The average age at onset was 39 years. There was a history of injury to the head in 34 per cent as compared with that of 8 per cent in those with no convulsions. Air encephalograms were made of 7 patients, and evidence of cortical atrophy and ventricular dilatation was obtained in all of them. None of the 29 patients had syphilis of the central nervous system or focal neurologic disease. Successive electroencephalographic tracings of 1 patient after ingestion of whisky revealed abnormal waves which became progressively exaggerated and spread to all parts of the cerebral cortex. However, no convulsions resulted. The finding that 9 per cent of the 305 patients with delirium tremens have convulsions coincides with the statement by Lennox and his associates that 10 per cent of the population has a cerebral dysrhythmia which may represent a predisposition to convulsions. The authors suggest that the following factors may cause convulsions to appear in delirium tremens: (1) a constitutional predisposition to fits, (2) cerebral lesions (injury to the head and alcoholic damage to the brain), (3) acute cerebral lesions and severe metabolic strains resulting from delirium tremens and (4) the exaggerating effect of alcohol on existing abnormalities in the brain waves.

Epidermophytosis Treated with Sodium Borate.—Ingels used sodium borate in powder form and soaks for the treatment of 202 cases of epidermophytosis of the feet, groins, axilla, anus and body. The powder was made up with 20 per cent aluminum silicate (kaolin) and 10 per cent magnesium carbonate for hygroscopic effect and also in a talcum base.

The soaks were administered in the form of 2 per cent foot or sitz baths. In a few cases of epidermophytosis of the trunk, sodium borate was used in an average of 1 cup to a tubful of water, with soaks once a day for ten minutes. The time for cure varied with the various sites, depending on moisture, friction and other mechanical factors. The dry, scaly type with the vesicular element responded best. Of the 202 patients with the typical dry or average vesicular involvement 138 were believed cured after an average healing time of seventeen days for those with uncomplicated foot involvement; 64 patients were greatly improved when last seen but did not return for a check-up. The average healing time for the groin, anal region and axilla were much longer. None of the patients showed dermatitis venenata, and no irritation was encountered. Generally the patients stated a beneficial effect on their itching symptoms. The raw, weeping and denuded type has not been included in the series. In such cases the method should be applied with extreme caution and only by an experienced dermatologist.

Allergy, Heredity and Age of Onset.—Ratner and his colleagues determined the presence or absence of a hereditary taint in 250 allergic children from 1 to 10 years of age. The period of maximal liability was the first five years of life. In the first year there was a slightly greater number (56 per cent) of cases occurring in the group with a taint on both sides (bilateral), and the group with no hereditary taint (negative) was slightly larger (48 per cent) than the group with a one-sided taint (46 per cent), that is the unilateral group. In the 2 to 5 year group the preponderance occurred in the unilateral and negative groups, and the bilateral group showed the smallest number. Between the sixth and eighth years the bilateral and the negative groups were both larger than the unilateral group. Therefore no evidence of a hereditary influence was seen among this group of children. It appears that, when children alone are the subject of a study, the absence or presence of allergy in other members of the family appears to have little influence on the age at which allergic symptoms manifest themselves. The preponderance of hay fever cases in data pertaining to adults has led to the impression that in patients with negative histories the onset is at a later age. Actually the onset of hay fever is later, and such patients present a lower incidence of positive family histories. Other clinical forms may also occur at any period, but from their data the authors find that eczema occurs earliest; the average age of onset of asthma and urticaria is intermediate. Persons with

an onset after puberty are usually hay fever sufferers. The difference in the age at which allergic syndromes ensue is more likely caused by variations in the type of the allergen and allergic syndrome rather than by genetic differences.

Diagnosis and Management of Cancer of Breast.—

Christie gives the following six points as guide to a course to be pursued in the treatment of mammary cancer: 1. A considerable percentage can be added to the five year survivals by a careful combination of radiation therapy with surgery. 2. Conservatism in the choice of patients for operation will reduce the total mortality. This will be accomplished by inducing women to come for operation earlier because of the greater percentage of cures among those operated on and because a less mutilating type of operation will be necessary. 3. Much can be accomplished by radiation therapy and minor surgical procedures in many cases which by properly revised standards should be considered inoperable. Such measures will add to the five year survivals, especially among elderly patients. 4. Roentgen castration should be a routine procedure in all women who have cancer of the breast and who have not passed the menopause. Pregnancy under such circumstances is especially dangerous. 5. The general management of the cancer patient requires the full cooperation of the general practitioner, the surgeon and the roentgenologist. 6. The 20 to 25 per cent of cures effected in cancer of the breast by radical operation can undoubtedly be improved if more patients can be induced to report as soon as anything abnormal is discovered in the breast. This will be greatly facilitated by more careful selection of cases for operation so that a much larger percentage of women will report themselves cured to their friends instead of exhibiting the results of an unsuccessful operation. Preoperative roentgen irradiation will probably improve the operative results by at least 10 and possibly 20 per cent. Also irradiation can assure a prolonged comfortable life to those whose disease is too advanced for surgery. An appreciable number of such patients may be clinically cured.

Prevention of Gas Gangrene Infections.—Hawking determined the effect of sulfonamide compounds and antisera on the prevention of gas gangrene in experimental wounds. The wounds were made in guinea pigs, one of the compounds was applied, a massive inoculation of *Clostridium welchii*, *Clostridium septicum* or *Clostridium oedematiens* was introduced, the wound was closed and the efficiency of the treatment determined by the survival or death of the animal. Most control untreated animals died in twenty-four hours and showed the typical infection. Smears from the wounds of treated animals on the third day invariably revealed many clostridia. Macroscopic observation after the insertion of sulfanilamide, sulfapyridine or sulfathiazole in solid form subcutaneously or intraperitoneally revealed no signs of local inflammation. Microscopically a diffuse infiltration with polymorphonuclears and monocytes was found, but this was no larger than would occur with any foreign body. Sodium sulfapyridine, however, was very irritant, being strongly alkaline. Sulfathiazole was distinctly more active against *Cl. welchii* than sulfapyridine, while sulfanilamide occupied an intermediate position. The total survivals of all experiments with the four substances were: controls 0/18, sulfapyridine 5/18, sulfanilamide 8/18, sulfathiazole 10/18 and the mixture of two parts of sulfanilamide and one part of sulfathiazole 13/18. Sulfathiazole was the most potent compound against *Cl. septicum* (survivals 75 per cent); sulfapyridine was inferior (38 per cent), sulfanilamide had practically no action (0 per cent) and the effect of the "mixture" was 41 per cent. The survival of animals infected with *Cl. oedematiens* after sulfanilamide and sulfathiazole was somewhat more numerous than that among the controls, but not significantly so. Life was often prolonged, the differences between the "guinea pig-day indexes" being just great enough to be statistically significant (probability, 1:20). In order to ascertain that survival was due to the specific action of the sulfonamide compounds, comparisons were made with sodium chloride, calcium carbonate and urea. Calcium carbonate or urea had no power to prevent infection, while sodium chloride favored its development. Comparison with other antibacterial compounds (benzyl sulfanilamide derivative and prontosil soluble) showed them to possess little or no activity. The survivals after *p*-benzyl-aminobenzene sulfonamide and prontosil rubrum were similar to those after sulfathiazole; but the clinical condition of the wounds was definitely worse. Nitrobenzene-sulfonamide was no better than sulfathiazole. Proflavine applied in strong concentration will certainly prevent infection of a wound by anaerobes subsequently inserted. On being reopened on the third day the wounds showed fairly healthy tissues and only a few bacilli. Nevertheless the mediocre results obtained with acridine compounds in the last war indicate that the value of proflavine is probably limited. Local treatment saved 58 per cent of animals infected with *Cl. welchii* and *Cl. septicum*; systemic (intraperitoneal) treatment, even if given two hours previously, saved only 23 per cent. The effect of delaying local treatment was studied with *Cl. welchii* and with *Cl. septicum*. When treatment was immediate, 20 of 30 animals survived; when delayed two hours, 3 of 15 animals survived and when delayed six hours none of 6 animals survived. None of the 30 controls survived. In the treatment of animals with antisera the wounds were made according to the standard technic and the serum was injected intraperitoneally before or after the operation. On the third day the wound was reopened to remove the cloth, and the dose of antiserum was repeated.

Two experiments were performed, the first with concentrated monovalent serums against the three clostridia and the second imitating the conditions in a casualty department where antitoxin is given prophylactically against an unknown infection. For this a commercial polyvalent serum containing *Cl. welchii*, *Cl. septicum* and *Cl. oedematiens* antitoxins was injected intraperitoneally at operation or at various subsequent periods. Monovalent serums specific for *Cl. welchii*, *Cl. septicum* or *Cl. oedematiens* protected the guinea pigs against the respective organisms. The polyvalent serum gave protection against most strains of *Cl. welchii* and *Cl. oedematiens* but not against *Cl. septicum*. The transference of these results to human cases is not quite legitimate, but they do suggest that treatment along these lines would be beneficial to casualties. The treatment is innocuous and nonirritant. A number of air raid casualties and street accidents have received such treatment at adjacent hospitals, and the results have been extremely satisfactory, even in wounds with heavy initial contamination. So far as gas gangrene is concerned the treatment is chiefly prophylactic; and it is a supplement to proper surgical measures and not a substitute for them. Since serum and drug supplement each other, the ideal procedure for general use should include both.

Chemotherapy of Gas Gangrene.—McIntosh and Selbie obtained a virulent culture of *Clostridium welchii* which produced a 100 per cent mortality in mice within twenty-four hours after its intramuscular injection. They found that 20 mg. of sulfanilamide given locally delayed death considerably after subcutaneous injection of cultures of *Cl. welchii*. When the local dose was increased to 40 mg. the average time of survival was greatly increased. Comparison of the effects of the local administration of 40 mg. of sulfanilamide and 50 mg. by mouth within six hours shows that all mice treated locally (by injecting the drug suspended in the infecting inoculum) survived for three days, whereas those given sulfanilamide by mouth had an average survival of only one day. Combined local and oral treatment revealed that when an adequate amount is given locally there is no great advantage in giving more by mouth. As with sulfanilamide against *Cl. welchii*, local administration of any of the three sulfonamides (sulfanilamide, sulfathiazole and sulfapyridine) in all three causal organisms (*Cl. welchii*, *septicum* and *oedematiens*) is more effective than oral treatment and there is no apparent advantage in supplementing local by oral treatment. All three drugs are of some value in delaying death, but sulfapyridine is of slightly greater value than sulfanilamide against *Cl. welchii* and *Cl. oedematiens*, and sulfathiazole is significantly more effective than the other two drugs against *Cl. septicum* and *Cl. oedematiens*. Local treatment becomes less effective if its administration is delayed; therefore the sulfonamide drugs, if they are to be of considerable value in the treatment of gas gangrene, should be administered at the site of infection in large quantities and as soon as possible.

*Incidence and Importance of Intestinal Parasitism in Early Infancy: Its Place in Preventive Medicine. F. Coutelen.—p. 29.

Intestinal Parasites in Preschool Children.—Coutelen conducted systematic stool tests for three years on 649 healthy nursery school children aged from 2 to 6 years, of agricultural, factory and mining workers, living in and around Lille and Douai, in order to determine the incidence and variety of parasitic infection in normal persons. Altogether 1,847 fecal tests were completed, covering fifteen schools. The procedure included at least three completed anal analyses for each child and various additional concentration technics (method outlined). Of the 649 children, 448 (69.02 per cent) were found to be parasitized. Multiple infection was found in 233 (56.69 per cent), as many as six varieties sharing the human host. Protozoa were discovered in 286 children (63.83 per cent), helminths in 273 (60.93 per cent). *Giardia lamblia* (in 195 children) and *Endamoeba coli* (in 160) accounted for most of the protozoic infection. The helminths were represented by *Trichocephalus trichiura* in 170 children, by *Oxyuris vermicularis* in 129, by *Ascaris lumbricoides* in 58 and by *Blastocystis hominis* in 155 children. Sex played no part except for pinworm infection. The incidence here in girls was almost twice that of boys (22.51 per cent against 11.45 per cent in Lille, 21.52 per cent against 12.71 per cent in Douai). Age seems to have only an inconsiderable effect on the incidence of infection. Fewer cases of parasitism (43.33 per cent) were observed among children of agricultural workers. Familial incidence was significant, *Giardia* occurring in 54 per cent of the children, *Endamoeba coli* in 58.33 per cent; oxyuriasis led with 87 per cent in the children of twenty-four families examined in Lille. The average index rising to 92.15 per cent. *Taenia saginata*, *Ancylostoma duodenale* ("Old World" hookworm), *Endamoeba histolytica*, *Strongyloides stercoralis* and *Hymenolepis nana* were not encountered. The author regards systematic and thorough fecal analyses of presumably healthy persons as valuable prophylactically and, when applied to sections of the population, as possessing epidemiologic significance. The possibility of latent intestinal parasitism in very young children needs to be kept in mind in general practice as well as in family and institutional involvements.

*The Meinicke Flocculation Test in Legal Medicine. F. Naville and R. Hermann.—p. 74.

Meinicke's Flocculation Test in Legal Medicine.—Naville and Hermann stress the value of the Meinicke flocculation test for syphilis, in cases of sudden death, to determine the actual pathogenic picture and as an aid in assuring purity of cadaver blood before transfusion. The results of flocculation tests made on 50 cadavers were found to be in harmony with the anatomopathologic conditions. Experiments on living subjects indicated that the Meinicke test remained positive a longer time in the blood than the Bordet-Wassermann reaction. The Meinicke test was never negative when the Bordet-Wassermann was positive, but the Meinicke test might run the whole gamut from slight to intensive positive reaction when the Bordet-Wassermann was negative. The same relations were found for cadaver blood. Hence the two tests are needed in combination for transfusions to eliminate the danger of blood infection. The differences observed by other investigators in the Bordet-Wassermann reaction are attributable to the diversity of technical conditions encountered in the withdrawal of cadaver blood. Two cases of sudden death selected from several reported by the authors demonstrate the etiologic value of the Meinicke test. A workman aged 44, the father of two healthy children, fell dead on the street on his

way to work. He was never known to have been ill. The Meinicke test was slightly positive. At necropsy serious syphilitic lesions were found in the myocardium, coronary arteries and the aorta. A 33 year old well mother of a single healthy child was suddenly seized with a severe headache, a condition to which she was not previously subject. After two epileptic convulsions with coma she died, eight hours after the onset of the headache. The test was positive. The necropsy revealed an aneurysm in the sylvian artery, is simple and requires no extensive equipment (procedure given). Blood is usually obtainable in sufficient quantities by subclavicular puncture but must be withdrawn as early as possible, not later than thirty-six hours after death, and be promptly placed in cold storage.

“March” Fractures.—Wilhelm discusses the pathogenesis of spontaneous metatarsal and pelvic fractures observed with relative frequency in the Polish campaign and seen under the stress of military drill and forced marches in young healthy recruits usually of asthenic build and physically unconditioned because of a life devoid of sports activities. There is no history of trauma, infection or neoplasm, nor are the patients conscious of a sudden pain at the time of onset. They continue their military tasks under difficulties until pain and edema call a halt. On roentgen examination a true fracture with fissure and callus formation is seen. Healing proceeds as in bone fractures caused by a trauma. Three case histories are selected by the author and related to the literature on the subject. In 1 case the lesion persisted with no callus formation even after six weeks of rest and foot immobilization. Metatarsal fractures call for prolonged rather than abbreviated rest. Multiple vitamin deficiency (A, C and D) may be involved. Pain of obscure origin in the metatarsus or pelvis after sustained walking or marching needs to be promptly examined roentgenologically. The value of sports, including barefoot walking, in building the musculature and ligamentous structure of the feet, cannot be overestimated.

Effect of Sulfonamide Drugs on Air Craft Pilots.—Meister and Hestermann investigated the problems of whether the sulfonamides, by inducing marked methemoglobinemia, can reduce tolerance to high altitude in fliers and lower their efficiency under conditions of curtailed oxygenation. The tests were conducted on 18 subjects, half of whom served for each test, after their normal performance under normal conditions had been determined. The first test was made in an under-pressure chamber after previous administration of paraacetylaminobenzenesulfanilid, 1 Gm. of which elicits a 20 per cent methemoglobin and induces cyanosis of the face, fingernails and lips. These 9 subjects were given from 1 to 1.5 Gm. three hours before the test. Cyanosis was plainly manifest. In the further altitudes were taken progressively at 1,000 meter advances at five minute intervals, while still higher altitudes were moderated to a 500 meter pace. In this test 6 of the 9 persons showed a tolerance reduction of only 500 meters, 3 none at all. In the second test the 9 subjects were treated for three days successively with several proprietary sulfonamides and set to inhale, under a gas mask, a mixture of oxygen and nitrogen (oxygen reduced to one third of normal levels) while writing numbers. Here the transition from the initial disturbances in writing was progressively followed to the point of the disrupt-

tion of the handwriting due to manifestations of tetany. Only 1 subject showed a reduced performance (by two minutes). He had shortly before the test contracted an infection associated with fever. Acute febrile processes are known to diminish tolerance to high altitude. The author concludes that no causal connection exists between methemoglobin formation due to the use of sulfonamide derivatives and impairment of flying efficiency.

*Secondary Contracted Kidney and Genuine Sclerosis in Children: Case. S. Künstler.—p. 92.

*Parenteral Effect of Vitamin D. F. Thoenes.—p. 120.

Secondary Contracted Kidney in Children.—Künstler discusses the criteria of differentiating secondary contracted kidney from true sclerosis, both of which are found in children, on the basis of a case and the literature. In a case of nephrosclerosis in a boy aged 12 years, necropsy disclosed glomerulotubular nephritis with secondary contractions and considerable arterial and arteriolar sclerosis. The clinical picture of secondary nephritis is characterized by the anemic and cachectic appearance of the patient, early and persistent renal dysfunction, early cardiac insufficiency and hypertension, which, however, does not attain the high levels found in true sclerosis of the kidney. There is a long period of latency. Death may supervene, as in this case, from apoplexy. Necropsy of children discloses significant changes in the glomeruli and tubules, which represent a combination of inflammatory and degenerative processes consisting in atrophy and hyalinization. The interstitial connective tissue is increased. Regenerative formations are seen in the uriniferous tubules. Of all cases of contracted kidney found in children, those of a secondary nature are the most frequent and attributable to renal involvement due to children's diseases. The frequency of nephrosclerosis in children is a question. Its latency may last from ten to twenty years. The author includes a discussion of the benign and malignant forms of this disease with clinical suggestions.

Parenteral Effect of Vitamins D₂ and D₃.—Thoenes reports the effect of vitamins D₂ and D₃, intramuscularly given, on 34 young children (29 nurslings, 5 of preschool age) affected with rickets in different stages of evolution. Of these, 22 were treated with vitamin D₂, the remainder with vitamin D₃, usually in doses of 15 and 10 mg. The progress of the investigation was controlled by roentgenograms taken at regular intervals and frequently by the analysis of the phosphorus-calcium levels of the serum. The site of the injection was irradiated immediately after each injection by means of a sollux lamp for twenty minutes. Most of the children were treated with vitamin D₂ during the winter season. All children suffered from more or less serious coexisting diseases such as spasmophilia, rhinopharyngitis, otitis media and chronic bronchitis. The results demonstrated that vitamins D₂ and D₃ elicit the same curative effects without distinction, though not with the promptness observed in oral medication (about one week's difference). Craniotabes, however, seemed to respond just as well to parenteral treatments. The delay in therapeutic response does not seem to be due to the fact that in parenteral dosing the participation of the liver is eliminated. Vitamins D₂ and D₃, employed intravenously by another investigator cited by the author, resulted in a more rapid rise of the phosphorus content.

*Internal Treatment of Cholelithiasis. H. Kutschera von Aichbergen.—p. 1053.

Sources of Error in Neurologic Tumor Diagnosis. E. Pichler.—p. 1055.

Internal Treatment of Cholelithiasis.—According to Kutschera von Aichbergen two different effects are aimed at in the treatment of cholelithiasis, depending on its stage: (1) control of the attack and (2) increased motility of the biliary system in an effort to expel the stones or to prevent their

formation. The treatment of biliary colic requires antispasmodic drugs. Not every biliary colic is caused by calculi. Colics may occur in cirrhosis of the liver, in gonorrheal disorders of the adnexa and in nervous, hyperexcitable young women. After a patient has passed through a severe biliary colic the nervous irritability must be reduced in order to decrease the predisposition to attacks. For this the author recommends mild antispasmodics and the application of warmth. Cholagogues and choleretics and foods that stimulate the flow of bile must be avoided during this period. Bile secretion cannot be permanently arrested, and, after the pains have subsided, efforts must be made to counteract the primary causes. These efforts have two aims: (1) removal of the existing gallstones and (2) prevention of the formation of new gallstones. The removal of gallstones is desirable if they cause pains; it is urgent in case of obstructive jaundice. If expulsion of the stones by potent choleretics and cholagogues proves impossible, surgical removal becomes necessary. The prophylaxis of new stone formation must be directed against the factors that bring on the formation of new gallstones. The author points out that every prolonged biliary stasis favors the development of concretions and stresses that, after a biliary attack has been arrested, choleretics and cholagogues must be given in order to stimulate the flow of bile. The pains involved in this hyperkinesis must be borne in order to effect adequate flushing of the biliary passages. The author evaluates different choleretics and suggests that infection plays an important part in the development of concretions. Medical therapy is effective only in the incipient stages of biliary infection; in the chronic infections surgical treatment is required. Dyscholia is another factor in the development of biliary calculi. This condition of the bile is the result of a hepatic disturbance, which in turn is brought on by gastrointestinal disturbances. For this reason the prophylactic treatment must first aim at a normal function of the gastrointestinal tract.

*The Impedin Phenomenon in Human Tumors. H. Joh.—p. 1.

Impedin Phenomenon in Human Tumors.—The discovery by several observers of the impedin energy inherent in neoplastic tissues has provided a new immunobiologic method of approach in the study of the etiology of human tumors. According to this theory, as formulated by Torikata (Die Impedinerscheinung, Jena, 1930), the impedin energy resides only in the microbiologic lipoprotein bodies; hence the presence of impedin energy which can be demonstrated in any given tumor tissue may be taken to constitute a provisional proof of the microbiologic origin of neoplastic growth. In order to obtain further evidence to test this hypothesis, Joh examined the impedin phenomena with 30 specimens of human tumors removed by operation. The filtrates from tumor tissues were prepared by grinding 1 Gm. of the fresh material with 5 cc. of physiologic solution of sodium chloride containing 0.5 per cent phenol, and the technic of opsonic index study as employed by Wright was followed, using suspensions of *Staphylococcus pyogenes aureus*. The suspension of leukocytes was prepared from a normal living guinea pig which had been injected intraperitoneally with 10 cc. of neutral meat juice; a small cannula inserted into the abdominal cavity allows a desired amount of leukocyte-laden peritoneal fluid to be withdrawn for the observation of phagocytosis. The examinations were repeated three times for each tumor filtrate and the average value was used to express the impedin action of the tissue. The positive impedin phenomena were observed with filtrates prepared from small and large round cell sarcomas, polymorphous cell sarcoma, spindle and giant cell sarcomas, osteogenic sarcoma, lymphosarcoma, melanosarcoma and other miscellaneous varieties of sarcoma; negative impedin phenomena were obtained with practically all types of epithelioma, fat and fibrous tumors, vascular tumors and tumors of the nervous system. From these observations the author concludes that the etiology of sarcomatous neoplasms is microbiologic in nature and that when microscopic examination gives uncertain results the impedin test may be employed to differentiate sarcomas from other types of neoplastic processes.

Book Notices

Born That Way. By Earl R. Carlson, M.D. Cloth. Price, \$1.75. Pp. 174. New York: John Day Company, 1941.

The author is a neurologist who has achieved great respect in his special work with spastic children. In this book he writes an autobiography full of interesting details concerning his own development from a helpless spastic-athetoid cripple to a position of distinction in the medical world. Woven into this story are lucid simple explanations of the neurologic, orthopedic and psychologic problems easily understandable by the layman. Parents reading this book cannot help but become inspired to greater yet rational hopes for their own offspring similarly afflicted. Among several recent accounts this work is by far the best and should be recommended strongly by physicians to parents of spastic children. For the neuropsychiatrist, especially interesting is the effect of concentration and attention in alleviating athetosis. Likewise increased oxygenation, moderate doses of alcohol and intellectual activity seem to decrease the disability. The reviewer suggests that neurologists and orthopedists can profit greatly by reading the book, even though it is written for the public, for then too will their therapeutic pessimism be largely overcome.

Diseases of the Nervous System Described for Practitioners and Students. By F. M. R. Walshe, O.B.E., M.D., D.Sc., Physician in charge of the Neurological Department, University College Hospital, London. Cloth. Price, \$4.50. Pp. 288, with 9 illustrations. Baltimore: William Wood & Company, 1940.

This is a primer in neurology. Whether such an elementary and superficial textbook on this subject is desirable and will prove useful to general practitioners and medical students is debatable. In any event the entire neurologic world cannot be other than disappointed that the editor of a leading neurologic journal and the most acrid critic among living neurologists should not have provided richer fare. As is to be expected from so eminent a neurologist, the limited information presented is, by and large, accurate; but there is no excuse for the numerous errors and bits of misinformation which the book contains. The statement on page 29 "that with cerebral disease incontinence . . . is not due to any special localization of the lesion" takes no cognizance of the excellent studies of Langworthy on the central innervation of the bladder which have been carried out for the past several years. In figure 1 the rubrospinal tract is shown as though it were a very important pathway, whereas in a man it is almost non-existent and there is no evidence that it plays a significant part in human neurophysiology. The illustration on page 33 which shows part of the fibers of the optic tract terminating in the pulvinar of the thalamus and the nervous impulses being thence relayed to the calcarine cortex is not in accord with the known facts concerning the visual system. The unqualified statement on page 50 that in association with increased intracranial pressure "the systemic blood pressure does not rise above normal" is by no means always true. The statement on page 51 that there "is sufficient evidence to make it reasonable to suppose that occasionally a head injury may act as an exciting factor in tumor development within the skull" is one of those loosely made suppositions unsupported by qualification or factual evidence which cause honest men much difficulty in the courts. On the same page the author states that the classification of gliomas is "largely arbitrary and of ephemeral value" and then proceeds to utilize the terminology usually applied to the three most common gliomas. The fact that he discusses only the more common types does not make the existence of the oligodendrogliomas or the ependymomas any the less real, their classification any more arbitrary or diminish the value of knowledge about them. There is no well controlled basis for the statement on page 51 that surgical intervention may serve to transform a benign into a malignant glioma; and the further statement that "Sooner or later all gliomas prove fatal" is simply not true. The same erroneous pessimistic prognostication appears on pages 60 and 61. The advice on page 55 that examination of the cerebrospinal fluid obtained by lumbar puncture be used in the differential diagnosis of cerebellar medulloblastomas is dangerous instruction to be placed in the

hands of the general practitioner and student and cannot be too severely condemned. The statement on page 55 that the protein content in the spinal fluid may be increased "up to 0.2 or 0.3 mgm. per 100 c.cms." is undoubtedly a typographic error. The "differential diagnosis" of vascular disorders of the brain on page 81 is confused and weak. The statement on pages 81 and 82 that high blood pressure usually accompanies atheroma of the cerebral arteries evidences an ignorance of observations at the necropsy table or a failure to correlate them with the clinical observations.

The remaining two hundred pages are similarly replete with errors and misstatements all of which cannot be detailed here, but in the event that this little book should prove popular it is to be hoped that they will be removed in subsequent editions.

There are practically no citations of relevant literature and no illustrations. This book is too elementary and the treatment of the subject matter is too misleadingly simplified to allow of its recommendation to students in American medical schools.

A History of Medicine. By Arturo Castiglioni, M.D., Research Associate in the History of Medicine at Yale University, New Haven. Translated from the Italian and edited by E. B. Krumbhaar, M.D., Ph.D. Cloth. Price, \$8.50. Pp. 1,013, with 443 illustrations. New York: Alfred A. Knopf, 1941.

This book is the first American edition of the author's volume in Italian, which was published in Milan in 1936. The translator, Dr. E. B. Krumbhaar, has added a new bibliography, many references and much modern information. The volume has made for itself a leading place in the literature of the history of medicine, having passed through three editions in Italian and having been translated previously into French, German and Spanish. This is much more than a textbook. Whereas many another history of medicine is simply a record of dates and events, this book is enhanced by interpretation and philosophical analysis of the trends in various periods. The illustrations constitute one of the most valuable contributions in the book. In the section on modern medicine the author has carefully analyzed progress in each of many fields and rightly mourns the degradation of scientific medicine in Germany. Professor Castiglioni recognizes the danger that the practice of medicine, if it becomes too scientific, may yet remove the doctor from the patient. Thus he says "The physician of today, better realizing the limitations of bacteriological and other technical aids, is experiencing the need of returning to the patient's bedside, from which medicine should never have separated itself. With the extreme swing of the pendulum too much faith has sometimes been placed on the pronouncements of the laboratory when, forgetting the importance of the clinical picture, physicians have based their activities too exclusively on laboratory criteria. For some years now physicians have tended through ignorance of the possibilities and limitations of laboratory methods either to place too much reliance on what came out of the four walls of the laboratory or not to take advantage of the information that it could properly give. They tended to pay more attention to the evidence of the microscope and of chemical reagents than to the information obtained by their own senses from examination of the patients in the wards of the hospitals. Today, with a better knowledge of these possibilities and limitations, they tend to scrutinize sagaciously the information received from both sources. Clinical instruction in the hippocratic sense fortunately never was completely neglected, and voices continued to maintain the necessity of returning to the classical paths, reinforced with the riches of newly acquired knowledge, but with the eye steadfastly fixed on the goal of the patient's welfare. All the marvelous discoveries of recent times cannot remove the physician from his post of honor in detecting morbid phenomena and following the mysterious rhythm of life and death: a post, that is, at the bedside of the patient."

Here is a new history of medicine in English which has an appeal not only for every physician but for every reader. The crowded condition of the curriculum makes it almost impossible for the average student to become aware of the tradition and inspiration that support the modern teaching and practice of medicine. He will do well to orient himself in his chosen field by a careful reading of Castiglioni's monumental work during the coming summer.

Debatable Tumours in Human and Animal Pathology. By W. F. Harvey, E. K. Dawson and J. R. M. Innes. Published for the Cancer Control Organisation of Edinburgh and South-East Scotland. Cloth. Price, 10s. 6d. Pp. 124, with illustrations. Edinburgh & London: Oliver & Boyd, 1940.

This book deals with nine tumors about whose origins and essential nature oncologists disagree. Each tumor is described and illustrated, and an opinion, which the authors admit is often dogmatic, is expressed on the debatable points. The bibliographies are incomplete but are "directional" and useful. The authors regard seminomas as arising from undifferentiated epithelium of the seminiferous tubules; the granulosa cell tumor as of primitive ovarian follicle cell origin; "mixed tumors" of the salivary glands as epithelial (adenoma and adenocarcinoma, regardless of morphology) and not bidermal; malignant melanomas as carcinomas—epidermal melanocarcinoma in the skin and neuroectodermal carcinoma in the eye—minimizing the neural theory; lymphoepitheliomas as either epidermoid or transitional cell carcinoma, or reticulum cell or lymphosarcoma; giant cell tumor of bone as a type of new growth intermediate between purely reactive tissue and blastoma; endothelioma as of mesodermic tissue origin and manifest as vasoformative or membranoformative and reuniting reticulo-endothelium and vascular endothelium; lymphosarcoma as arising from the embryonal, mesenchymal, stem cell of lymphoid tissue; meningiomas as arising from the mesodermic stem cells of the pachymeninx or leptomeninx which are of meningeal endothelium with membranoformative or vasoformative tendency. The authors revive and enlarge the Cohnheim concept, which they repeat often, that "... all tumors are developed out of those undifferentiated, embryonal cells which remain as such into adult life" (p. 3), ignoring the evidence derived from experimental cancerogenesis, and they ignore the somatic mutation theory. Using contributions of experimental embryologists, they reach some provocative conclusions. The chapter on endothelioma is especially good. This book demands the attention of all those who try to keep informed on these tumors.

Aneurysms of the Cerebral Vessels with a Study of Thirty-Two Cases Found at 12,503 Consecutive Necropsies. By Cullen Ward Irish, M.D., Sc.D. This Study is a Chapter from a Monograph, "Vascular Encephalopathy." Submitted as a Thesis to the Graduate School of the University of Pennsylvania as a Partial Requirement for the Doctorate Degree in Neurology. Paper. Pp. 61, with illustrations. Ann Arbor: Edwards Brothers, Inc., 1940.

This monograph contains an excellent review of the literature and bibliography on aneurysm of the cerebral vessels. The etiology, symptomatology and incidence of cerebral aneurysms are demonstrated by reports of cases. Reports of cases of aneurysms of the anterior, middle and posterior cerebral arteries, the anterior and posterior communicating arteries and the internal carotid and the basilar arteries collected from the literature are presented. The author then reports data on the thirty-two cerebral aneurysms found in the course of twelve thousand, five hundred and three necropsies. Charts and drawings of the anomalies observed about the circle of Willis are included. The cases are discussed at length, and cases to demonstrate the symptoms of aneurysms in certain regions are reported. The type is readable, the photographs are clear and the text is interesting. Lithoprint as used in this book has its advantages in monographs of this type.

Tumores dos nervos perifericos. Pelo Dr. Walter Edgard Maffei, assistente do Departamento de anatomia patológica da Faculdade de medicina da Universidade de São Paulo. Tese para Inscrição ao concurso de docência-livre da 2.ª cadeira, anatomia patológica (patologia geral e especial). Paper. Pp. 93, with 35 illustrations. São Paulo: São Paulo Editora Limitada Imprensa, 1940.

This monograph on peripheral nerve tumors has been presented in application for the chair of privatdozent in the pathologic department of the Medical School of São Paulo, Brazil, and constitutes the third of a series on tumors of the nervous system. In the two previous monographs the author treated the subjects of gliomas and meningiomas. The work is written in Portuguese. The author first explains the anatomic and histologic particularities of the peripheral nerves. He then briefly reviews the different concepts of the etiology of peripheral nerve tumors, from the pioneer work of Cheselden to the present time. The subject matter is arranged from the clinical point of view, and in successive chapters the author discusses

(i) traumatic neuroma, (ii) solitary tumors of the nerves, (iii) multiple tumors of the nerves, (iv) malignant tumors of the nerves and (v) multiple tumors of nerves (von Recklinghausen's disease). He considers the differentiation of the von Recklinghausen syndrome from other entities, particularly leprosy. The differential diagnosis from leprosy is emphasized as being of great clinical importance. The monograph is well written and presents the problem clearly. There are good photomicrographs and illustrations of patients with von Recklinghausen's disease.

A History of Contagious Disease Care in Chicago Before the Great Fire. By Constance Bell Webb, Social Service Department. Montreal General Hospital, Montreal. Paper. Price, \$1.25. Pp. 169. Chicago: University of Chicago Press, 1940.

This publication traces the progress of public health and health conditions in Chicago from the time this city comprised only an Indian agency, Fort Dearborn, Mr. Kinzie's Trading Post, a few huts of halfbreeds and the wigwams of the Pottawattamies, to the time of the great fire. In 1830 Chicago came into being and Fort Dearborn "disappeared." Three years before this time, in 1827, the state legislature passed a law providing for the punishment of any person rendering offensive or unwholesome, or obstructing or polluting any water course, lake, pond, marsh or common sewer. In July 1832 the first outbreak of cholera occurred when several companies of soldiers entered the fort. The author continues, in a well documented thesis, the history of health development in this early Middle Western settlement. One gains a good idea of the complexities and difficulties encountered by far sighted leaders in the struggle for healthful conditions in early Chicago. The text quotes in great detail from authentic sources the opinions, laws and resolutions passed and discussed by the town leaders. The Chicago Medical Society played a major part in the early health development of this city. However, since so little was known about cause and cure of disease, action often was late. This thesis probably will be of interest not only to the person interested in health development in Chicago but to persons interested in the early historical development and trend of medical thought during the nineteenth century.

Anus, Rectum, Sigmoid Colon: Diagnosis and Treatment. By Harry Ellicott Bacon, B.S., M.D., F.A.C.S., Clinical Professor of Proctology, Temple University School of Medicine, Philadelphia. Introduction by W. Wayne Babcock, A.M., M.D., LL.D., Professor of Surgery, Temple University School of Medicine. Foreword by J. P. Lockhart-Mummery, M.A., M.B., B.C. Second edition. Cloth. Price, \$8.50. Pp. 857, with 507 illustrations, mostly original, by William Brown McNett. Philadelphia, Montreal & London: J. B. Lippincott Company, 1941.

In this edition approximately twenty-five illustrations and fifty references have been added. There is a new comment on colostomy, another on sacral resection and a new paragraph on the use of neosynephrin hydrochloride. Murrieta's operation for rectal prolapse is new to this work, and the author's operation for hemorrhoids has been rewritten. These and a few other minor changes complete the alteration; hence no new criticism is required. As was stated in the review of the first edition, the book is interesting and instructive and will prove valuable as a work of reference.

Experimental Physiology. By George H. Bell, M.D., B.Sc., Mulhhead Lecturer in Physiology, University of Glasgow, Glasgow. Second edition. Boards. Price, 6s. Pp. 192, with illustrations. Glasgow: John Smith & Son, Ltd., 1940.

The new edition of this manual is, like the first, adapted primarily to the needs of the author's laboratory, although it has been enlarged by inclusion of experiments used in other laboratories. Many of these are devised for human subjects and as such represent a distinct improvement over the previous edition. The manual is greatly improved in minor details and can be readily adapted to any standard physiologic laboratory. While better than the average, it still has no especially distinctive features.

List of Respiratory Protective Devices Approved by the Bureau of Mines. By H. H. Schrenk. United States Department of the Interior, Bureau of Mines. Information Circular 7030R. Paper. Pp. 11, with illustrations. Pittsburgh, 1941.

This is the most recent revision of the list of approved respiratory protective apparatus issued by the Health and Safety Branch of the Bureau of Mines. Certificates of approval are issued only if the devices fulfil established requirements. These are discussed briefly in the circular.

Queries and Minor Notes

2825

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

TYPHOID AND TYPHOID CARRIERS

To the Editor:—Can you give me any information as to whether or not a person may be a carrier of typhoid bacilli for any length of time and yet may be susceptible to this organism and acquire the disease?

M.D., Buffalo.

ANSWER.—Although uncommon, it is theoretically possible for typhoid carriers to contract the disease, and there are such instances on record. The explanation lies in several factors, involving personal variations in immunity to the disease after recovery and certain other aspects of the carrier state.

Epidemiologic surveys have clearly demonstrated that susceptibility to a given dose of typhoid organisms varies widely from person to person. Further, in those who have recovered from the disease, immunity is also a relative matter, so that large or overwhelming doses of organisms have produced the disease in such people, irrespective of whether they are carriers or not.

So-called healthy carriers have either (a) never suffered from the disease or (b) have had typhoid in a mild or unrecognized form. Certain individuals, called incubation carriers, harbor and discharge organisms for varying lengths of time, in one reported instance one hundred and seventeen days, before coming down with the disease. The mechanism and localization of invasion and the course of the bacillus through the body in healthy carriers has been shown to be identical with that followed in actual clinical typhoid. Later these people may succumb to the bacilli and contract the disease as the result of "recovered" carriers than to either the "healthy" or the "incubation" carriers. In any case it is a relatively rare occurrence. Full discussion of this problem with references to original literature on the subject may be found in Gay, F. P.: Typhoid Fever (New York, Macmillan Company, 1918).

LACRIMATION AND TEAR GAS

To the Editor:—1. Where can small quantities of "tear gas," i. e. sufficient to cause lacrimation in one person, be obtained? 2. Would it be harmful to a person exposed to it once or twice a month? 3. What are its composition and properties? I want it for some experiments on myself.

Amy Weiss, M.D., Chicago.

ANSWER.—There are many chemical compounds which may cause lacrimation. The most common form of "tear gas," however, is chloracetophenone or mixtures containing this compound.

1. Small quantities may be obtained from commercial firms whose names can be secured from the local police station. Small quantities may also be made in a well equipped chemical laboratory.

2. There is no permanent danger from repeated exposures to the gas in the concentrations to which exposure usually occurs. Occasionally, workmen may suffer a dermatitis in the manufacture of chloracetophenone. There are no known allergic ocular reactions from repeated exposures. Occasionally, if the face is freshly shaven there may be some transient burning or even redness of the skin. With high concentrations, difficult to attain under ordinary circumstances, burns may occur.

3. Chloracetophenone is, chemically, phenylchloromethylketone, $C_6H_5COCH_2Cl$. The pure material is a powder having an odor of ripe fruit. The melting point is 59 C., and the boiling point is 247 C. The compound is resistant to heat and moisture and persists in the open air, in the summer for days and in the winter for weeks. Chloracetophenone is not destroyed by boiling. The compound is only slightly soluble in water but is readily soluble in the organic solvents. The odor is reported to be detectable when the compound is present in the amount of 0.0002 ounce (0.0056 Gm.) per thousand cubic feet of air; the concentration is intolerable at 0.34 ounce (9.4 Gm.) per thousand cubic feet of air for three minutes. Chloracetophenone is usually made from acetic acid, chlorine, sulfur monochloride and benzene in the presence of zinc chloride and anhydrous aluminum chloride as catalysts. Exposure causes severe blepharospasm and lacrimation, which passes off rapidly

on exposure to a current of fresh air. The tears do not irritate the face. Usually no treatment is necessary, but, if the eyes continue to feel irritated, boric acid solutions may be used. The eyes must not be rubbed. Curiously, animals show no lacrimation from exposure to the usual concentrations of chloracetophenone.

PROTECTION AGAINST DERMATITIS CAUSED BY ARSENITE AND CAUSTIC SODA SPRAY

To the Editor:—I have seen several men from ranches where the sodium arsenite is used who have had an eczematoid lesion which has involved the scrotum, the inner aspects of the thighs and the lower abdominal region. When these patients do not work with the sodium arsenite the lesion disappears, so that I feel certain that this substance is causing the cutaneous lesions. The men engaged in this work wear clothing consisting of long underwear, overalls, leather jackets and leather gloves. Any information which you can give which would further protect these men from the irritation caused by sodium arsenite would be appreciated.

M.D., Arizona.

ANSWER.—Dermatitis from arsenicals is not infrequent. Schwartz and Tulipan in "A Textbook of Occupational Diseases of the Skin," on page 305, state that ulcerations of the skin and of the nasal septum, as well as vesicular or vesicobullous dermatitis with crusting, localized on the lower part of the abdomen, groins and thighs occurs among workers handling arsenicals. On page 310 of the same work, arsenic trioxide and sodium arsenite are specifically listed as active irritants of the skin. It is well known that sodium hydroxide causes ulceration of the skin when in concentrated solution and dermatitis in more dilute solutions (Schwartz and Tulipan, p. 113).

The stock solution used for the eradication of mesquite consists of 8 pounds (3.6 Kg.) of arsenic trioxide powder and 2 pounds (0.9 Kg.) of caustic soda flakes dissolved in 3 quarts (liters) of water, forming a strongly alkaline, irritating and poisonous solution of sodium arsenite. Arsenic trioxide and caustic soda are themselves powerful cutaneous irritants and if they soil the clothes will cause dermatitis and ulceration of the skin in the presence of perspiration. The long underwear and the coveralls worn by the workers are conducive to perspiration, and the sites of heaviest perspiration, the groins and the belt line at the waist, are likely to show dermatitis from these powders penetrating the clothing. The finished stock solution when splashed on the clothes may soak through to the skin and cause dermatitis and ulcers. If it does not soak through to the skin and dries on the clothes, the perspiration coming through will redissolve the dried chemicals and thus allow them to come in contact with the skin and cause dermatitis and ulcers. The leather jacket and the leather gloves serve as better preventive clothing than the long underwear and coveralls because they are more impermeable.

The precautions to be observed by mixers of the stock solution, as published by the Southwestern Forest and Range Experiment Station, are as follows:

The "stock solution" should always be mixed in the open and within a larger container, such as a 10 gallon oil drum which has had one end removed. Especial care should be taken to avoid spattering of the materials on the skin or into the eyes. Gloves and eye glasses should always be worn by the worker. Avoid breathing any vapors which may arise from the hot liquid. The solution resulting is sodium arsenite, which is extremely poisonous if taken either externally or internally by animals or human beings.

These measures are not sufficient to prevent dermatitis. They should include the following additional precautions:

The stock solution should preferably be made under properly vented suction hoods. The mixer should wear rubber gauntlets, over which are buttoned sleeves of an impermeable material such as plovium, vinylite or koroal (Schwartz, Louis; Warren, L. H., and Goldman, F. H.: Clothing for Protection Against Occupational Skin Irritants, *Pub. Health Rep.* 55:1158 [June 28] 1940). Coveralls made of the same material should also be worn. The mixer should wear goggles in order to prevent the irritation from getting into the eyes and a respirator in order to prevent the breathing of the poisonous dusts. If such suction hoods are not available, or if the stock solution must be made in the field, then it should always be mixed in the open and in large containers and the mixer should stand to the windward of the mixing pot and wear goggles, respirators, rubber gloves and such impermeable clothing as described above.

The workers diluting the stock solution should be required to wear goggles, gloves and impermeable coveralls or impermeable sleeves, and long aprons instead of coveralls, and also to stand to the windward side of the mixing basin.

The workers pouring the arsenic solutions into the trenches or when using the girdling method should be required to wear rubber gloves and impermeable coveralls or impermeable sleeves and long aprons.

After the solution placed in the basins or on the mesquite dries, the dust in the region may be carried by the wind into the clothes of the men and cause dermatitis. The dry residue from vessels and tools, if in sufficient quantity, may also permeate

the clothing of the workers and cause dermatitis. It is advisable that all men working at this occupation should wear impermeable clothing. This would obviate the necessity of wearing special underclothing.

PHARMACOLOGY OF IPECAC

To the Editor:—Has there been any authoritative work done clinically or pharmacologically since 1937 on ipecac? If so, can you lead me to this or other information? What dose taken three times a day for an adult would be considered safe to be used for a period of two weeks? Would the dose of 1 grain (0.06 Gm.) as listed in the U. S. Pharmacopeia three times a day be satisfactory or should a greater or a lesser amount be given, depending on the pathologic condition as it existed, say, for example, acute bronchitis? Is ipecac in doses of 1 grain injurious if used three times a day for a period of ten to fourteen days? Has any one been seriously hurt by taking this quantity of ipecac for this length of time? Are there any records of death occurring from the use of this drug in the dose and the length of time expressed? Is there any information which shows the comparative toxicity of ipecac and emetine?

M. A. Hodgson, M.D., Memphis, Tenn.

ANSWER.—In none of the recent textbooks of therapeutics is there any stated limitation to the length of time ipecac may be used as an expectorant; indeed, the only limitation at all seems to be due to the nauseant property of the drug. Abroad the infusion of ipecac is much used, but in this country the syrup, which is generally considered to be more reliable, is almost universally employed; however, it should be noted that recently Weiss and Sprague (*Am. J. M. Sc.* 194:54 [July] 1937) have stated that they found considerable variation in the potency of various specimens of the syrup which they tested. Beckman (Treatment in General Practice, Philadelphia, W. B. Saunders Company, 1938, p. 24) said, in discussing the use of the syrup of ipecac as an expectorant, that the U. S. P. dose of 12 minims (0.74 cc.) is too large if the drug is to be repeated often (he considered that a dose every two hours is necessary for satisfactory expectorant action) and recommended a dose of 5 to 8 minims (0.3 to 0.5 cc.) in order to avoid nausea. Thus his total dose in a twenty-four hour period—giving the drug every two hours from 8 in the morning to 10 at night—would be approximately $4\frac{1}{2}$ grains (0.3 Gm.) of ipecac, since the official syrup contains 7 per cent; the U. S. P. dose would be slightly more than $6\frac{1}{2}$ grains (0.4 Gm.). Nowhere does one find stated a limit to the length of time over which such a dose may be administered with safety. Indeed there does not seem to be much reason to fear that toxic symptoms will follow the administration of even large doses of ipecac. For example, Andresen (*Am. J. Trop. Med.* 6:119 [March] 1926), in the treatment of amebic dysentery, introduced a Jutte tube well down into the duodenum and after thoroughly washing out the intestine introduced 1 drachm (4 Gm.) of powdered ipecac and repeated this regimen daily seven times and after a week's rest went through the entire treatment again. There were no reports of systemic toxicity accompanying this regimen.

In earlier times there were many speculations with regard to the numerous substances obtainable from ipecac by extraction, but the theories with regard to the expectorant action of the drug finally settled down to three: first, that emetine was alone responsible; second, that cephalin was solely responsible, and finally, when saponin also was found to be present, the claim was made that it was the only true expectorant ingredient. However, the matter seems recently to have been settled on an experimental basis by Rosenthaler and Gordonoff (*Schweiz. med. Wchnschr.* 18:450, 1937), who, using rabbits and a roentgenographic method, showed that both emetine and cephalin were active as expectorants and that saponin was able to increase the action of either of the other ingredients either singly or in combination, though alone it was not very effective. Thus it would seem that no advantage is to be expected from administering emetine instead of ipecac for expectorant purposes.

That emetine alone is highly toxic is of course well known, but this fact should not cause great toxicity to be ascribed to ipecac. Ipecac was used for a long time as an expectorant without any concern over systemic toxicity before the introduction of its active ingredient, emetine, in the treatment of amebic dysentery by Rogers in India in 1912. And it is to be pointed out further that this use of emetine is solely parental, necessarily so because its nauseant properties prevent the administration of sufficient quantities by mouth for effective amebicidal action. It would seem that the toxicity of emetine under these conditions is not at all to be related to the toxicity of the emetine which exists as an ingredient in the syrup of ipecac when used for expectorant purposes.

ANTIBODIES IN VACUUM-DRIED SERUMS

To the Editor:—I am unable to find much concerning lyophil antibody factors in the 1940 *Quarterly Cumulative Index Medicus*; there is some reference to dried plasma in relation to blood transfusion and to immune human serum but not about the immune serum or rather plasma in the solid dry form. I should like to get some information as to the fate of measles or scarlet fever antibodies for example, when they are dried and kept in the solid form under a partial vacuum.

Joseph H. Stickler, M.D., Baltimore.

ANSWER.—Vacuum-dried serums, that is, serums desiccated in vacuo from the frozen state by the lyophile, cryochem or desicav processes are definitely more stable than similar serums preserved in liquid form. Measles antibodies and scarlatina antibodies (excepting for antitoxin which is present in small amounts in human convalescent serum) cannot as yet be accurately titered, but those antibodies which can be accurately titered such as complement are shown to remain stable over long periods of time in the vacuum-dried state (up to three years or more) whereas under ordinary methods of storage in the liquid state there is a rapid deterioration with a loss of as much as 75 per cent in potency in a matter of days. It may be assumed that less labile antibodies than complement remain at their highest titer for even longer periods of time. The National Institute of Health has already allowed longer dating periods on vacuum-dried biologic preparations manufactured by certain commercial firms and human serum centers. Further information on this subject may be found in the references:

CULTURE MEDIUMS FOR GONOCOCCI

To the Editor:—Would you please send or give me references to the best culture mediums for the gonococcus and the methods or technic involved? The cultural method offered by the Difco Laboratories is expensive, and I would like to use the culture method more frequently if I could prepare the culture mediums here.

D. T. Prehn, M.D., New London, Conn.

ANSWER.—The most satisfactory medium for the cultivation of gonococci in a small laboratory is the desiccated one marketed by Difco Laboratories under the name Bacto-proteose No. 3 Agar. It should be enriched just before pouring by the addition of $\frac{1}{20}$ to $\frac{1}{40}$ volume of sterile defibrinated blood of horse, sheep or rabbit (in that order of preference) or sterile ascitic fluid or, if none of these are readily available, Bacto-hemoglobin.

Many workers advise heating the blood to a dark brown. To do this, the melted agar may be allowed to cool to 70 to 75 F., the blood added, mixed and maintained at that temperature about ten minutes or until it looks like chocolate; then poured into Petri dishes.

Gonococci grow best at a temperature about 1 degree below customary incubator temperature, i. e. about 36 C. The addition of 5 to 10 per cent of carbon dioxide to the atmosphere usually stimulates growth. If the cultures are placed in a closed vessel, the carbon dioxide can be blown in from a tank or a Kipp generator, or a small bit of solid carbon dioxide may be dropped in before the vessel is closed, or enough sodium carbonate and dilute sulfuric acid can be put together in a beaker to evolve the required volume of carbon dioxide, which can be readily calculated.

STIPPLED RED CELLS AND LEAD POISONING

To the Editor:—A man aged 52 has worked fourteen years as a furnace man in a lead refinery. He has 6 to 10 stippled red cells in each high power field. He has some of the symptoms of lead poisoning, including headache and prostration, but has no lead line, wrist-drop or abdominal symptoms such as colic and rigidity. What type of treatment is indicated and can he continue work?

J. E. Walton, M.D., Alton, Ill.

ANSWER.—Any one who has 6 to 10 stippled red cells in each high power field would be showing injurious effects of lead. It seems highly unlikely that a man would have that many stippled cells and still not have any lead line or lead colic, because this is a large number of stippled cells. If confirmed by further blood smears or, better, by additional evidence, the man should be relieved of his work until the stippling largely disappears. With the few symptoms present, probably the only treatment indicated would be ample calcium, best given in the form of milk.

THE TREATMENT OF CHRONIC LEUKEMIA BY SMALL DOSE ROENTGEN RAY TECHNIC

ANDREW H. DOWDY, M.D.

AND

JOHN S. LAWRENCE, M.D.

ROCHESTER, N. Y.

Leukemia is one of the most fatal of all diseases. No known cure exists. Once the diagnosis is established there is no ultimate hope for the patient, and the attending physician finds small comfort in the palliative role that his therapy plays. There is perhaps no disease to which the human body is heir which has shown so little progress in response to therapeutic measures. There is a fairly general agreement that the life expectancy is little if any prolonged by any known therapeutic procedure. Roentgen therapy is the accepted method today, and if it is properly administered and adjusted in amounts and frequency the comfort and efficiency of the patient can be increased by approximately 60 per cent.¹ If this cannot be accomplished, there is little justification for treatment. Acute leukemia should not be treated with roentgen rays, as there is seldom much response.

Despite the fact that roentgen therapy is the method of choice, there is great diversity of opinion as to the type of treatment to be used. Some advocate local (regional) treatment to the spleen or enlarged lymph nodes.² Irradiation of the chest has been tried and found effective.³ Recently irradiation of the trunk has been advocated.⁴ Others recommend irradiation of the entire body either by teleroentgen⁵ or the Heublein method.⁶ Individual dosage and frequency of treatment likewise are subject to wide variations. Many advocate moderate or small doses, but there is no general agreement as to what constitutes a small dose. A dose which was considered small several years ago might be con-

sidered large by today's standards. Until recently the literature on this subject had no accurate, uniform measurement of intensity but recorded doses in cutaneous erythemas or milliamperes minutes, stating the distance of the spark gap. The type of spark gap, whether point or sphere, was not always given. Such therapeutic chaos can be attributed to two factors: (1) the universal fatality of the disease and (2) the fact that there must be at least one and possibly two elements common to all technics of treatment with roentgen rays, namely the irradiation of lymphoid and myeloid structures or of the circulating blood. We feel that the latter of these two factors is the more important.

It is not our purpose in this paper to discuss in detail the various types of technic. Nor is any criticism directed at the many good articles on roentgen therapy of leukemia in the literature. The improvements in x-ray equipment and a better understanding of the physical factors, however, have rendered a number of our previous concepts of the various systems of dosage obsolete. For a thorough knowledge of any particular technic the reader is referred to the literature. Suffice it to state, however, that irradiation of the whole body is not without danger and is not applicable in all instances. The same difficulties are inherent in the Heublein method, and in addition the space required in conjunction with the specialized care needed in the conduct of the individual patient precludes this method from universal hospital and office use.

We wish to stress the individualization of the patient and the numerically small individual and total dose of roentgen rays required in roentgens (measured in air) to bring about a satisfactory response. The size of the area (square centimeters of surface) treated likewise is important, not only from the standpoint of back scatter but also from the volume of tissue actually irradiated. If, as some have stated, irradiation of the circulating blood is of primary importance,³ not only the volume of tissue irradiated but the irradiated site would play an important part. If this is true, irradiation over the precordium,⁷ the pulmonic fields, the spleen or the liver would probably show a greater response to a given number of roentgens per unit volume of tissue irradiated than would irradiation over enlarged lymph nodes in the axilla and the inguinal region. Our clinical observation would tend to bear out this point.

In any system of treatment the physical condition of the patient must be considered. This necessitates careful medical supervision and the general support of the patient with substitutional therapy as indicated. A close and sympathetic cooperation of the attending physician and the radiologist is imperative for the proper conduct of each patient.

We have attempted, during the past three years, to establish a small dose roentgen ray technic based on

dosage in roentgens (measured in air) in relation to the site and area in square centimeters of the part treated. This resolves itself into regional treatment of the spleen, the liver and the various involved lymph nodes, or treatment to various portions of the trunk.

Chart 1 (case 1).—Chronic lymphoid leukemia. Local technic used. Portal 10 by 12 cm. Total 350 roentgens. Note gradual reduction of white blood cell count.

In the latter, the trunk is divided into the following areas: (1) the anterior part of the chest and (2) the abdomen and (3) the posterior part of the chest and (4) the abdomen, hereafter designated the quadrant technic in contrast to the regional. In most persons these various quadrants average fields of 20 by 20 to 20 by 30 cm. In no instance were the fields larger than 30 cm. in diameter. Occasionally the abdomen was divided into four areas for treatment, 10 by 15 or 15 by 15 cm. In several cases the quadrant technic was supplanted by regional therapy in order that localized areas of lymphadenopathy might be more adequately treated. The purpose of this study was to produce a technic which would give a gradual reduction of the total white blood cell count, with the least amount of irradiation and

Chart 2 (case 2).—Chronic myeloid leukemia. Local technic used. Portal 10 by 15 cm. Total 700 roentgens. Irradiation confined to the spleen.

without any feeling of malaise or systemic reaction on the part of the patient such as increased toxicity. It was found that by either technic there was a decided variation in the threshold response in various persons. As the disease progressed, and with repeated series of roentgen therapy, there was noted the necessity of increasing the number of roentgens per individual

treatment. It has been noted in this study that approximately the same total of roentgens was effective whether given in large doses (100 to 150 per treatment) or in smaller doses of 50 roentgens each (charts 4 and 5). The comfort of the patient, however, was much greater with the latter small individual doses.

No predetermined white blood cell level is selected. Each case is individualized. Patients with exceedingly high initial counts may be more comfortable if the count is not reduced below the range between 40,000 and 50,000, while in other persons the count may be reduced to 25,000 or even 10,000 with advantage. Leukemia with leukopenia, if not a result of therapy, is no contraindication to roentgen therapy, but here the individual dose must be small and the regional technic used. In leukemia with leukopenia the differential count in conjunction with the general condition of the patient is an important guide. A shift to the right with symptomatic improvement, in myeloid leukemia, indicates a satisfactory therapeutic response. In general, persons with a high percentage of adult white cells, without anemia and with a normal count of platelets respond best. However, good therapeutic responses have been

Chart 3 (case 3).—Chronic myeloid leukemia. Quadrant technic used. Portal 20 by 30 cm. Total 275 roentgens. Note slight increase in white blood cell count after first two treatments.

obtained when such was not the case (cases 2, 4 and 5). In chronic leukemia, severe anemia, few platelets and a high percentage of immature white cells in the circulating blood generally indicate a terminal case or, at least, one in severe relapse, and, as a rule, little symptomatic improvement can be expected.

We do not wish to imply that persons with chronic leukemia, having a low red blood cell count and a low hemoglobin content, should not be given the benefit of conservative roentgen irradiation. Infiltration of the bone marrow by leukemic cells crowds out the erythropoietic tissue and interferes with the normal production of the red blood cells. Judicious irradiation by the quadrant technic, in small individual doses of 25 to 50 roentgens (in air), may destroy large numbers of the leukemic cells within the bone marrow, thus allowing sufficient room for the erythropoietic system to function more efficiently.

TECHNICAL PROCEDURE

With a new patient it is important to establish the tolerance and the individual susceptibility of the disease to irradiation. If the person has never received roentgen therapy it is good practice to initiate the treatments by using the local technic to the spleen or enlarged lymph nodes with an initial dose of 25 or 50 roentgens

(in air) applied to an area 10 by 15 cm. to 15 by 15 cm. It is not uncommon to note a temporary increase in the total white cell count with these small doses (charts 3 and 4). However, if after three or four such daily treatments there has been no reduction in the

Chart 4 (case 4).—Chronic myeloid leukemia. Quadrant technic used with large individual dose. Portal 20 by 20 cm. Total 700 roentgens. Note precipitous fall in white blood cell count.

total count and no associated increase in toxicity or other systemic reactions, the dose may be increased or one may change to the quadrant technic. It is seldom, if ever, necessary to go beyond a daily dose of 75 roentgens with either of these methods. With the local technic, treatments should be daily. With the quadrant technic and doses of 50 to 75 roentgens, the frequency may in a certain measure depend on the patient's geographic location and economic status. A count of white cells should precede each treatment. The reduction in the total count should be gradual. A rapid decrease necessitates interruption of the treatments until the count is stabilized. In the treatment of leukemia with leukopenia, the local technic only is advised and the daily dose should not exceed 50 roentgens, preferably 25 roentgens applied to an area 15 by 15 cm.

Technical factors involved in our treatment were: 200 kilovolts and 25 milliamperes; a 50 cm. skin-target distance and a filter of 0.5 mm. of copper and 1 mm. of aluminum.

REPORT OF CASES

The following reports will illustrate the various types of leukemia and their response to the small dose roentgen ray method employing the local and quadrant technics.

CASE 1.—Chronic lymphoid leukemia; local technic. A white man aged 51 was admitted Jan. 18, 1938 with a progressive enlargement in the left cervical region of three months' duration. This was promptly followed by similar swellings in the right cervical region and in the left groin. Examination revealed generalized enlargement of the peripheral lymph nodes with enlargement of the spleen 5 finger breadths beneath the left costal margin.

The red blood cell count was 5,000,000 per cubic millimeter; the hemoglobin content was 13.6 Gm. per hundred cubic centimeters of blood and the white blood cell count 168,000 per cubic millimeter. The differential count was as follows: segmented cells 3 per cent, lymphocytes 95 per cent and monocytes 2 per cent. The bleeding time was three and one-half minutes and the clotting time six minutes. There was a slight clot retraction after thirty-six hours. The platelets revealed some reduction.

The short history of three months' duration and no anemia in conjunction with the patient's good general condition would

lead one to expect a good symptomatic response. Such a response was obtained by the local technic with doses of 50 roentgens and a total of 350 roentgens for the series (chart 1).

CASE 2.—Chronic myeloid leukemia; local technic. M. M., a white woman aged 57, was admitted May 9, 1938. She was chronically ill. Six years before this admission the patient had been seen in the medical service with chronic glomerulonephritis and generalized arteriosclerosis. Six months prior to the last admission she had noted a mass in the abdomen which increased in size to fill the entire left half of the abdomen.

Physical examination revealed that she was thin and sallow. The heart was enlarged to the left, with a loud systolic murmur heard at the apex. The blood pressure was 120 systolic and 76 diastolic. The spleen occupied the entire left half of the abdomen. The liver was slightly enlarged.

The red blood cell count was 3,500,000 per cubic millimeter; the hemoglobin content was 6.0 Gm. per hundred cubic centimeters of blood; the white blood cell count was 224,000 per cubic millimeter. The differential count of leukocytes was as follows: basophils 6 per cent, eosinophils 1 per cent, myelocytes 55 per cent, segmented cells 34 per cent and lymphocytes 4 per cent. The number of platelets had decreased. The non-protein nitrogen was 95 mg. and the blood protein level 6.7 mg. per hundred cubic centimeters of blood. The urea clearance was 28 per cent in the first hour and 18 per cent in the second hour. The basal metabolic rate was + 21 per cent.

The patient's general condition, in conjunction with anemia, the decrease in platelets and a high percentage of immature white blood cells, would make prognosis for remission guarded. The local technic was used (on small areas 10 by 15 cm. confined to the spleen) with individual doses of 50 roentgens. A satisfactory remission was produced with a total of 700 roentgens for the series (chart 2).

The patient has returned twice with exacerbation in the past two years.

CASE 3.—Chronic myeloid leukemia; quadrant technic. L. B., a white man aged 58, admitted Feb. 6, 1938, had arteriosclerotic heart disease.

Physical examination revealed an enlarged heart with signs of congestive heart failure. The Wassermann reaction was positive.

The red blood cell count was 4,100,000 per cubic millimeter; the hemoglobin content was 9.8 Gm. per hundred cubic centimeters of blood; the white blood cell count was 73,000 per

Chart 5 (case 4).—Chronic myeloid leukemia. Quadrant technic used with small individual dose. Portal 20 by 20 cm. Total 750 roentgens. Same case as represented in chart 4 twenty-one months later. Note gradual decline in white blood cell count.

cubic millimeter. The differential count of leukocytes was as follows: basophils 2 per cent, eosinophils 1 per cent, myelocytes 17 per cent, stab cells 3 per cent, segmented cells 75 per cent and lymphocytes 2 per cent. The platelets were greatly reduced in number.

While the patient's general condition was not the best, his blood picture suggested a fairly good prognosis for a remission,

in view of a high percentage of segmented cells. A remission was accomplished by the quadrant technic with individual doses of 25 or 50 roentgens each and a total of 275 roentgens for the series (chart 3).

The next case is presented to show the contrast between the large dose and the small dose method of

Chart 6 (case 5).—Chronic lymphoid leukemia. Quadrant technic used. Portal 15 by 15 and 20 by 30 cm. Total 425 roentgens. Note increase in white blood cell count after first two treatments.

treatment of the same person. The portal size was the same in each instance. There is a period of two years between the two series of treatments, represented, as indicated, by charts 4 and 5. The larger doses are shown by chart 4 and were given two years before the treatment represented by chart 5.

CASE 4.—Chronic myeloid leukemia; quadrant technic; contrast between large and small doses. E. S., a white woman aged 26, was admitted Aug. 2, 1935 with the diagnosis of latent syphilis, early myeloid leukemia, bismuth stomatitis, Vincent's angina and dorsal scoliosis resulting from previous poliomyelitis.

The red blood cell count was 4,070,000 per cubic millimeter, the hemoglobin content 10.6 Gm. per hundred cubic centimeters of blood and the white blood cell count 136,500 per cubic millimeter. The differential count of leukocytes was as follows: basophils 1 per cent, eosinophils 1 per cent, myeloblasts 3 per cent, myelocytes 15 per cent, juvenile cells 14 per cent, segmented cells 60 per cent and lymphocytes 6 per cent. Platelets were abundant.

The patient was given solution of potassium arsenite up to 24 drops a day, and the white blood cell count was reduced from 160,000 to 10,000 per cubic millimeter. She did not tolerate this medication well, however, and in December 1935 she was referred for roentgen irradiation. At that time the blood showed 3,620,000 red blood cells per cubic millimeter, 9.4 Gm. of hemoglobin per hundred cubic centimeters and 140,000 white blood cells per cubic millimeter. The differential count was basophils 1 per cent, eosinophils 4 per cent, myeloblasts 80 per cent, segmented cells 10 per cent and lymphocytes 5 per cent.

The blood picture at this time was not encouraging for a remission, which was accomplished, however, with four daily doses of 150 roentgens each and one dose of 100 roentgens, totaling 700 roentgens for the series. Irradiation was confined to the anterior and posterior portals of the chest. It will be noted from chart 4 that the white blood cell count had risen to 200,000 per cubic millimeter the day before the first roentgen treatment. It will be noted also that the fall in the total count was precipitous and reached 32,650 per cubic millimeter on the fifth day of treatment. We believe that such a rapid decrease in the total count should be avoided and that the amounts of irradiation were excessive. Subsequent irradiation was given in August 1936.

In September 1937 the patient was again admitted with the following blood picture: red blood cell count 3,100,000 per

cubic millimeter, hemoglobin 6.5 Gm. per hundred cubic centimeters of blood, white blood cell count 360,000 per cubic millimeter. The differential count of leukocytes was as follows: myeloblasts 7 per cent, myelocytes 34 per cent, stab cells 22 per cent and segmented cells 37 per cent. This was a period two years later in the course of the disease, and the anemia was more profound. A satisfactory remission was accomplished with 11 small doses of 50 roentgens each and 2 doses of 100 roentgens, totaling 750 roentgens. The quadrant technic was used. It will be noted in chart 5 that at this admission the reduction of the white blood cell count from 360,000 per cubic millimeter to 26,800 per cubic millimeter was accomplished gradually over a period of nineteen days. Such a gradual reduction, we feel, is important for the safety of and the general sense of well-being on the part of the patient.

The patient died Nov. 20, 1938.

We recognize the fact that this case does not offer a perfect comparison of the results of the two different types of technic in the same person. The blood picture during the admission, represented by chart 4, was decidedly unfavorable. At that time there were 80 per cent myeloblasts. The precipitous fall in the total white cell count may have been due to this large number of immature white cells rather than to the larger individual doses of roentgen rays used. Our present feeling, however, is that such a high percentage of immature white cells necessitates the most conservative treatment. During the admission represented by chart 5 the blood picture was more favorable in that there were only 7 per cent myeloblasts and 34 per cent myelocytes. The more severe anemia would indicate progression of the disease.

Case 5 represents one with an unfavorable prognosis; the patient had previously been overirradiated while living abroad.

CASE 5.—Chronic lymphoid leukemia; quadrant technic. F. L., a white man aged 79, was admitted Aug. 31, 1939. He was chronically ill. Physical examination revealed him to be emaciated, with generalized enlargement of the peripheral lymph nodes. The liver and spleen were enlarged 3 cm. below the

Chart 7 (case 6).—Chronic lymphoid leukemia with low total white blood cell count. Local technic. Portal 12 by 15 cm. Total 325 roentgens. The lymphocytes fell from 78 per cent to 42 per cent and the segmented cells rose from 9 per cent to 48 per cent.

costal margin. There were minute petechiae scattered thickly over both legs.

The red blood cell count was 2,200,000 per cubic millimeter, the hemoglobin content 7.4 Gm. per hundred cubic centimeters of blood, and the white blood cell count 65,100 per cubic millimeter. The differential count of leukocytes was as follows: segmented cells 3 per cent, lymphocytes 63 per cent and mono-

cytes 1 per cent; 33 per cent of the cells were unrecognizable and were classified as "smudges." The number of platelets was greatly diminished. Before roentgen therapy was instituted, the total white cell count rose to 102,400 per cubic millimeter.

Irradiation was instituted with small doses of 25 to 50 roentgens to areas 15 by 15 cm. over the chest, then changed to 50 roentgens by the quadrant technic (chart 6). With a total of 425 roentgens for the series the count gradually fell to 16,000 per cubic millimeter during a period of eighteen days. The proportion of segmented cells rose to 13 per cent, and the number of "smudges" dropped from 33 per cent to 12 per cent. The patient was discharged Sept. 19, 1939.

This case is interesting from the standpoint of the poor prognosis and in view of the patient's previous overirradiation, which had resulted in a temporary leukopenic phase of the disease. The severe anemia, the reduction in platelets and the multiple petechiae pointed toward conservative irradiation, if any.

CASE 6.—Lymphoid leukemia with low white blood cell count; local technic. H. R., a white man aged 37, was admitted on Sept. 19, 1939 with a diagnosis of lymphoid leukemia and an enlarged, painful spleen. The patient dated the onset two years previously, after lobar pneumonia. The patient was chronically ill.

There was slight pallor of the skin. Large, firm, tender nodes were noted in the anterior cervical and inguinal regions. The spleen was enlarged 4 to 5 cm. below the costal margin on the left.

The red blood cell count was 4,800,000 per cubic millimeter, the hemoglobin content 13 Gm. per hundred cubic centimeters of blood and the white blood cell count 13,900 per cubic millimeter. The differential count of leukocytes was as follows: eosinophils 1 per cent, stab cells 2 per cent, segmented cells 15 per cent and lymphocytes 82 per cent. The platelets were slightly diminished.

The patient was given small individual doses of 25 roentgens each locally to the spleen and to the enlarged nodes for a total of 325 roentgens. The total white cell count fell to 3,700 per cubic millimeter, and the segmented cells rose to 48 per cent. There was some reduction in the size of the spleen, with good symptomatic response. A note from the blood clinic on Jan. 16, 1940 stated that the white blood cell count was 10,400 and the red blood cell count 4,500,000 per cubic millimeter, the hemoglobin content was 13 Gm. per hundred cubic centimeters of blood, and the patient was symptomatically much improved.

COMMENT

In the past three years, we have treated 20 different patients afflicted with chronic leukemia, with individual small doses of roentgen rays by the local or quadrant technic or by a combination of the two. Of these, 9 are known to be dead and 1 was lost track of after a period of two years. These 10 patients lived an average of two and seventy-seven hundredths years after the onset of the disease. The longest period of survival was five years, and the shortest was one year and three months. It seems certain that the life expectancy is not altered by these smaller doses but, in our experience, it has resulted in an increased degree of comfort to the patient in comparison with the higher individual doses of roentgen therapy. During the treatment periods, the patients are practically free from nausea and vomiting or a feeling of increased toxicity. After a series of treatments, their convalescence is more rapid. We cannot state that relapses have been less frequent. Of the 20 patients, 19 have required an average of two series since they came under our control.

It is our firm belief that persons with chronic leukemia may be overirradiated, and to overirradiate a patient is to court disaster. Irradiation in each case must be individualized. Some patients are more susceptible to the unfavorable reactions following roentgen

therapy than others, and the sensitivity of the white blood cells, as indicated by their decrease in the peripheral circulation, varies from person to person and at different times in the same person. Consequently, the total count is no criterion as to the size of the single dose or the total amount of irradiation required for any one series. It is essential that daily white cell counts be done before irradiation in all cases of chronic leukemia. In leukemia with leukopenia, a daily differential count of leukocytes must also be carried out.

SUMMARY

1. Chronic leukemia will respond satisfactorily to much smaller individual and total doses of roentgen rays than those commonly employed.

2. The object of the treatment is to secure the maximum symptomatic improvement and the minimum discomfort with the smallest amount of irradiation.

3. Any individual dose which produces nausea or a feeling of increased toxicity is likely an excessive dose.

4. There is a noticeable variation in patients' tolerance and in the individual susceptibility of the disease to irradiation.

5. A clearcut small dose roentgen ray technic, such as is presented, should be employed for the treatment of chronic leukemia.

6. The method is practicable in the hospital or in office practice.

HEPARIN AS A PROPHYLACTIC AGAINST THROMBOSIS

CLARENCE CRAFOORD, M.D.

AND

ERIK JORPES, M.D.

STOCKHOLM, SWEDEN

The use of heparin as prophylactic against thrombosis has arisen through our increased knowledge of this substance gained during the last few years. The latest developments in this field have been reviewed in two monographs of recent date.¹ The chemical nature of heparin is known. Being a mucicoin polysulfuric acid with not less than about 40 per cent of sulfuric acid, the heparin polysaccharide possesses an exceedingly high negative electric charge which enables it to react with some of the components of the coagulation system, preventing the coagulation of the blood. In the body it functions like a hormone, lessening the coagulability of the blood. Like other hormones, it is produced by a special kind of cells, the mast cells of the connective tissue, known to be located mainly in the neighborhood of the smaller blood vessels. The metachromatic granules of these cells consist of heparin. From these cells the heparin passes into the blood stream either directly or by means of diffusion. Under one experimental condition—peptone shock in the dog—heparin is thrown into the blood stream from these cells to such an extent that the blood is rendered completely incoagulable.

Since heparin is the body's own anticoagulant, it is the first one to be considered in attempts at counteracting thromboembolic complications. This idea was

From the Surgical Clinic I, Sabbatsbergs Hospital, and the Chemistry Department, Karolinska Institutet.

This investigation was aided by grants from the Rockefeller Foundation and from Stiftelsen Therese och Johan Anderssons minne.

suggested in 1930 by Howell and MacDonald,² under whose guidance heparin was discovered, and it was followed up as soon as pure heparin became available in Stockholm and in Toronto, Canada. Since the pure product is harmless when given intravenously in moderate doses, the main obstacle had been the difficulty in obtaining it.

A valuable contribution to our knowledge in this field was made, therefore, when in 1933 Charles and Scott³ of the Toronto group, working under Charles Best, found that heparin can be extracted on a large scale from the liver and lungs of cattle in a weakly alkaline solution from which the glandular residue is removed by coagulation in the presence of an excess of ammonium sulfate. From the alkaline extract the heparin is precipitated together with proteins on acidification. By further applying the same principles used by Howell a fairly good yield of heparin is obtained. A sufficient amount of heparin was obtained by this method for chemical analysis as well as for clinical experiments. Heparin was found to be a mucicetin polysulfuric acid,⁴ and once it had been established that it belonged to the same group of substances as chondroitin sulfuric acid, its occurrence in the mast cells of Ehrlich could easily be demonstrated by means of the metachromatic stain, which Lison in 1933 had shown to be caused by these substances.⁵ Successful experiments pertaining to its clinical use could also be started on animals as well as on man.

One of us (C. C.), working for many years on problems in connection with postoperative thrombosis, welcomed the possibility of obtaining heparin for experiments in this field. As soon as it had been shown in the spring of 1935⁶ that heparin could be given intravenously in man in doses sufficient to cause heparinization lasting for fifteen hours, a systematic series of experiments was started on patients in August 1935 in order to study the influence of heparinization on the frequency of postoperative thrombosis.

A preliminary report⁷ on these experiments was given in June 1937 (submitted for publication partly in February 1936 and partly in December of the same year). If the heparin used was sufficiently pure, it was found possible to perform the necessary heparinization of the patients. It was found less advisable to start the heparinization prior to or during the operation because of complicating hemorrhage. If the first intravenous injection was given three to four hours after the operation was finished there was no longer any danger of local hemorrhage in the field of operation. The heparinization was continued for the next three or four days either by giving repeated injections every fourth hour of the day or by means of an intravenous drip.⁸

In a series of convincing experiments on animals Murray and his associates⁹ and Solandt and Best¹⁰

demonstrated the usefulness of heparin in preventing the formation of clots in blood vessels after different kinds of lesions of the vessels. Heparin was used by them in an operation on the brachial artery as early as the spring of 1935. Its usefulness in vascular surgery, particularly in arterial embolectomies, was more clearly described in a later paper.¹¹ Particular stress was laid on the possibility of preventing mesenteric thrombosis after splenectomies and resections of gangrenous parts of the intestine.¹² As to the work done by these authors on the postoperative prevention of thrombosis and on the treatment of acute thrombi in man by means of heparin, reference is made to three papers in 1937 and 1938¹³ and to three recent¹⁴ articles by Murray.

The second report by Crafoord,¹⁵ in 1939, included 126 cases in which heparinization was regularly done after operation with four to six injections daily of 50 to 100 mg., making a total of 300 to 500 mg. of heparin a day. The use of the intravenous drip turned out to be fraught with such drawbacks that it was discontinued. Heparin was consequently given in single injections. Only occasionally a patient was awakened during the night to be given a dose. Usually the evening dose was somewhat larger, 100 to 150 mg.

The group of patients selected for postoperative heparinization consisted of persons over 35 years of age suffering from diseases with a fairly high percentage of thromboembolic complications. The patients selected submitted to operations on the gastrointestinal tract, on the biliary system or on the urinary passages or to major operations for hernia and varices. In this series the heparinization was continued over an average of seven days. The treatment with heparin was discontinued when the patient had a normal or a subfebrile temperature, had a better appetite and could move about fairly well, thus having circulatory conditions not far from the normal. The patient's general condition, temperature, pulse rate and blood pressure as well as the urinary status were followed in every case; and the blood picture was studied in 14 cases, in none of which were seen any undesirable reactions following treatment with heparin. In 5 cases local hematomas developed, four of them of no significance, but in the fifth case an infection occurred, erysipelas developed and the patient died, partly because of myocardial lesions.

In this group of 126 patients regularly treated with heparin there was not a single occurrence of thromboembolic complication. In the control series of 809 patients of about the same age and in the same department, undergoing similar operations, during the period 1935-1937, those followed after operation included 122 (15 per cent) displaying signs which could have been due to thrombosis, and among them 68 (8 per cent) presented definite thromboembolic complications. Among 129 operated on during the period 1937-1938 but not treated with heparin 33 showed signs of thrombosis and 20 showed distinct thrombosis. It should be pointed out that in this series of 129 non-heparinized patients during the period of heparinization of the others the patients were not suffering from circulatory disturbances or adiposity and were in good

general condition, so that there seemed to be less reason to expect thromboembolic complications in them than in the heparinized group. The main reason that not all the patients were heparinized was the lack of technical help for administering the heparin postoperatively to so many patients. Under such conditions we naturally selected for treatment those who were regarded as being in most danger of thromboembolic complications.

The result of this first series of experiments on postoperative heparinization being promising, the public health board of the city of Stockholm made possible further experimentation in this line.

In the final series of 201 cases, the same principles were applied as earlier in the selection of patients as well as in the treatment. Heparin was given in single

chemically heterogeneous product with about 70 per cent of the strength of the strongest samples of heparin available, the mucoitin trisulfuric acid of Jorpes and the "crystalline" heparin of Charles and Scott. In the terms used by Best and his associates, it thus contains about 70 units per milligram. Seeing that the strength of this preparation can be kept sufficiently constant for practical use, we have preferred to express the dose in milligrams of this heparin. If there were a crystalline heparin of definite strength, it would be a reliable substance for reference. So far, however, it is too early to make any statements on this topic. Jaques and Waters¹⁶ recently reported on heparin from the liver of the dog with a strength of 130 per cent of that of the "crystalline" heparin from the lungs of cattle.

intravenous injections, the number of which was limited to four daily. This time a somewhat smaller dose of heparin was tentatively given, usually 50 + 50 + 50 + 100 mg. of heparin of standard potency, making a total of 250 mg. a day. In certain cases 75 + 75 + 75 + 125 mg. was considered to be a more suitable dose. The first injection was given four hours after the operation.

The treatment was continued over a period of five to ten days, depending on the general condition of the patient. Particular stress was laid on an afebrile temperature and an almost normal mobility of the patient at the outset of treatment. During the last two days the dose of heparin was successively decreased.

The heparin used was a 5 per cent sterile solution of the commercial product manufactured by the Vitrum Company, Stockholm, in cooperation with one of us (E. J.). The strength of the preparation is kept fairly constant, within 10 to 15 per cent. It is an amorphous,

The results are given in tables 1 and 2. The tables include not only the last series of 201 cases in which heparinization was done from Nov. 1, 1938 to May 1, 1940 but the whole group of cases during a period of two and one-half years from Nov. 1, 1937 to May 1, 1940.¹⁷

Among the 325 patients given regular postoperative treatment with heparin there was not a single one with certain thromboembolic complications. In 3 cases only (1 per cent) a slight rise in pulse rate and temperature could have been caused by slight, undiagnosed thrombosis.

In the control group during the same period, comprising 302 unheparinized patients of about the same age undergoing similar operations, there were 33 (11 per cent) with certain thromboembolic complications

16. Jaques, L. B., and Waters, E. T.: *Am. J. Physiol.* 129:P389, 1940.

17. All the patients treated up till Oct. 31, 1939 were treated in the Surgical Clinic II of this Hospital, Prof. K. H. Giertz, surgeon in chief.

and another group of 15 (5 per cent) with a rise in pulse rate and temperature of unexplained origin. There were 9 deaths in which the postmortem diagnosis was thromboembolism and 18 patients had pain in the side and bloody sputum.

This series is similar to the control series of 809 cases from the same clinic, previously referred to, in which operations of the same kind were done during the pre-heparin period (1935-1937), in which there were 8 per cent showing certain thromboembolic complications and another 7 per cent showing less definite signs. In the two series, or 1,111 cases, the corresponding figures were 9 and 6 per cent.

The tables can be supplemented by data on a series of patients with gynecologic disorders heparinized postoperatively by P. Wetterdal in the department of gynecology of the Sabbatsbergs Hospital.

TABLE 3.—*Influence of Operation on a Patient's Reaction to Heparin (The Time of Coagulation in Minutes After a Certain Dose of Heparin Is Given)*

Before Operation		After Operation					Diagnosis
Before Heparin Injection	30 Minutes After Heparin Injection	30 Minutes After Injection of Heparin

ology of the Sabbatsbergs Hospital. In this series Wetterdal selected only patients operated on for myoma or for prolapse of the uterus. Eighty-eight such patients have hitherto been regularly treated with heparin postoperatively according to the scheme used in our latest series. There were no complications in Wetterdal's series, in spite of the well known frequency of thrombosis and pulmonary embolism in groups of patients with such disorders. Accidents of this kind occurred in about 4 per cent of his controls.

COMMENT

From physiology it is known that heparin is the anticoagulant of the body. The intricate nature of its function has been amply elucidated through the discovery of its formation in the mast cells of Ehrlich in the neighborhood of the blood vessels. Through the extraordinary synthesis of this peculiar kind of polysaccharide nature has provided an excellent anticoagulant, which can be used therapeutically in order to

prevent undesirable formation of clots. The experience hitherto gained also points in this direction.

An observation made by one of us (C. C.) at an early date is of particular interest in this connection. It was found that a larger dose of heparin is rendered inactive in the blood shortly after a surgical operation than is the case with the same patient before the operation. This is a clear expression of the tendency to the formation of clots which cause thromboembolic complications postoperatively. As is evident from table 3, the coagulation time is shorter on the day following operation after a certain dose of heparin than on the day before operation. In three or four days the original state of the blood is restored. It is evident that an auxiliary dose of heparin neutralizes the tendency of the blood to coagulate and greatly facilitates the restora-

tion of the normal state of coagulation. It is against this background that the favorable results of the postoperative treatment with heparin given in this paper are to be considered.

As is evident from the table, the heparinization seems to give a reliable protection against thromboembolic complications postoperatively. It has proved to be particularly valuable in cases in which, in all probability, such complications may be expected. Thus we know of some patients with umbilical hernia and renal calculi who were safely operated on although the surgeons would have refused to operate without the possibility of subsequent heparinization.

In the series of 201 cases in which heparinization was done there occurred no undesirable reactions. Evidently the treatment is quite harmless. In Sweden, at least thirty thousand doses of heparin of 50 to 100 mg. each have been given intravenously without any fatalities or any noteworthy drawbacks. In only 1 case symptoms developed which were of anaphylactic nature.

In animals the product is completely harmless. A dose of 10 mg. per kilogram has been given intravenously to 5 rabbits four times a day over a period of ten days without any influence on the blood picture and without causing detectable pathologic changes in the inner organs.

Less pure preparations of heparin, however, consistently give a rise in temperature and a chill within two hours. The symptoms disappear in one to two hours. This detail necessitated at one time careful checking of every new lot of heparin. There is also an individual hypersensitivity to pyrogenic impurities. Persons unexpectedly reacting after an injection of heparin were given heparin of another lot known to be absolutely free from these foreign pyrogens.

Little is known as to the dose of heparin necessary for the prevention of postoperative thromboembolic complications. We preferred in 1935 to begin with a dose which seemed to us to be sufficiently large. Our choice has proved to be correct. It remains in the future to find out the smallest dose sufficient to eliminate the tendency toward coagulation after surgical operations.

During the course of our experiments we gained the impression that heparinization should not be abruptly cut off. This has been demonstrated in several cases in which there were already existing thrombi. If heparin in such cases is suddenly withdrawn, it is not unusual to find a new pulmonary embolism within ten to fifteen days. The dose of heparin should preferably be decreased successively at the end of the treatment and in cases of existing thrombi be continued for as long a time as possible.

As to the question of the treatment of acute thrombi with heparin, no definite statement can so far be made, because of the unpredictable course of the thromboembolic complications. In our series, all the patients with such complications have been treated with heparin, some of them with a seemingly good result. At our suggestion regular treatment with heparin in somewhat large doses, 100 to 125 mg. three times a day, has been given with excellent results in cases of severe pulmonary embolism with fever and a bad general condition. There is, at any rate, no risk in giving heparin in cases of thromboembolic complications. Apparently the recovery proceeds more quickly if the formation of additional thrombi is counteracted or prevented by means of heparin.

SUMMARY

In 325 cases involving postoperative treatment with heparin symptoms of thromboembolic complications did not arise. In a control series of 1,111 similar cases such complications occurred in 9 per cent.

The patients selected were in both series over 35 years of age and submitted to operations on the gastrointestinal tract, the biliary system or the urinary passages or to major operations for hernia and varices.

Reference is made to another series of 88 patients with gynecologic disorders operated on for myoma or prolapsus uteri without any thromboembolic complications. In the control series of 1,054 cases there were complications in 4 per cent.

The heparin used had a strength of about 70 per cent of the pure mucoitin trisulfuric acid. It was given as a 5 per cent sterile solution in intermittent intravenous injections four times a day. The ordinary dose was 50+50+50+100 (or 75+75+75+125) mg. daily, started four hours after the operation. The treatment was continued for five to ten days.

GIARDIASIS AND ITS TREATMENT

A CLINICAL STUDY

HOWARD R. HARTMAN, M.D.

AND

FRANKLIN A. KYSER, M.D.

Fellow in Medicine, Mayo Foundation
ROCHESTER, MINN.

In recent years, atabrine (dihydrochloride of methoxychlorodiethyl amino-pentyl amino-acridine) has been described as a specific parasiticide for *Giardia lamblia*. Our clinical experience has substantiated this claim, and we are of the opinion that it is now possible to study the effects of giardiasis on human beings much more accurately than it was before a specific remedy for this parasite was known. Our interest in the subject was stimulated by a meeting of the Pan American Medical Association in 1938, and it was at that time that we first began our investigations. Our purpose in this paper is to review briefly a few pertinent contributions to our knowledge of the subject and to present an analysis of the symptoms in 100 cases of giardiasis and the effect of treatment with atabrine in 46 cases.

LITERATURE

Giardia lamblia, or *Giardia intestinalis*, is a flagellate of the intestine. Geographically, it has a wide distribution and knows no continental or climatic confines, although its occurrence is reported more frequently in warmer climates. It is widely disseminated through vertebrate hosts; it is found in mammals, reptiles, amphibians, birds and fish. It also has been found in the intestine of nematodes of South America. In the intestinal tract, the trophozoite of *Giardia* is found in decreasing numbers from the pylorus to the cecum. The cysts are more numerous in the stools of infected animals than is the vegetative form.¹ The *Giardia* of animals, according to Armaghian, Végheleyi² and others, is a small species distinct from that of man and is not infectious to man. *Giardia lamblia* of the human being is a pear-shaped organism 10 to 20 microns in length and 6 to 10 microns in width. It has a sucker disk on its ventral surface and four flagella. Its cysts are 6 to 7 microns in length; if moist, they can thrive for months outside the human body, but desiccation destroys them.

Giardia was discovered in the stools of human beings by Leeuwenhoek in 1681 and later was named after Lamb, who rediscovered it in 1859.³ The parasite is most abundant in the duodenums of human beings and of animals. In the United States, examination of stools reveals a varying incidence of the parasites. The greatest incidence of infection² is among children. Boeck⁴ reported that 6.5 per cent of adults and 22 per cent of children are infected. The parasite probably would be found more frequently if it were sought in the secretions obtained by duodenal drainage. It should be emphasized that it is sometimes difficult to obtain an adequate sample of duodenal contents. Frequently the parasites are not found in aspirated material because the material obtained is gastric instead of duodenal.

Boeck emphasized that three specimens that are known to come from the duodenum should be examined before the conclusion is made that parasites are absent.

Clinical articles on the subject of the pathogenicity of *Giardia* usually announce that giardiasis does not produce symptoms. The author of such an article then proceeds to present clinical evidence which demonstrates that *Giardia* produced the symptoms in his series of cases. De Muro⁵ commented in a similar vein and reviewed Kennedy and Rosewarne's study of 200 cases in which pure infection with *Giardia* caused diarrhea and then reported his own clinical study of cases dating from 1881. In de Muro's series of 45 cases enteritis was present in 28. There was a discordance in this group between the severity of the general symptoms, such as profound asthenia, depression and apathy, and the slight local symptoms of pain in the colon, meteorism and cramping pain in the stomach. Three of the patients in his series had rectocolitis; they recovered after treatment with atabrine. Fourteen had enterohepatobiliary disease. When erosive duodenitis resulted, the symptoms were similar to those of ulcer; when the hepatic system was invaded, the symptoms

were similar to those of cholangitis, cholecystitis or hepatitis. De Muro quoted divergent opinions as to the ability of *Giardia* to produce inflammatory lesions in these organs. He was of the opinion that the data studied favored the pathogenic actions of *Giardia*.

Lyon and Swalm⁶ in a thorough review of the records of 3,200 cases stated that *Giardia* may constitute a contributing factor to a state of disease or dysfunction, particularly disease which involves the biliary tract, duodenum and jejunum. Kraemer and Asher⁷ maintained the opposite view after they had studied the records of 31 cases of giardiasis. These authors stated that *Giardia* is a harmless invader of the gastrointestinal tract and that its presence may be disregarded. Despite the varying attitudes as to whether or not *Giardia* is pathogenic, in numerous clinical reports in the literature the symptoms are considered to result from giardial infection.

According to Spears,⁸ the most prominent symptoms are pain, nausea, vertigo, vomiting, distention, weakness, diarrhea, constipation and jaundice.

Lyon and Swalm are of the opinion that *Giardia lamblia* by its number alone could cause obstruction of the biliary tract, although these authors stated that they have been unable to trace any authenticated case in which *Giardia* actually invaded the gallbladder or biliary ducts. However, Calder and Rigdon⁹ more recently reported that a man aged 57 died as a result of giardiasis. Fever and leukocytosis were accompanied by vomiting of blood and diarrhea; *Giardia lamblia* was present in the vomitus and feces. At necropsy, the wall of the gallbladder was autolyzed; the gallbladder was filled with a brownish black fluid in which masses of *Giardia lamblia* were found.

Véghelyi studied 155 children who were infected with *Giardia lamblia*. Some of them did not have symptoms, but 47 had anorexia, 49 had headache, 33 had attacks of dizziness, 41 had abdominal pain, 19 had bloody stools in which pus was present and 57 had irregular bowel movements. Of the 155, 92 showed no evidence of disease other than giardiasis; the symptoms in this group of patients were definitely relieved by treatment with acetarsone.

Little¹⁰ was of the opinion that vertigo, dryness of the skin, lassitude, weakness and mental depression occasionally may be the result of giardial infection.

From this brief review it is obvious that there is not a clearcut syndrome for giardiasis. The reason for this seems to be that when the organism does act as a pathogenic agent the symptoms that result from the infection are distinctly pleomorphic.

ANALYSIS OF CASES

This series consists of 100 cases encountered at the Mayo Clinic in which *Giardia lamblia* was present in the duodenal contents, the feces or both.

Sixty-seven of the patients were males and 33 females. The ages ranged from 2½ to 70 years; only 5 of the patients were less than 14 years of age.

Fifteen patients had organic disease other than giardiasis: Four had duodenal ulcer, 5 had disease of the gallbladder, 3 had chronic ulcerative colitis, 1 had diverticulosis, 1 had sprue and 1 had cirrhosis of the liver.

In 11 cases *Giardia* was an incidental finding. In these cases there were no symptoms which possibly could be attributed to the parasite.

The symptoms encountered in this series are classified according to frequency in table 1, and the incidence of other organic lesions is given. In table 2 the cases are classified according to geographic distribution.

Diarrhea was present in 60 cases, in 8 of which there were other organic lesions. Thus in 52 per cent of cases the only apparent cause of diarrhea was giardiasis. The number of stools a day varied from two to twenty. The stools in all cases were loose and watery. Blood was present only occasionally.

Pain or distress in the upper portion of the abdomen occurred in 41 cases; in 9 of these organic lesions were found. This symptom varied from a sensation of epigastric fulness to a dull epigastric ache. In several cases the pain was localized to the right upper quadrant. Pyrosis and flatulence were frequent complaints.

Pain or distress in the lower portion of the abdomen was present in 24 cases, in 3 of which organic lesions were present. This discomfort manifested itself most

frequently as a crampy sensation associated with a desire to defecate. The pain usually was generalized over the entire lower portion of the abdomen and was relieved by defecation. Only rarely was a dull ache confined to the right lower quadrant.

Nervous symptoms such as asthenia, irritability and worry were the major complaints of 34 patients. Many of these patients were extremely neurotic and worried over the most trifling problems.

Fever was evident in 6 cases. In 1 of these, chronic ulcerative colitis was present. The fever was intermittent in most cases; the highest temperature recorded was 102 F. Chills were present in 3 cases.

Vomiting was present in 10 cases. Two of the patients had duodenal ulcer and 1 migraine. Vomiting occurred intermittently and was not the chronic type frequently associated with obstruction.

This analysis of symptoms is not intended to portray the idea that in all cases the complaints were the result of giardial infection. Despite the fact that in many of the cases organic lesions could not be found, a statement that the parasite was the sole etiologic agent is not justified. No doubt, some of the complaints were entirely functional. It must be pointed out also that in many cases *Giardia* can be an entirely harmless invader, as demonstrated in this series by the 11 cases in which the organism was discovered incidentally.

The fact must be made clear, however, that in this series of cases diarrhea was present in 60 per cent and abdominal pain in 65 per cent. This is more than coincidence, since in a certain group of cases eradication of the parasite with atabrine resulted in a distinct relief of symptoms.

Despite the occurrence of nervous symptoms, asthenia, irritability and worry in 34 per cent of the cases, these complaints are too universal in almost all forms of illness to attach any special significance to their presence.

It is entirely probable that in rare instances chills and fever may be caused by giardiasis. It is wise to consider this possibility in examination of a patient who has a fever of obscure origin.

TREATMENT

Until 1937 satisfactory treatment for giardiasis was not available. In 1931 Banerjee¹¹ stated that there was not any specific treatment for *Giardia lamblia*. De Paula e Silva¹² stated in 1935 that after several remedies were tried the coincidental symptoms vanished, with disappearance of the parasite, although the irrelevant symptoms remained. The coincidental symptoms were those referable to the biliary system or the duodenum or those produced by a more general intestinal infection. The irrelevant symptoms were more polymorphic.

Brumpt¹³ in 1937 reported cures in 80 per cent of his animals. He gave a 1 per cent solution of basic acridine dye by mouth. Galli-Valerio¹⁴ in 1937 used a derivative of acridine, commercially called atabrine, and had prompt and striking results in effecting a cure of giardiasis. Bacigalupo,¹⁵ at a meeting of the Pan American Medical Association in Cuba in 1938, reported

his striking results with atabrine. De Muro¹⁶ in 1939 reported that the oral administration of atabrine was more effective than the intramuscular administration in freeing patients of *Giardia*. He found that the disappearance of the organisms was accompanied by great relief of symptoms. The phenomenal results were received with skepticism until our experience revealed the therapeutic efficiency of the drug in cases of giardiasis.

Recently, Nutter and his collaborators¹⁷ studied 23 cases of giardiasis among human beings. Fourteen of these were studied in detail and the effect of atabrine was noted. These workers were of the opinion that atabrine dihydrochloride was highly effective in eradicating the parasite.

In our series of 100 cases, atabrine was employed in 46. Treatment consisted of 0.1 Gm. (1 tablet) three times a day for five days. Administration of the drug was then discontinued and examination of the stools for the presence of parasites was carried out. In certain cases, the duodenal contents also were examined. It should be pointed out that the parasite rarely is found

in the duodenal contents without being present in the stool. In this type of case, as mentioned by Boeck, the importance of adequate duodenal aspiration cannot be overemphasized.

No contraindication to treatment with atabrine was encountered in this series. However, many physicians from Latin American countries, who frequently use atabrine in the treatment of malaria, have communicated with one of us (Hartman), and the consensus indicates that advanced hepatic disease definitely contraindicated the use of the drug.

In our group of 46 cases in which atabrine was used, it was impossible to obtain a follow-up examination of the stool in 11. This leaves only 35 cases in which the effect of atabrine can be evaluated. In all but 1, treatment was successful in eliminating the parasites. Thirteen cases in which the symptoms presumably were attributable to giardiasis are presented in detail.

REPORT OF CASES

CASE 1.—A woman aged 30 came to the clinic from the Philippine Islands for examination. She complained primarily of physical exhaustion, which was attributed to an environmental neurosis. This manifested itself in various ways, the

most important of which was hyperhidrosis. The patient also complained that for many years epigastric pain had occurred soon after meals, associated with much bloating, belching and constipation. This is not the sequence of symptoms produced by ulcer. Massive infection with *Giardia* was found in the stools; because of negative results of laboratory studies, including roentgenograms of the gallbladder, stomach and duodenum, a course of 15 tablets of atabrine (0.1 Gm. each) was given. The patient stated that the abdominal symptoms disappeared after administration of the second tablet. At the end of the fifth day, examination of the stool failed to reveal parasites. Eight days later the patient was still free of symptoms. No subsequent report is available.

CASE 2.—A woman aged 40 who came from Peru gave as her chief complaint epigastric pain which occurred after meals, with much gas and bloating of two years' duration. Diarrhea had alternated with constipation. She was emotionally unstable and had attacks of depression, tachycardia and migraine. *Giardia lamblia* was found in the stools. Duodenal drainage was refused. After the eighth dose of atabrine, the patient maintained that all the abdominal complaints had disappeared as well as the irrelevant symptoms referable to the central nervous system. The patient returned to the clinic six months later and stated that she had continued to feel well and that she did not have a complaint of any kind.

CASE 3.—A man from Mexico aged 35 registered at the clinic. He complained of chronic recurring diarrhea of five years' duration associated with nausea, vomiting and much bloating. A diagnosis of duodenal ulcer was made on roentgenologic examination, for which medical treatment was instituted. The patient suffered from emotional instability which was attributed to environment. *Giardia* had been found in the stools in Mexico and in the duodenal contents at the clinic. A course of 15 tablets of atabrine was instituted. On the second day of treatment there was considerable relief of the abdominal cramps that were associated with the diarrhea; the latter complaint disappeared several days later. *Giardia* was not found in the duodenal contents eight days after institution of treatment. Stools were not examined. Thirteen months after treatment the patient reported perfect health without limitations of any kind, including diet. He had gained 16 pounds (7.3 Kg.).

CASE 4.—A woman aged 39 who came to the clinic from Peru gave as her chief complaint a twenty-year history of epigastric distress which would occur two hours after meals. The distress had been relieved by food and sodium bicarbonate. A sensation of fullness in the upper portion of the abdomen and occasional attacks of vomiting were associated with this distress.

The patient did not have any systemic organic disease except uterine fibroids, but *Giardia* organisms were present in the stools. Hysterectomy was performed. A course of 15 tablets of atabrine was given and on examination of the stool and duodenal contents seventeen days later parasites were absent. The symptoms referable to the gastrointestinal tract disappeared after treatment of the giardiasis. A report forty-eight days later revealed that the patient was in excellent health and did not have a complaint of any kind.

CASE 5.—A man from Mexico aged 36 registered at the clinic and gave as his chief complaint much gas and belching which would begin fifteen minutes after meals and would last for an hour. This distress was temporary and was eased by additional food. The condition had existed for eight years. The patient had acute diarrhea and frequent headaches. *Giardia lamblia* was found in the stools. A course of 15 tablets of atabrine was given, with the result that seven days later the stools failed to reveal the presence of parasites. The diarrhea and belching were much less severe; the patient stated that his stomach felt normal. He gave the same report ten days after cessation of treatment, and a letter received more than five months later reported that he had continued in good health.

CASE 6.—A man from Indiana aged 37 came to the clinic primarily because of early essential hypertension. He had mild

diarrhea but no other gastrointestinal complaint. *Giardia lamblia* was found in the duodenal contents and in the stool. A course of 15 tablets of atabrine was given, which resulted in disappearance of *Giardia* from the stools. Reexamination by duodenal drainage was refused. The patient stated that after the treatment, the diarrhea had disappeared completely and that he felt much improved. He was reexamined at the clinic about four months after treatment and still felt well, with no return of his former complaint.

CASE 7.—A woman from Mexico aged 32 came to the clinic and gave a seven year history of constipation and attacks of acute epigastric pain which had been more severe in the two years prior to registration. Recently the patient had noticed a sharp pain which had extended from the right costal margin to the right scapula. A diagnosis of cholecystitis had been made by the physician in her home locality and cholecystectomy had been advised.

The patient was nervous, introspective and suffered from migraine. Examination of the duodenal contents at the clinic revealed the presence of *Giardia lamblia*. A course of 15 tablets of atabrine was given and *Giardia* disappeared from the duodenal contents. The stools were not examined. The patient stated that after treatment all symptoms disappeared and that she slept without pain for the first time in months. Six days later she was still free from all symptoms, and in a letter seven months after treatment she stated that she was feeling well and that her previous symptoms had not returned.

CASE 8.—A man aged 50 who came to the clinic from Salvador, Central America, on Dec. 28, 1939 complained of fever associated with nausea after eating, severe pain in the right upper quadrant of the abdomen and loss of 45 pounds (20.4 Kg.). In 1937 he had had attacks of high fever after gormandizing. This fever lasted only a few hours. In August 1939, paresthesias of tingling and a sensation of stiffness developed in the inner aspect of the right knee and along the distribution of the right ulnar nerve. When his body was horizontal he had a pain along the lateral surface of the right twelfth rib. These symptoms had been treated at home by vitamin therapy with indifferent results. In November the patient began to have severe chills and fever, the temperature reaching 103.6 F. every fourth day. The neuritis became more severe. Sulfanilamide was tried without resultant improvement; frequent washing of the nasal sinuses also failed. Dyspnea, tachycardia and even delirium had ensued. Injections of arsphenamine had controlled the peaks of fever.

However, a new type of fever followed. The patient had begun to have daily attacks of low grade fever from 11 a. m. to midnight. These attacks had their onset early in December and continued after his arrival at the clinic. The patient was extremely debilitated and transportation was possible only in a wheel chair. Careful search for the presence of malaria, typhoid and paratyphoid was carried out. Results of agglutination tests for *Brucella* had given negative results in the hospitals of Salvador and Guatemala.

On examination at the clinic, the patient was pale, weak and thin; his systolic blood pressure, measured in millimeters of mercury, varied from 138 to 174; his diastolic, from 87 to 114. Examination of the ocular fundi disclosed arteriosclerosis grade 2 (on a basis of 1 to 4). His pulse rate varied from 102 to 120. He had daily elevations of temperature to 100 to 101 F. late in the afternoon. Urinalysis revealed pyuria grade 4, which later was found to be the result of mild prostatitis. Intravenous pyelography failed to visualize the left kidney. Culture of the urine revealed a green-producing streptococcus. The concentration of urea was 20 mg. per hundred cubic centimeters of blood. The value for hemoglobin was 9.6 Gm. per hundred cubic centimeters of whole blood, erythrocytes numbered 4,690,000 and the leukocytes varied between 10,400 and 15,700 per cubic millimeter of blood. The differential count was normal. Smears of the blood were not diagnostic of any toxic state. Plasmodia were not found. Results of the Kline, Kahn, Hinton and Kolmer tests were negative. The sedimentation rate of erythrocytes was 82 mm. an

hour. Bromsulphalein tests for liver function revealed retention of dye, grade 1. Results of agglutination tests for Brucella, typhoid and paratyphoid were negative. Blood cultures were negative. Roentgenograms of the frontal sinuses revealed thickened membranes, but on investigation active infection was not discernible. A roentgenogram of the thorax revealed nothing abnormal.

Giardia lamblia was found in the stool and in the duodenal contents. On Jan. 3, 1940 a course of 15 tablets of atabrine was instituted. On January 5 the patient reported that he felt much better, was more alert, was less fatigued, was eating well and did not have nausea. His temperature was normal then and subsequently. This was five days after institution of treatment with atabrine without other form of treatment. On January 9 duodenal drainage failed to reveal the presence of *Giardia*. On January 10 medication was prescribed for the deficiency of hemoglobin. By this time the patient had abandoned his wheel chair. By January 16 he had gained 4½ pounds (2 Kg.) and was able to walk several blocks to the dentist and spend two and a half hours in the dentist's chair for the treatment of several septic teeth. He still complained of some neuritic pains. The sedimentation rate on January 15 was still elevated to 91 mm. an hour.

On dismissal forty-one days after institution of treatment, the patient was in good health in spite of secondary anemia. The value for hemoglobin was 9.4 Gm. Erythrocytes numbered 3,830,000. A bromsulphalein test of liver function still indicated a retention of dye, grade 1. Cystoscopic examination did not reveal any abnormality on the right side, but the left ureteral orifice was not visualized and there was no excretion of indigo carmine from the left kidney. Because of the results of the previous intravenous pyelogram and the cystoscopic study, a diagnosis of asymptomatic functionless left kidney was made. The patient's appetite was excellent and he had gained 21 pounds (9.5 Kg.). All symptoms disappeared; he was dismissed with instructions to return if any further symptoms developed. A year later the patient returned to the clinic for further examination of the renal condition, but he had been free of symptoms since his previous visit. Frequent examinations of the stools by the physician in his home locality had never revealed the presence of *Giardia*.

CASE 9.—A man from Iowa aged 23 came to the clinic stating that a week prior to registration he had ingested an orange and a soft drink in the early evening and soon after this had had an aching pain in the lower portion of the abdomen. The next morning diarrhea developed which consisted of six to seven loose, watery stools during the day. Pain in the lower portion of the abdomen continued. The diarrhea persisted for a week; during this time the patient passed ten to twelve stools daily but no blood was visible. The patient had eaten little food because eating seemed to increase the abdominal discomfort.

Results of general examination were negative. Proctoscopic examination revealed no abnormalities, but *Giardia lamblia* was found in the stool. The sedimentation rate was 54 mm. an hour and the blood count was normal. A course of atabrine was instituted and the patient was much improved the next day. He continued to improve, and five days after institution of treatment parasites were not found in the stool. The diarrhea was completely relieved. On dismissal, the patient felt well; no further report is available.

CASE 10.—A man from Brazil aged 21 came to the clinic because of a dull, burning pain across the upper portion of the abdomen. This discomfort appeared approximately four hours after meals and was not relieved noticeably by food. The patient stated that he had a feeling of fullness in the epigastrium with much gas in the lower part of the bowel after eating. The patient always felt tired and was unable to sleep well. He was nervous and introspective.

Roentgenographic studies on the gastrointestinal tract and laboratory examinations revealed nothing abnormal except for the presence of *Giardia* in the stool and duodenal contents. The patient stated that *Giardia* frequently had been found in his stool in South America. He was given a course of atabrine

consisting of 15 tablets; three days after finishing the course of medication the patient stated that he was almost relieved of all symptoms. A report from the patient one year later stated that he continued to enjoy good health.

CASE 11.—A woman aged 35 who came to the clinic from Colombia complained of attacks of diarrhea for a year and a half. These attacks appeared every one to two months and lasted for six to seven days. During the attacks, the patient had some generalized pain in the lower portion of the abdomen with a moderate amount of gaseous distention. Blood had never been present in the stool and the patient had not lost weight.

Results of general examination were negative; a roentgenogram of the colon did not reveal any abnormality. *Giardia* was present in the stool and duodenal contents. The patient was given a course of atabrine; this medication resulted in disappearance of the parasites from the feces. Reexamination of the duodenal contents was refused. The patient was dismissed from the clinic three days after examination of the stool was negative for parasites. The diarrhea was improved significantly. A letter from the patient six months later revealed that she was enjoying good health and that her former troublesome complaints had not returned.

CASE 12.—A man aged 41 came to the clinic from Puerto Rico for investigation of stomach trouble. The patient stated that his bowels had always been constipated, but during the four months prior to registration he had noted a dull epigastric pain, occasionally awakening him at night. This distress always was relieved by food or milk.

Roentgenographic examinations of the stomach and gall-bladder gave negative results, but *Giardia* was present in the stool. The patient was given the usual course of 15 tablets of atabrine and seven days later examination of the stool did not reveal any parasites. He immediately began to feel better but complained of nervousness. He was given phenobarbital and an anticonstipation diet. He stayed under observation for almost a month, and when he left the clinic his health was much improved. In a letter four months later the patient stated that he had continued to enjoy good health after his dismissal from the clinic.

CASE 13.—A man aged 38 came to the clinic from Puerto Rico for a general examination. His only complaints were plantar warts and a slight feeling of epigastric fullness after eating and some sour eructations. This condition was always aggravated after indiscretions in regard to food.

General examination gave negative results. Roentgenologic and gastroscopic examinations revealed no abnormalities of the stomach. The stools contained *Giardia*, however, and he was given a course of 15 tablets of atabrine. On completion of medication the stools were free of parasites. At the time of dismissal from the clinic the patient's epigastric distress had disappeared; in a letter seven months later he stated that he was continuing to enjoy good health.

SUMMARY AND CONCLUSIONS

Of 100 cases of *Giardia lamblia* encountered at the clinic treatment with atabrine was employed in 46. Follow-up examinations of the stools were obtained in 35 cases. The results of our treatment with atabrine reported in this paper are based on these 35 cases only. In this group all the patients but 1 were freed of parasites on treatment with atabrine. This means that in these cases the drug was 97 per cent efficient in eradicating *Giardia* from the intestinal tract. Because atabrine may be considered a specific remedy for giardiasis, much progress may be expected in the study of the pathogenicity of *Giardia*. That the parasite was probably the true etiologic factor in the thirteen cases reported in detail is substantiated by the fact that removal of parasites by the use of atabrine completely relieved each patient of symptoms for a significant period.

CLASSIFICATION OF PRIMARY ENCEPHALITIDES OF MAN ACCORDING TO VIRUS ETIOLOGY

PRESENT STATUS

LESLIE T. WEBSTER, M.D.

NEW YORK

The term primary encephalitis is applied to cases of inflammation of the brain not accompanied by physical or chemical injury, bacterial or parasitic infection or tumor. These cases present evidence of the presence of an agent which affects primarily and directly the brain tissue—fever, lymphocytes in the spinal fluid, clinical signs indicating involvement of brain cells and, at autopsy, mononuclear, polymorphonuclear and neuroglial cells beneath the meninges, about the blood vessels and surrounding necrotic nerve cells. Further clinical classification has proved difficult.

Recently, advances have been made in grouping these conditions according to the virus causing them. By 1881 rabies was proved to be due to a virus which attacked chiefly nerve tissue; in 1909 poliomyelitis was shown to be due to a virus with a special predilection for the spinal cord and brain. In 1917 a summer epidemic of disease of the central nervous system among children in Australia, X disease, was found to be associated with a virus which acted chiefly on nervous tissue. During the same year, another form of encephalitis made its appearance in Europe and spread widely. Its clinical and pathologic features were described by von Economo but no etiologic agent was then or has since been isolated. In the summer of 1933 an epidemic of encephalitis centering in St. Louis was proved to be due to a type of virus acting on the central nervous system. In 1936 a summer encephalitis, type B, occurred in Japan and was found to be caused by a virus closely resembling the St. Louis virus. In 1938 the so-called equine encephalomyelitic viruses were shown to be capable of producing encephalitis in man. Furthermore, the virus of louping ill of sheep, the virus of lymphocytic choriomeningitis, presumably of mice, and the B virus, supposedly of monkeys, have all proved capable of causing encephalitis in man. At present, therefore, nine forms of primary encephalitis have been proved to be due to viruses with affinity more or less for the central nervous system; one additional clinical form, that of von Economo, has failed to elicit a recognizable agent, and other indefinite forms, which are undoubtedly numerous, remain etiologically undefined.

The striking features of each of these virus encephalitides are summarized in the accompanying table.

CLASSIFICATION

Rabies, caused essentially by an animal virus, transmitted to man by a bite, may occur in any one at any time. A definite diagnosis is entirely practical but must await postmortem examination of tissues for the presence of typical Negri bodies in the large nerve cells of the hippocampus or the demonstration of virus by inoculation of brain tissue into animals, preferably mice. The virus is confined to the central nervous system, peripheral nerves, salivary glands and, occasionally, adrenals. It is virulent for all species of animals tested.

Poliomyelitis is unknown in any host other than man and its mode of transmission is unknown; it occurs

usually in the summer months in children. A clinical diagnosis is uncertain in the absence of paralysis of a typical lower motor neuron type. A definite diagnosis must await postmortem examination of tissue for the presence of characteristic necrosis of anterior horn cells, accompanying hemorrhage, perivascular reactions, mononuclear and neuroglial cell infiltrations and neuronophagia. The most critical evidence accrues from the demonstration in nerve tissue alone of a virus which is pathogenic chiefly for monkeys. Such a critical diagnosis is laborious, expensive and unpractical. The virus is confined to the nerve tissue of the host but may be found occasionally in the nasal washings of patients and contacts, as well as in the stools of patients and contacts, and in sewage.

St. Louis encephalitis is likewise unknown in hosts other than man and its mode of transmission is unknown. The disease has centered thus far in the Midwest and has occurred in the summer months, chiefly in adults. A clinical diagnosis solely on the basis of signs and symptoms is hazardous but can be established definitely by serologic tests on the patient's blood. Specific neutralizing antibodies appear in most cases within two weeks, and a search is now being made for specific complement fixing antibodies. The test for neutralizing antibodies is practical only in those laboratories in which many viruses are being actively maintained and in which neutralization tests are being run as a routine; the complement fixation test is simple to perform and is practical in any laboratory. The few patients tested for fixation of complement have given positive results at two years and negative ones at seven years. At autopsy the lesions are not specific, but diagnosis is readily established by the demonstration of virus in the brain tissue by inoculating it intracerebrally into mice. The virus is present only in brain tissue. It is highly virulent for mice and slightly so for monkeys.

Japanese B encephalitis, a close counterpart of St. Louis encephalitis, may well have animal reservoirs and be transmitted by insects. It has been found thus far only in Japan and is indistinguishable epidemiologically and clinically from St. Louis encephalitis. Sheep, horses and other animals have been shown to possess specific neutralizing antibodies in their serums, and mosquitoes have proved capable of transmitting the disease under conditions of experimental infection and transmission. As in the case of St. Louis encephalitis, a clinical diagnosis cannot be made definitely from the signs and symptoms but the blood of convalescents does contain specific neutralizing antibodies and, presumably, complement fixing antibodies. The diagnosis can be readily established not only in the patient but at autopsy as well, not by examination of tissues, for these show no lesions specific to this virus, but by isolation of the virus from brain tissue by intracerebral inoculation of mice. The virus is highly virulent not only for mice but for monkeys and sheep, and in these larger animals it causes much destruction of the Purkinje cells of the cerebellum. It is serologically distinguishable from the virus of St. Louis encephalitis.

Louping ill appears to be essentially a primary encephalitis of sheep in Scotland and has not been known to be transmitted to man in nature. The disease is conveyed by insects and is caused by a virus indistinguishable from the virus of Japanese B encephalitis except for the neutralization and the complement fixing antibodies, which are specific. This virus gave rise

to encephalitis in 3 laboratory workers in this country in whom specific neutralizing and complement fixing antibodies developed, which, in 2 patients recently tested, have persisted for eight years.

X disease, known only in man and unknown as to its mode of spread, has been recognized only in Australia. It occurred there in the summer months of 1917 and 1918 and again in 1925 in children, in the form of encephalitis. Postmortem examination of brain tissue disclosed extensive involvement of the Purkinje cells. From the brain tissue a virus was recovered which was virulent for monkeys and for sheep. Unfortunately this virus was not preserved; hence further information is lacking.

Especially noteworthy here is the close relation between the viruses of the Japanese B encephalitis,

Lymphocytic choriomeningitis is probably a disease of mice which is transmitted to man in some unknown manner. Man is subject to it at any time and at any age. The virus can often be recovered from the blood or spinal fluid of the patient and complement fixing antibodies appear early and disappear early, while neutralizing antibodies appear late and persist. The infection has not proved fatal to man, hence the distribution of the virus is known only in animals. Animals show few lesions besides accumulations of lymphoid cells in the meninges and choroid plexus. The virus is virulent for mice, monkeys and guinea pigs.

"B" virus is probably native to monkeys. In 1932 it was transmitted to a laboratory worker through the bite of a monkey and, following the development of an ascending myelitis, proved fatal. The virus was

louping ill and X disease and the similarity in the epidemiology of diseases caused by these and the St. Louis viruses.

Equine encephalomyelitis is essentially a disease of horses rather than of man. The causative virus gains entry to the body from some reservoir, possibly birds, and possibly through the bite of an insect. From the portal of entry it makes its way directly to the brain, where it incites inflammatory reactions and damages brain cells. Recently this virus has been found to infect man. In the summer of 1938 an outbreak of the disease occurred among children in Massachusetts and since then other outbreaks have been recognized among adults. An accurate clinical diagnosis can be made by the demonstration of neutralizing or complement fixing antibodies in a patient's serum two weeks or more after infection. Both types of antibody persist for two years at least. At autopsy lesions are not specific, but a diagnosis can be made by the demonstration of virus through intracerebral inoculation of mice with brain tissue. The virus is virulent for mice, monkeys, rabbits, guinea pigs, rats and sheep. At least two serologic types of virus are known—Eastern and Western. Generally, the Eastern strain is more pathogenic for man and animals.

found widespread throughout the tissues and subsequently proved virulent for monkeys, rabbits and guinea pigs.

Herpes encephalitis has not been included in the foregoing table since the ability of herpes virus to produce encephalitis in man is in dispute.

Von Economo encephalitis has been omitted from the table because no specific agent has yet been recovered.

SUMMARY

From the large and diverse group of so-called primary encephalitides, nine types have thus far been shown to be due to viruses with a special predilection for the central nervous system. At least six of them appear to be of animal origin and at least three are probably transmitted by insects. Clinical diagnoses can be established readily and practically in all, except rabies and poliomyelitis, by the demonstration of neutralizing and, probably, complement fixing antibodies in the serums of patients. The postmortem diagnosis is best established through isolation and identification of the virus, which, in most instances with the exception of poliomyelitis, are entirely practical procedures.

THE TEMPOROMANDIBULAR JOINT IN RHEUMATOID ARTHRITIS

THEODORE B. BAYLES, M.D.

AND

LESLIE A. RUSSELL, D.M.D.

BOSTON

The dental and medical professions have been interested simultaneously in the patient with rheumatoid arthritis only when a focus of infection in the mouth is thought to have an influence on the patient's systemic disease.¹ However, the treatment of involvement of the temporomandibular joint in rheumatoid arthritis is another condition which requires the intelligent cooperation of the dentist and the physician as involvement occurs in more than one half of patients with this disease. The dentist who encounters patients in his practice with ill defined syndromes of "facial neuralgia" or "stiffness of the jaw" must consider the possibility of these symptoms being early prodromes of rheumatoid arthritis. The physician treating rheumatoid arthritis should understand the anatomy, pathology and treatment and be able to give the proper prognosis in this condition, as the patient with the temporomandibular joint involved is apprehensive and fears eventual complete limitation of motion, as may occur in other joints.

For thirteen years, one of us (L. A. R.) has been attending dentist to an institution devoted to the diagnosis, treatment and outpatient care of the chronic arthritides. During this time we have been particularly interested in the subject of this paper, and we draw our material from long-continued personal observation and care of a large group of patients with rheumatoid arthritis.

In the past, attention has been directed to the temporomandibular joint when it was affected by acute and chronic infections, involving the joint itself or surrounding structures, which might lead to complete limitation of motion. Tumors and trauma may lead to the same end.²

Pathologic processes in the temporomandibular joint resulting from malocclusion may simulate many neurologic and otologic disorders. Costen³ and others⁴ have shown that otic symptoms predominate in patients with edentulous mouths and that symptoms of pain are most common in patients with natural malocclusion or malocclusion from loss of molar support on one side. Each decade produces a greater predisposal to these symptoms as the wear on the natural teeth or loss of them increases wear and tear on the temporomandibular joint. The majority of Costen's patients were over 40. The symptoms or signs referable to the ear resulting from malocclusion are local stuffiness, impaired hearing, herpes, tinnitus and dull pain. Symptoms consisting of headache; pain in a sinus; burning sensation in the throat, tongue and side of the nose; rarely decreased or increased saliva;

herpes of the buccal mucosa, and trismus⁵ have also been described as resulting from malocclusion.

Despite the fact that temporomandibular symptoms and even partial or considerable limitation of motion of this joint occur in persons with rheumatoid arthritis, the subject has received scant attention in dental and medical literature. In 1764 Baron Haller⁶ in *Elementa Physiologiae* described erosion of the cartilage and twenty small bodies (glebulae) in the temporomandibular joint. Kazanjian⁷ has reported 3 cases of bilateral "complete ankylosis" occurring in rheumatoid arthritis. Buchman⁸ recently surveyed the temporomandibular joint from the orthopedic surgeon's point of view and stated that it is not at all uncommon for this joint to be involved in rheumatoid arthritis. He reported 1 case but apparently has had experience with many. Riesner⁹ illustrated faulty temporomandibular articulation by roentgenographic examinations of this joint in 1 patient with rheumatoid arthritis. Aside from these individual reports, the subject has not been considered carefully so far as we are able to ascertain.

The temporomandibular joint is ginglymoarthrodial (hinge-sliding) in character (fig. 1). The head of the condyle of the mandible moves against the glenoid fossa and the articular eminence of the temporal bone. These two joint surfaces are separated by a complete fibrocartilaginous disk, which is a thin oval plate whose

Fig. 1 (from Gray's Anatomy).—Vertical section of temporomandibular articulation.

upper surface is concavoconvex from before backward, to accommodate itself to the mandibular fossa and the articular tubercle, while its under surface, in contact with the condyle, is concave. This disk is attached at its circumference to the articular capsule and with the latter divides the joint space into two separate synovial spaces, the upper being larger and looser. The mandible may be depressed, elevated or carried forward or backward, and a slight amount of side to side motion is permitted. In slight opening of the jaw the lower of the two joints is used. When the mouth is more widely opened, the lower joint still acts on a hinge and the upper joint has a gliding motion, the disk and

condyle sliding forward on to the articular tubercle, and simultaneously the condyle revolves on the disk. In grinding or chewing one condyle and its disk moves forward and the others backward and, in addition, the condyle undergoes vertical rotation on the disk. The joint is supported by the temporomandibular (external lateral) and the sphenomandibular (internal lateral) ligaments, while the stylomandibular ligament is an

Fig. 2.—Plaster collar used to prevent subluxation of the mandible.

important accessory to the joint. The nerves of the temporomandibular joint are the auriculotemporal and masseteric branches of the mandibular nerve.¹⁰ The anatomic features of this joint have been presented in such detail because the presence of the combination of both a sliding hinge motion and a complete interarticular disk differentiates this joint from all others usually involved in rheumatoid arthritis.

The course of the pathologic process in this joint is no different from others involved in rheumatoid arthritis so far as we know. The clinical, roentgenographic or postmortem study is difficult, however, because of its anatomic location. Periarticular edema or thickening or hydrarthrosis can be palpated only with difficulty. Generalized osteoporosis in this disease and superimposition of the joint on the skull make roentgenographic study of less than usual value. Permission for postmortem study is seldom obtained, for esthetic reasons. However, the clinical signs, symptoms and course point to a pathologic sequence similar to that found in other joints. Synovitis is probably the most important primary pathologic change. Then proliferation of the synovium, periarticular edema and hydrarthrosis may follow and produce local pain, tenderness, swelling and irritative phenomena in the supply of nerves to the synovium. The interarticular fibrocartilaginous disk has no nerve supply¹¹ and cannot produce referred pain, but it is intimately associated with the symptoms and eventual prognosis of rheumatoid arthritic involvement of this joint. While it is usual to have limitation of motion subsequent to panus formation and obliteration of the joint cavity, complete limitation of motion, or ankylosis, has not been observed in our series of 515 patients. The writings of others¹² would confirm this fact. We ascribe this to the interposition of the disk. However, in certain persons, when there is a lack of molar support or normal occlusive balance, the disk is perforated or completely destroyed by the upward pull of the masseter muscles on the mandible,⁹ and if this sequence of events occurs before the onset of rheumatoid

arthritis then bony ankylosis can be expected. It is, however, unlikely, as these degenerative changes in the disk usually occur at a time of life late for the onset of rheumatoid arthritis.

Unfortunately the term ankylosis has been widely used to mean both limitation of motion and immobility. We feel that only its correct definition should be retained, and in this paper ankylosis has been used to indicate absolute immobility or complete limitation of motion. Our patients are divided into two groups, those with partial and those with considerable limitation of motion. Partial limitation of motion implies more than 5 mm. of opening power and considerably less than 5 mm. Even our patients with most severe arthritis have shown some motion, however slight. Kazanjian⁷ reported 3 cases of "complete ankylosis" after rheumatoid arthritis, but he defined "complete ankylosis" as less than 5 mm. of opening power. We feel that this precludes actual bony ankylosis, because in other joints this would cause loss of motion.

Limitation of motion of the temporomandibular joint in patients under 15 leads to deformity of the jaw through hypoplasia of the mandible. Hypoplasia has been explained by three factors; first, the diseased joint directly affects an important center of growth in the condyle; second, lack of proper function leads to hypoplasia,⁷ and, third, the dental literature has stressed the effects on mandibular growth of misplaced and unused teeth in the young.¹³

In older patients, rheumatoid arthritis of this joint may lead to subluxation which, when severe, may cause the mandible to recede as much as 1 inch (2.5 cm.). This is probably due basically to intrinsic pathologic changes in the joint itself and to the generalized muscular atony and atrophy associated with the pathologic process. The pull of gravity plays an important part in patients confined to bed, as we have observed subluxation to be most severe in patients kept in the supine position. The integrity of the temporomandibular joint is also threatened by the loss of normal occlusion which

Fig. 3.—The collar as used in the supine position to press against the angle of the mandible.

is brought about by the necessary or unnecessary extraction of teeth.¹⁴ It is well known that the loss of a single tooth can distort the temporomandibular articulation,⁹ and this fact may contribute to subluxation.

In order to clarify the pathologic sequence and clinical observations and coordinate them with the patient's symptoms and proper treatment, persons with rheumatoid arthritis with temporomandibular involvement

may be divided into three groups—those with transitory, acute and chronic arthritis (table 1).

We have found the transitory type of involvement of the temporomandibular joint to be present in 8 per cent of persons with rheumatoid arthritis. It is found in slightly or moderately diseased patients and would

TABLE 1.—*Arthritic Involvement of Temporomandibular Joint: Clinical Summary**

Type of Arthritis	Percentage of Patients with Rheumatoid Arthritis	Degree of Generalized Joint Involvement	Percentage of Patients with Temporomandibular Involvement	Duration	Limitation of Opening of Jaw	Prognosis with Proper Treatment
Transitory	8	Mild or moderate	15.8	1 to 6 days	25 mm. or less	Excellent
Acute.....	20	Moderate to severe	39.2	6 to 10 weeks	Usually 10 mm. or less	Good
Chronic....	23	Severe	45.0	Over 4 months	25 mm. or less	Fair (good with surgical treatment of "burned out" group)
(Total 51%)						

* On the basis of 100 consecutive admissions for rheumatoid arthritis.

be most apt to be seen by the practicing dentist. Opening is limited to about 10 mm. for one to three days. Neuralgic discomfort may be referred to the ear, muscles of the neck, teeth, zygoma, maxilla, mandible, temporal region or occiput or may be limited to the joint itself. These early diffuse symptoms, if unaccompanied by limitation of motion, may be confused with other syndromes of pain in the head and neck.¹⁵ Complete rest of the closed jaw for two to five days with the application of heat at the site of the joint gives relief, and the prognosis is good.

Acute involvement of the temporomandibular joint in rheumatoid arthritis is the most important because on the proper handling of patients with this type of involvement rests the eventual function of the jaw. The acute type of disease occurs in 20 per cent of persons with rheumatoid arthritis. The early symptoms are similar to those previously described in the transitory type but are usually more severe, and eventually the pain becomes localized in the area of the joint anterior to the tragus; then limitation of motion makes the diagnosis obvious. Local pain, warmth and swelling are produced. There can be excruciating pain, and in some cases trigger points comparable to those of tic douloureux are present, usually in the area of the mental foramen. This period lasts from six to ten weeks, and during this time there is limitation of motion usually to less than 10 mm. of opening. Because the patient fears complete ankylosis of the jaw he performs voluntary stretching exercises, which serve only to aggravate the condition by producing severe muscular spasm and pain. The patient should be impressed with the fact that intelligent, conservative treatment in cooperative patients has always led to functional success. Physiologic rest is of paramount importance. The teeth should be in centric occlusion, barely separated, and held that way even while talking or eating. In some, a well rounded liquid diet seems desirable. Local heat over the joint is helpful. The patient must be told the importance of not stretching his jaw to see how he is

progressing. In a surprisingly short period of time, usually a few days, there is decided lessening of the muscular spasm and pain, and mild exercises are indicated. These consist of gum-chewing exercises for an hour or two a day, increasing slowly but always keeping within the limits of fatigue or actual pain. A soft gum is used first, then a harder gum. Finally two or three sticks may be used rather than one. After the larger amount of hard gum can be used for two or three hours without fatigue, a rubber horseshoe cut to fit the shape of the occlusal line is used. This is made of soft sponge rubber $\frac{1}{4}$ inch (0.64 cm.) in thickness. Increasingly firm rubber is used, and the device is kept in the mouth several hours a day. The period of slowly increasing function of the jaw after the acute stage lasts from one to two months, rarely more. A caliper or other measuring device is used to record progress, and the measurements are made between opposing incisors. Until this writing we have always had good functional results, even after successive acute phases, when the regimen described has been carried out. However, it is only fair to say that while a good functional result (opening power of more than 25 mm.) has always been obtained, most of the patients lost a small amount of motion at the upper limit of opening. The following report illustrates treatment of acute involvement of the temporomandibular joint in rheumatoid arthritis.

REPORT OF CASE

Miss G. G., a Jewish woman aged 31, entered the Robert Breck Brigham Hospital on Jan. 23, 1940 with progressive rheumatoid arthritis which had started thirteen months before admission. Elbows, fingers, wrists, knees and ankles were involved at the time of entrance. Despite efforts directed toward improving her general health she had a low grade fever, and the joints remained about the same. Laboratory readings were consistent with the diagnosis of rheumatoid arthritis. During March and the first few days in April she had severe nausea and vomiting and was first seen by us on April 9 after complaining for two days of painful, stiff jaws which had followed a severe attack of vomiting. On this day there was limitation of opening to 18 mm. and a small amount of pain. Rest, massage with chloroform liniment and dry heat (hot water bottle) were started and continued until May 28. The intervening and subsequent measurements of opening power are given in table 2.

TABLE 2.—*Measurements of Opening Power*

Date	Measurement, Mm.
April 23.....	22
April 26.....	23
April 30.....	23
May 5.....	20

May 17.....	27
May 28.....	30
June 4.....	32
June 11.....	34
June 14.....	34
June 21.....	approximately normal

On May 28, because of a decrease in pain, chewing exercises were slowly started and stretching was instituted. On the last examination on June 21 the range of motion was approximately normal and without pain.

The foregoing history is typical of the course of an acute involvement and was apparently started by the trauma inflicted on the joint by an attack of severe vomiting. Trauma is a frequent forerunner of rheumatoid arthritis of the temporomandibular joint, and the condition may be brought about by any strain such as vomiting, natural malocclusion or ill fitting dentures.

When opening of the jaws is limited to less than 25 mm. for more than four months involvement of the patient's temporomandibular joint should be classed as chronic. Chronic partial or considerable limitation of motion of the temporomandibular joint is found in 23 per cent of patients entering hospitals for medical or orthopedic care. These patients may have limitation of motion due either to an "active" arthritic process in the joint or to old dysfunction on the basis of adhesions or damaged joint surfaces. In those patients with a chronic "active" process the treatment with heat, as outlined in consideration of patients with acute involvement, should be carried out and exercises begun cautiously. The larger group of patients with chronic involvement responds moderately well to treatment, and a functional result is usually obtained. We have seen 1 patient in this group who was incompletely treated progress to almost complete limitation of motion. Patients with chronic limitation of motion of a mechanical type are fewer in number, and in these strenuous stretching exercises and forcible wedging have been of value. However, the results are not so satisfactory, and it is necessary to continue the exercises ad infinitum. The presence of firm fibrous adhesions militates against the success of conservative treatment, and it is in patients with this last type of involvement that operative intervention is indicated and is successful. Kazanjian⁷ has described a successful procedure of resecting the neck of the mandibular condyle near its head and inserting a transplant of fascia lata in the area of the resected bone. Function of the temporomandibular joint was improved by this procedure in his cases.

Treatment for subluxation of the mandible is necessary rarely in the acute stage and often in both types of the chronic stage. The patient is sometimes the first to note that his incisors do not meet. Subluxation should be treated by a stay plate similar to that used by orthodontists to lock the upper and lower incisors, but if limitation of motion is already present an open plaster collar (figs. 2 and 3) which rests behind the shoulders of the supine patient and presses against the angle of the mandible is useful. The patient rests in this when in the supine position.

While the ease with which success is obtained by the aforementioned plans of treatment is partially dependent on the unpredictable course of the disease, we feel that careful, intensive, conservative treatment at the transitory, acute and chronic "active" stages of the disease will prevent the serious complication of marked limitation of motion and make late plastic operations unnecessary. This statement is true because of the unusual anatomic relations of the joint (sliding hinge motion and a complete interarticular disk). Thus the temporomandibular joint is differentiated from all others that may be involved in rheumatoid arthritis.

SUMMARY

1. The temporomandibular joint was involved in 51 per cent of 100 consecutive patients with rheumatoid arthritis.
2. Complete limitation of motion (ankylosis) rarely, if ever, occurs in the temporomandibular joint.
3. The unusual anatomic relations of the joint permit a favorable prognosis, and a good functional result may be expected when the outlined treatment is carefully completed.

Clinical Notes, Suggestions and New Instruments

SPECTACLE FRAME HOLDER FOR LEVIN TUBE

HARRY E. ISAACS, M.D.
Attending surgeon, Beth Israel Hospital
NEW YORK

The frequent and increasing use of indwelling gastric and intestinal tubes for gavage, lavage, aspiration and drainage has suggested an improvement in the customary method of holding the catheter near the mouth or nose. The use of adhesive plaster is both unsightly and uncomfortable and often causes skin irritation.

Fig. 1.—Spectacle frame holder for Levin tube.

Fig. 2.—The holder in use.

The rapid extension of the field of gastrointestinal surgery brings the Levin tube, the Miller-Abbott tube and the Wangenstein suction apparatus into daily use in preparatory and post-operative therapy. For the purpose of holding the extranasal or extraoral portion of these tubes, a spectacle frame has been

These frames were made by the Gotham Optical Company, 39 Eldridge Street, New York.

designed and used for the past two years in both the medical and the surgical service. It consists of flexible bows and a bridge which supports on either side of the nose a flexible and adjustable extension terminating in a spring clip. This frame may be comfortably worn over long periods and does not interfere with the use of eye glasses. It has been used recently in the preoperative treatment of a case of esophagospasm in which a Levin tube for feeding and another for irrigation of the dilated esophagus were used simultaneously.

REPEATED AND FATAL CORONARY THROMBOSIS IN A YOUNG MAN

DEAN MACDONALD, M.D., ST. CATHARINES, ONT.

This case is presented because it brings to the fore many questions which form the foundations of a worth while discussion.

REPORT OF CASE

L. G., a youth aged 21, while playing softball was struck on the left side of the chest by the ball at approximately 9:30 p. m. There was no immediate effect. Walking home one hour later, he felt a heavy pressure "in his breastbone." Pain was absent. He usually ate a sandwich before retiring but on this occasion went directly to bed because of slight

Fig. 1.—A, low voltage in leads 2 and 3. Simple tachycardia present. Reversed T wave in lead 3; B, a tracing taken six days later shows changes due to coronary infarction as evidenced by the negative T wave and the ST interval in leads 2 and 3. The voltage of the T wave has decreased considerably.

Fig. 2.—Negative T waves are still present in leads 2 and 3. The voltage of the T wave is increased in all leads.

nausea. Shortly after he went to bed—two hours after the accident—such shortness of breath developed that he was forced to sit on the side of the bed for relief. A few minutes after lying down he had to sit up again, because of dyspnea and also because of severe substernal pain (in the upper third of the chest) which radiated to the left arm and down the inner side to the middle of the forearm. At 12:30 a. m.—three hours after the accident and two hours after the first sign of abnormality—the pain had become so severe that medical advice was sought. The patient's pulse rate was 110 and the pulse was "thin," the temperature was 98.2 F. and the blood pressure 110 systolic and 60 diastolic. Auscultation revealed nothing of note in the precordial area or in the chest posteriorly. The diagnosis would have been definite for an older patient, but his age produced some uncertainty—at least for a general practitioner. (The diagnosis of coronary thrombosis in a boy 21 years old requires more than the average amount of clinical acumen.) Glyceryl trinitrate $\frac{1}{400}$ grain (0.0006 Gm.) was given under the tongue, and within several minutes the severe precordial pain and distress had disappeared, as well as the pain in his arms. This result raised the question of angina, but in my opinion angina is more uncommon in young persons than coronary disease, and so the diagnosis became more clouded than before.

The pain returned in half an hour and, although glyceryl trinitrate and amyl nitrite gave temporary relief, the use of morphine sulfate was necessary. The next day a diagnosis of coronary thrombosis was written on the patient's chart. This

was proved by the electrocardiographic tracings taken on the fifth and eleventh days (fig. 1).¹ The pain in his arm was severe for twenty-four hours, and the sternal pressure lasted four days. Both disappeared gradually, and at the end of eight days all signs and symptoms had disappeared. An uneventful recovery was followed by the patient's obtaining new and easy office work which was permitted by a cardiac consultant. The length of total disability was twelve weeks. An electrocardiogram taken six weeks after the attack is shown in figure 2.

The suggested follow-up was not carried out, and the patient was not seen again until ten months later when he was awakened one morning at 4 o'clock by a substernal pain of moderate severity. (He had had his twenty-second birthday two months previously.) This pain increased in intensity and required three injections each of $\frac{1}{4}$ grain (0.016 Gm.) of morphine sulfate and $\frac{1}{150}$ grain (0.0004 Gm.) of scopolamine hydrobromide. When he awoke—in only two hours—the pain had decreased but was still severe enough for one more injection. By midafternoon all the pain had disappeared. He had a cough and a temperature of 100.4 F. The possibilities of other conditions were considered, only to be discarded. Twelve hours after the attack there was no sign or symptom of cardiac disease, and the patient felt so well that he wanted to go to a dance. He volunteered the information that he did not feel at all as he had after the first attack, not having residual pain, tiredness or difficulty in breathing. The blood pressure was 108 systolic and 64 diastolic, the pulse rate 72 and the pulse of a good quality. However, regardless of these negative physical conditions, his mother was told that he had suffered another attack of heart disease, which carried a relatively poorer prognosis. This was confirmed by the electrocardiographic tracings taken seven days and fourteen days later (fig. 3). He refused to stay in bed longer than two weeks and, without a word to any one, went to his office on Friday afternoon and arranged to return to work the following Monday. On the way home he came into my office, and I have often wondered whether my talk to him initiated the attack which ended so tragically less than thirty-six hours later. I said that unless he did as he was told he would have to take the consequences, which might well be fatal. He had been a restless and difficult patient, and the talk had the desired effect, because his brother reported that he went to bed without saying a word. At 5 a. m. Sunday he was awakened because of unbearable pain in the pit of his stomach (high midepigastrium). This disappeared in a few minutes "of itself," and twice in my presence an attack of excruciating pain was followed by relative freedom. These symptoms resembled those of biliary colic to such an extent that I told his family that there was a distinct possibility of gallstones (having in mind the none too rare cholelithiasis which gives a coronary T wave). This attack was accompanied by a normal pulse rate, a blood pres-

Fig. 3.—A, the T wave in lead 2 is diphasic. The tracing taken seven days later (B) shows changes characteristic of coronary thrombosis. The T wave in lead 2 has become strongly negative and the coronary ST curve has appeared. The T wave in lead 3 also has changed considerably, having a higher voltage.

sure that was the same as when last taken (110 systolic and 60 diastolic), an almost total freedom from pain between attacks, no difficulty in breathing, a temperature of 97.6 F., moderate sweating and a facial appearance of extreme pain. Indeed, colicky and penetrating pain in the upper midepigastrium was the only complaint. The absence of pain between attacks was most striking. The pain, on returning, started

1. The electrocardiograms were interpreted by Dr. C. L. Anderson.

slowly and reached an apex in about two minutes, remained unbearable for several minutes and disappeared quickly.

One-half grain (0.03 Gm.) of morphine sulfate was given and in fifteen minutes $\frac{1}{4}$ grain (0.016 Gm.) more; $\frac{1}{100}$ grain (0.0006 Gm.) of scopolamine hydrobromide was added. This was repeated in twenty minutes. The total dose was 1 grain

There were a few fatty plaques in the ascending aorta, but the mouths of the coronary arteries were normal.

Microscopic Examination.—Right Coronary Artery (fig. 4 B): Sections of this vessel at and adjacent to the site of occlusion showed an extreme degree of atherosclerosis. At the site of occlusion there was a large degenerating atheromatous plaque which had greatly reduced the size of the lumen of the vessel. Deposited on this plaque was fresh thrombus material which together with the atheroma had resulted in complete occlusion of the vessel. Immediately distal to the thrombus the lumen was reduced to a mere slit by an extremely large, degenerating atheromatous plaque.

Left Coronary Artery (fig. 4 A): Sections of this vessel showed only a small lumen because of the encroachment on it by a completely organized thrombus with recanalization in its depths. The tunica media, the tunica adventitia and the periadventitial tissues of the coronary vessels were normal.

Heart (figs. 5 and 6): Sections from the anterior wall of the left ventricle and from the anterior portion of the interventricular septum showed large areas of replacement of muscle fibers by fibrous tissue, the picture being that of healed infarction. Sections from the posterior wall of the left ventricle confirmed the presence of a recent infarct. This was evidenced by swelling and loss of cross striations of the muscle fibers in this area. In all sections the intramyocardial blood vessels were normal.

Aorta: Sections from the ascending aorta showed no abnormality apart from a few fatty plaques.

The anatomic diagnosis was (1) atherosclerosis of the coronary arteries; (2) stenosis of the coronary arteries; (3) thrombosis of the coronary arteries (old thrombosis of the left with recanalization and recent thrombosis of the right artery), and (4) infarcts of the heart (healed and recent).

COMMENT

In this case the severe pain resulting from a large myocardial infarct (fig. 5) during the first attack was relieved by a vasodilator as is the pain of angina. What is the relationship? To what degree did the extra supply of blood to the myocardium—which theoretically resulted from the vasodilators—relieve the pain of the pathologically proved ischemia, or was the

Fig. 4.—A, left coronary artery (stained with hematoxylin and eosin), showing organized thrombus with recanalization. Note the small functional lumen ($\times 15$). B, right coronary artery. There is a large atheromatous plaque with fresh thrombus material completely occluding the lumen. (The small slit at the top is an artefact.)

(0.065 Gm.) of morphine and $\frac{1}{100}$ grain (0.0013 Gm.) of scopolamine hydrobromide, which produced sleep for only three hours. On his awakening the pain was slight. During this time the pulse rate remained the same and there was no evidence of respiratory distress. Abdominal examination gave negative results. The patient fell asleep shortly and died without warning in his sleep one hour later.

PATHOLOGIC REPORT

The specimen consisted of a formaldehyde-fixed unopened heart from which the pericardial sac had been removed. The heart weighed 330 Gm. and appeared slightly enlarged on external examination. The chambers and appendages were of the usual size and free from thrombi. The foramen ovale was closed. The measurements of the orifices of the cardiac valves were tricuspid 14 cm., pulmonary 7.5 cm., mitral 10 cm. and aortic 7 cm. The left coronary artery immediately proximal to its point of bifurcation showed an advanced degree of stenosis, but it was not possible to say on gross examination whether this was due to a large atheromatous plaque or to an organized and recanalized thrombus. The anterior descending and circumflex branches of this vessel contained no large atheromatous plaques, but the walls appeared slightly thickened, and they were smaller than usual. The right coronary artery at a point beginning 2.5 cm. from its origin showed complete occlusion by a large atheromatous plaque on which had been deposited fresh thrombus material. From that site the occlusion extended for a distance of 2 cm. distally. The rest of this vessel and its branches were normal except for a few small atheromatous plaques. There was a healed infarct involving the lateral wall of the left ventricle and extending into the anterior portion of the interventricular septum toward the apex. This measured about 3 cm. in diameter. In the anterior portion of the septum extending up toward the base there were a few patches of confluent fibrosis. There was a diffuse change in color involving the posterior wall of the left ventricle and the adjacent portion of the interventricular septum. This was suggestive of recent infarction, although the myocardium underlying this area exhibited no palpable softening. The myocardium of the left ventricle measured 19 mm. and that of the right ventricle 5 mm. in thickness.

Fig. 5.—Old infarct (stained with hematoxylin and eosin). There is almost complete replacement fibrosis. A small amount of muscle is seen at the bottom and at either side of the section. Reduced from a photomicrograph with a magnification of 50 diameters.

relief a coincidence, and would it have occurred—as it did in the fatal attack—without drugs? Did the worry resulting from the talk in the office contribute to the fatal attack? Could the final attack have been caused by gallstones which produced pain severe enough to cause reflex ventricular fibrillation in a damaged heart? Does this ever occur clinically? What is the explanation of so colicky a pain?

Did this patient have symptoms in the second attack because the lumens of the coronary vessels were too small to satisfy the demands of so much muscle? Could the first attack have been precipitated by, aggravated by or in any way related to the injury to the chest? How many cases of coronary disease in younger people are diagnosed as indigestion—as this attack would have been if the pain had been less severe? As a student I was taught that coronary thrombosis carries a hopeless prognosis—a fatal outcome in relatively few years. This is now known to be wrong. Could it not be that present conceptions of coronary disorders in young people will also change during the next few years and that the mistaken diagnosis of indigestion will become much less common? Might not a young person have pathologic conditions of the heart without showing symptoms because of the greater reserve in young hearts?

SUMMARY

Proved coronary thrombosis occurred in a youth aged 21 years. The case was instructive because the condition was repeated twice and proved fatal when the patient was 22 years of age. The pain was relieved by vasodilators and the pain of the third attack was indistinguishable from that of cholelithiasis; such a condition should always be considered, even in young persons. The law of averages may prove that coronary thrombosis is not common under the ages of 30 to 35

Fig. 6.—Old infarct (stained with Mallory's connective tissue stain). A few bands of heart muscle are present in the midportion. The rest is scar tissue. Reduced from a photomicrograph with a magnification of 50 diameters.

years, but this does not prove that it cannot occur. I have had intimate knowledge of this condition because at the age of 29 I was a victim, as determined by the present reliable clinical and laboratory criteria, and I know of 3 other cases, 1 of which was fatal, occurring in the twenties.

110 James Street.

PENETRATION OF TISSUE BY DIESEL OIL UNDER PRESSURE

JOHN E. HUGHES, M.D., SHAWNEE, OKLA.

The rapidly increasing use of high pressure appliances in industry, in which oil or grease under 4,000 to 7,000 pounds pressure is forced through small caliber openings generating an energy when misdirected, will undoubtedly result in severe tissue damage, often resulting in necessity for amputation of fingers or other parts affected.

Two cases have been reported in THE JOURNAL,¹ both resulting in amputation: one a result of Diesel oil, the other from a grease gun commonly used in garages to force grease and oil laden graphite into spring shackles and other friction parts. This modern appliance is a far cry from the hand grease gun and screw grease cup in common use a few years ago.

1. Rees, C. E.: Penetration of Tissue by Fuel Oil Under High Pressure from Diesel Engine, J. A. M. A. 109:866 (Sept. 11) 1937. Smith, F. H.: Penetration of Tissue by Grease Under Pressure of 7,000 Pounds, *ibid.* 112:907 (March 11) 1939.

The Diesel engine, generally used in small maritime vessels, is rapidly becoming the power engine in many diversified industries. In the oil fields the Diesel oil used is of low viscosity and highly volatile, approaching the consistency of kero-

Fig. 1.—Hand three days after injury and just prior to amputation. Moist gangrene of middle and ring fingers with separation of epidermis. Maceration of remainder of hand due to wet dressings.

sene. A jet of this oil as ejected from the nozzle under 5,000 pounds pressure, with a muzzle velocity of a rifle, is capable of severe damage to tissue when contact or near contact to the nozzle is provided.

REPORT OF CASE

F. M., aged 31, an oil field worker, while cleaning the nozzle of a Diesel engine, had his left palm in contact or nearly in contact with the nozzle when his helper tripped the compressor. The nozzle has five pin point openings, each opening one ten thousandth of an inch in diameter. Numbness in the hand was immediately experienced, and he observed three little drops of blood coming from the three pin point openings on the volar surface at the base of the left middle and ring fingers. Numbness was soon followed by severe pain in the hand. I saw him six hours after the injury suffering intense pain, which was only partially relieved by morphine. His hand was slightly

Fig. 2.—Discoloration of nail of middle finger and separation of epidermis.

swollen, and the three pin point openings looked trivial. He was admitted to the hospital two hours later, where additional morphine was given for relief of pain and the hand was elevated and placed in a hot wet boric pack. He continued to require morphine for relief of pain, and on the third day

it was noticed that the finger nail bed of the left middle finger was dark and that the epidermis of the palmar surface had loosened. The underlying structures were dark red. Multiple incisions were made in the hope of relieving tension in the tissues. These did not bleed. The following morning an amputation was done of the middle and ring fingers; the latter had also become gangrenous. The fingers were amputated at the metacarpophalangeal joint. There was not sufficient flap to suture and the wound was left open. Pain in the hand was immediately relieved, and the temperature of 100 to 103 F., which had existed since the morning of the injury, dropped to normal. After four weeks the wound has nearly healed, and the patient will have almost a perfect result in the rest of the hand.

COMMENT

What is the cause of the gangrene in these cases? The wound as far as the external surface appears most trivial. The amount of Diesel oil, possibly, 2 to 3 cc. forced into the tissue, would not appear to be bulky or toxic enough to produce circulatory strangulation. Or is it the sudden volatilization of this jet of oil under tremendous pressure sufficient to produce a massive thrombosis of the blood vessels? The almost immediate onset of pain and its continuation regardless of heavy doses of morphine might suggest the latter view.

14 East Ninth Street.

Council on Foods and Nutrition

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT.
FRANKLIN C. BING, Secretary.

NUTRITIONALLY IMPROVED OR ENRICHED FLOUR AND BREAD

Wheat in its various forms contributes 25 per cent or more of the average daily caloric intake of persons residing in the United States. The nutritive value of wheat and its products has been discussed for more than one hundred years. Sylvester Graham, in the early part of the nineteenth century, stressed the healthful properties of whole wheat as compared with the more refined products, but scientific evidence in support of his contentions was not forthcoming until after the beginning of what may be called the "vitamin era" in nutrition. In 1916 McCollum and his co-workers¹ called attention to the high content of the antineuritic factor, then called "water-soluble B," in wheat germ, and in 1919 Osborne and Mendel² reported their classic study of the nutritive value of the wheat kernel and its milling products, a project undertaken during the first World War. The latter investigators estimated that the wheat kernel consists of about 83.5 per cent endosperm (the white, starchy portion of the grain), 1.5 per cent embryo or germ (the growth center of the grain) and about 15.0 per cent bran (including some inner seed coats). They showed that the embryo was indeed rich in the antineuritic factor, but that some was also present in the bran and even small amounts in the endosperm. They also discussed various aspects of the question to what extent should wheat be milled? Their article left no doubt that the question needed further experimental study, but, after the war, general scientific interest in the nutritional problem presented by the milling of wheat tended to diminish. However, in 1922 Bell and Mendel³ undertook some further studies on the distribution of the antineuritic vitamin, then known as vitamin B and now identified as thiamine, in the wheat kernel. Their studies gave clear indication that, while the wheat embryo is rich in this vitamin, it accounts for only about 15 per cent of the total vitamin B₁

content of the grain because of the small proportion of embryo in the wheat kernel. Wheat from which the embryo has been removed by dissection still contains much of the vitamin B₁. Patent (white) flour, representing from 60 to 70 per cent of the entire grain, contains only 10 per cent or less of its total vitamin B₁ content. Thus, the use of refined white flour rather than whole wheat flour represents the substitution of a food extremely low in vitamin B₁ for a food that is a good source of this dietary essential. Many additional studies corroborate this view and have shown, further, that other essential dietary components, vitamins and minerals, are also more concentrated in the parts of the grain removed in the milling of wheat for the preparation of flour.

COMPOSITION OF WHEAT, WHOLE WHEAT FLOUR AND WHITE FLOUR

There now are available many reports of the vitamin B₁ (thiamine) content of the wheat grain. These reports have shown that the thiamine content is somewhat variable, depending on a number of factors such as locality, soil and weather conditions during the growing season. There seems to be a real difference between the thiamine contents of hard and soft wheats. According to the figures of Booher and Hartzler,⁴ which are in harmony with other data reported in the literature, soft wheat contains about 118 international units of vitamin B₁ to each hundred grams; hard winter wheat contains about 159 and hard spring wheat about 175 international units of vitamin B₁ to each hundred grams.

Other components of the wheat grain which have been given consideration in recent discussions of the nutritive values of flour are calcium, phosphorus, iron, riboflavin and nicotinic acid. Whole wheat flour may be considered an excellent source of at least two of these factors, phosphorus and iron. It also provides important amounts of riboflavin and nicotinic acid.

Although the data on the quantities of riboflavin and nicotinic acid in wheat are not extensive, an attempt has been made to provide in tables 1 and 2 the composition of average whole wheat flour and white patent flour with respect to these and other dietary essentials under discussion. In table 1 the values are reported in terms of milligrams of the various constituents to the pound. For purposes of reference, these values are reported in table 2 in terms of milligrams per hundred grams. The vitamin values listed in each table also are reported in terms of the conventional biologic units. Data regarding the composition of flour enriched according to the definition and standard proposed by the U. S. Food and Drug Administration⁵ and in principle endorsed by the Committee on Food and Nutrition of the Division of Medical Sciences of the National Research Council and by the Council on Foods and Nutrition of the American Medical Association also are included in the tables. The tables show that whole wheat flour contains about 150 and white flour only about 17 international units of vitamin B₁ to each hundred grams. Riboflavin is present in whole wheat to the extent of about 83 Sherman-Bourquin units and in white flour to the extent of about 13 units to each hundred grams, calculations being made on the basis that 3 micrograms (0.003 mg.) of riboflavin are equivalent to 1 Sherman-Bourquin unit. There is some recent evidence that the nicotinic acid content of wheat and its milling products may be greater than is indicated in the table.

Thiamine is the component which makes whole wheat most significant in the diet at the present time. This is emphasized by the reports of Baker, Wright and Drummond,⁶ discussed by Cowgill⁷ in his review of "The Need for the Addition of Vitamin B₁ to Staple American Foods." These reports show that the parish poor of England in 1839, according to records of foods which they were given, probably received about 650 to 850 international units of vitamin B₁ daily, whereas supposedly

good diets of persons in moderate circumstances in England in 1939 supplied only about 450 to 550 international units of vitamin B₁. Stiebeling and her associates⁸ have shown that the vitamin B₁ intake of contemporary families with liberal food allowances in the United States is not more than from 460 to 740 international units "per man per day," and that persons in the lowest income groups obtain an average of only 280 to 330 international units. This decided reduction in the

vitamin B₁ intake must be attributed to the prevailing use of refined sugar and highly milled wheat products, principally white flour, in the twentieth century as compared to the less refined flour used in the early nineteenth century. Jolliffe⁹ has pointed out that the average American diet of today provides about the same number of calories in the form of sugar and white flour as were provided in the form of less refined flour by the average diet of the past. In each instance the calories so provided constituted approximately half of all the calories. This half, which formerly came mostly in a coarse flour representing a good source of thiamine and containing important amounts of other vitamins as well as minerals, has later been replaced about equally by refined sugar and white patent flour.

Despite the greater consumption of fresh fruits and vegetables and other so-called protective foods, it has not been possible to make up the loss of thiamine which results from the substitution of sugar and white flour for the old time stone-ground flour. This is because the other foods, important as they are for other reasons, are relatively poor sources of thiamine as compared with whole wheat. Although whole wheat is an excellent dietary source of iron and a good source of riboflavin and nicotinic acid, the known differences between whole wheat and white flour with regard to calcium, phosphorus, iron, riboflavin and nicotinic acid are less important than the differences in thiamine. This is because other foods are available which are excellent sources of one or more of the former group of dietary essentials. Thus milk is an outstanding source of calcium, phosphorus and riboflavin. Meats are important sources of nicotinic acid and riboflavin, and iron is supplied in small amounts by many foods.

COMPOSITION OF NUTRITIONALLY IMPROVED FLOURS AND BREAD

On the basis of the foregoing statements, it is apparent that any steps to improve the nutritional value of American diets should include restoring to wheat milling products the high nutritive value of the whole wheat grain with particular reference to thiamine. Such action would be in harmony with the principles established by the Council on previous occasions, namely (1) in the processing of foods, every effort should be directed to retaining in the products the food values of the natural foods from which they are made; (2) for those processed foods which are not nutritionally equivalent to the original foods from which they have been made, it is in the interest of the public to restore certain dietary essentials so that these

processed foods have the full nutritive value of the natural foods, with respect to the substances added.

There now are available two methods by which the thiamine and other nutritive values of wheat may be restored. These are (1) the use of special milling processes which retain the major portion of the vitamin and mineral content of the grain with a minimum of coarse fiber derived from the outer branny coats and (2) the addition of crystalline vitamin preparations and mineral salts. When concentrated vitamin preparations or mineral salts, or both, are added to processed foods such as flour it is essential first that the substances added should be those for which a greater distribution is in the interests of public health, and, further, that the processed foods should be a suitable vehicle for the added minerals and vitamins. The added substances should mix well with the food and not lose potency during the usual conditions of storage. They also must be in a form which is biologically available to the consumer and which does not adversely affect the other nutritional values of the product. The materials used for the aging and bleaching of flour, namely nitrogen peroxide, benzoyl peroxide, nitrogen trichloride and chlorine (or chlorine containing small amounts of tritosyl chloride) in the amounts added, are reported not to have a deleterious effect on the vitamins and minerals under consideration.

Substances which can be advantageously added to white flour and which are now available in suitable form are thiamine, riboflavin, nicotinic acid and salts of iron, calcium and phosphorus. The aim in adding these dietary essentials to processed foods such as flour is to provide dietary essentials which people must get from foods in order to maintain good nutrition and health. The restored cereals simply offer another source of these dietary essentials. They may make it easier for the person unskilled or unversed in nutrition to obtain the vitamins and minerals which he should have in his food. The principle of restoration to high natural levels, which has been sponsored by the Council, means essentially fortification with a limit, that limit being the content of the natural or unprocessed foods. That this principle has merit is conceded by many authorities in nutrition, who agree that by proper selection of natural foods one can readily obtain an adequate amount of all the dietary essentials. The restoration program also fits admirably into the educational program of nutritionists and others concerned with teaching the public to recognize certain classes of foods as contributors of certain necessary components of the diet.

According to this plan white flour would have to have added to it calcium, phosphorus, iron, thiamine, riboflavin and nico-

tinic acid in order to bring it up to the levels of whole wheat as shown in table 1. Of these dietary essentials the most important, so far as American food habits are concerned, are thiamine and iron. The other essentials supplied by whole grain cereals furnish "plus values," although under certain circumstances, when meat and milk are not readily available, some of them, notably riboflavin, nicotinic acid and calcium, may assume greater importance.

From the beginning of its considerations the Council has recognized that even whole wheat is but a minor source of calcium in the diet. It was therefore decided that, if calcium

8. Stiebeling, Hazel K., and Phipard, Esther F.: Diets of Families of Employed Wage Earners and Clerical Workers in Cities. Circular 507, United States Department of Agriculture, Bureau of Home Economics, 1939.

9. Jolliffe, Norman: A Clinical Evaluation of the Adequacy of Vitamin B₁ in the American Diet. Internat. Clin. 4: 46 (Dec.) 1938.

is to be added to white flour, it would be well not to stop at the level of the whole grain but to add an amount which is really significant from the nutritional point of view. If adult requirements for calcium are in the neighborhood of 0.7 Gm. daily and if the caloric requirements of a moderately active man are approximately 3,000 calories, then each hundred calories of food will do its share in meeting the calcium requirements if it provides 23 mg. of calcium. One hundred Gm. of whole wheat flour provides 350 calories, but only 53 mg. of calcium. If fortification is made to some simple multiple of the total calcium requirement, the figure 3 being considered reasonable, then improved white flour might have a calcium content equal to 75 mg. per hundred calories, equivalent to about 265 mg. per hundred grams, or about 1.2 Gm. per pound.

With the calcium brought up to this level, there is no reason why phosphorus should not be permitted to be present in equal amounts, or at least in amounts which would provide, in the fortified product, a calcium-phosphorus ratio which is considered desirable. This latter consideration is of little practical importance, however, because it is the ratio of calcium and phosphorus in the diet as a whole which is of importance to the organism, not the ratio which may occur in any single constituent.

It is of interest to note that other points of view regarding the basis for the restorative addition of vitamins to white flour lead essentially to the same results as those proposed by the Council. With regard to thiamine, it is known that this factor is concerned with the oxidation of carbohydrates. It has been estimated that approximately 25 international units of thiamine are necessary for the oxidation of 100 calories from carbohydrate. On this basis 100 Gm. of white flour, which yields approximately 350 calories, would require 87.5 international units of thiamine for its metabolism, or slightly more than half of the amount of thiamine present in an equal weight of whole wheat flour. However, in view of the well known dietary deficiencies of granulated cane or beet sugar, which now contributes to the American diet almost as many calories as does flour, the suggestion is made that thiamine should be added to flour in quantities sufficient to provide not only for itself but for the calories of sugar as well. On this basis, if flour is to provide the thiamine necessary to metabolize its own carbohydrate content as well as the carbohydrate derived from sugar, it must be enriched to the level of approximately 175 international units per hundred grams, equivalent to 2.38 mg. per pound. This figure is only slightly higher than the average thiamine content of mixed whole wheat and less than has been reported for many individual samples.

Similar conclusions may be reached if the problem is considered from the point of view of the amount of thiamine and other dietary essentials which should be furnished by the quantity of flour usually eaten in one day. It has been estimated that the average daily intake of wheat flour is in the neighborhood of 6½ ounces, equivalent to about 650 calories. If it is assumed that a desirable intake of thiamine for a person who needs 3,000 calories is in the neighborhood of 500 units, then each calory should be accompanied by approximately 0.166 international unit, and 6½ ounces of flour should have 108 international units. The average daily consumption of sugar is said to be about 565 calories, which, according to these views, should be accompanied by about 94 international units of thiamine. On this basis, if flour is to provide for its own thiamine needs plus those of sugar, 6½ ounces of flour should provide not less than 202 international units of thiamine, equivalent to 500 international units, or 1.66 mg. per pound.

At hearings called in Washington in the fall of 1940 to consider proposals for the new definitions and standards for white flour and related products, the following view was presented: If a product such as white flour is to be nutritionally improved, then the dietary essentials added to it should be only those which are stable under usual conditions of storage and handling of flour, and only those substances which are essential in the diet should be added. The amounts added ought to be commensurate with the dietary requirements. If flour makes up about one fourth of the daily caloric intake, then that flour may well provide a minimum of one fourth of the daily require-

ment of the dietary essentials to be added. A convenient maximum figure would be four times this lower level. Appropriate additions to white flour, according to these views, would be vitamins A, B₁, D, riboflavin and nicotinic acid and the minerals calcium, phosphorus and iron. Evidence now available does not justify additions of pantothenic acid, vitamin E, vitamin B₆ or substances other than those enumerated. A nutritionally improved flour prepared in accordance with this standard would have, in each pound, the following minimum and maximum composition with respect to the minerals and vitamins named: minimum, 496 mg. of calcium, 496 mg. of phosphorus, 6.15 mg. of iron, 0.48 mg. of thiamine, 1.23 mg. of riboflavin, 6.15 mg. of nicotinic acid and 250 U. S. P. units of vitamin D; maximum, 1,980 mg. of calcium, 1,980 mg. of phosphorus, 24.8 mg. of iron, 1.92 mg. of thiamine, 4.92 mg. of riboflavin, 24.8 mg. of nicotinic acid and 1,000 U. S. P. units of vitamin D. There would appear to be no good reason for adding more than the maximum quantities proposed.

It is interesting that with the exception of vitamin D the standards set up by the Council comply with either the minimum or maximum values suggested at these hearings. In the case of vitamin D it has been the considered opinion of the Council that fortification of cereal products with vitamin D is not desirable in the light of evidence heretofore available. There is but little evidence that adults, with the exception of pregnant women, need this vitamin in amounts greater than are ordinarily obtained from foods and the vitamin D effects that are derived from exposure to direct sunlight. However, newer evidence has been obtained that vitamin D may be of importance because of its favorable effect on the utilization of the phosphorus of cereals. Further, if calcium salts in significant amounts are added to cereal products it may be well to add vitamin D also. These points are sufficient to indicate the complexity of the problem, which is being studied further by the Council and which will be the subject of a future report.

The question of the nutritional improvement of white flour also was given early consideration by the Committee on Food and Nutrition of the National Research Council. Like other groups who have considered the problem, this committee approved discriminate fortification of flour. The standards for enriched flour which it endorsed and which essentially have been adopted by the Food and Drug Administration (table 1) are not dissimilar from those adopted by the Council on Foods and Nutrition of the American Medical Association and were approved by the Council at a meeting in Chicago, Nov. 18, 1940.

COUNCIL STANDARDS FOR NUTRITIONALLY IMPROVED FLOUR AND PRACTICAL METHODS OF ATTAINING THEM

The Council is ready to accept nutritionally improved flour preparations which have been formulated according to policies developed in this report and which have a nutritive value equal at least to that represented by the minimum standards for enriched flour proposed by the U. S. Food and Drug Administration, provided the product also complies with the rules of the Council.

A number of suitable preparations now are available for use in improving the nutritive value of flour. Calcium and phosphorus in the form of their various salts may be added to foods. Such additions present no problem, except that it may be important to call attention to the necessity of using products that are relatively free from fluorine and lead. Unpublished evidence provided by members of the milling industry indicates that the addition of salts of iron in amounts required to meet the standards adopted for enriched flour does not present any unsurmountable difficulties with regard to the keeping quality or the stability of the vitamins in the mixture or in the taste of the product if a suitable form of iron is used. Iron phytate, sodium ferric pyrophosphate and ferrum reductum have been employed, but the Council is reserving judgment on the best iron salt to be added until further information is collected about the availability of the iron in these preparations. Obviously there is no nutritional advantage in adding an iron compound if the iron is not available to the body or if the iron has a damaging effect on other constituents of the flour.

Nicotinic acid can be added as such or in the form of its amide, the latter probably being the preferable form. While

no difficulties have arisen with small physiologic amounts of nicotinic acid such as may be present in whole wheat, yet the uncomfortable flushing caused in some persons by therapeutic doses of nicotinic acid indicates the desirability of using the amide, which does not produce untoward reactions. Riboflavin may be added in the form of the pure preparation isolated from natural sources or as a synthetic product. Thiamine may be added in the form of thiamine hydrochloride, which is commercially available as a synthetic product that meets U. S. P. specifications.

Another means of increasing the thiamine, riboflavin and nicotinic acid content of flour is by the addition of natural substances rich in these essentials. Thus dried yeast may be used as a source of all three vitamins. A dried extract of a riboflavin concentrate derived from biologically activated grain, by bacteriologic methods, is available as a source of riboflavin. Wheat germ is a source of thiamine, although the use of this product has natural limitations because several times the amount of germ present in the grain must be added to white flour in order to give the full vitamin B₁ value to the flour so fortified, and the baking qualities of the flour are said to be affected by the use of too large proportions of wheat germ.

Whole wheat itself is one of the best natural sources of these vitamins, and one important method of obtaining a flour of higher vitamin content is to include a larger portion of the grain by special milling processes. At least two methods are in commercial operation in the United States. One such method yields a white flour which contains the major portion of the germ so finely ground that it is indistinguishable to the naked eye from ordinary white flour. Another likewise involves the incorporation of more of the germ and aleurone layers of the grain in the finished product.

Information concerning the composition of a number of nutritionally improved flour preparations manufactured by special milling processes has been made available to the Council and is shown in table 3. Germako and Vito Wheat Product are flour preparations which represent from about 85 to 95 per cent of the wheat kernel. Melior and Vibic flours also contain a large proportion of the whole grain. In addition there has been added to Vibic flour sufficient calcium, iron and riboflavin to restore its content of these dietary essentials to the high levels natural to whole wheat. All these flours produce breads of similar texture but of darker color than those made with

TABLE 3.—Composition of Some Nutritionally Improved Flour Preparations Prepared by Special Milling Processes

These products may meet the nutritional requirements for enriched flour by the addition of smaller quantities of vitamins and minerals than it is necessary to add to white flour.

white patent flour. The flavor also is somewhat different but is considered highly agreeable by many persons.

Flour prepared by the process developed by Morris Mills, Inc., retains the major portion of the wheat germ but little or none of the outer coats. It is white and has baking qualities very similar to those of the customary patent flour. Its thiamine content is greater than that of white patent flour but less than that of whole wheat or of products restored to the level of whole wheat.

Brands of white flour enriched with crystalline vitamin preparations and mineral salts which conform to the definition and standard for "enriched flour" promulgated by the Food and

Drug Administration⁵ are rapidly being made available both for use by commercial bakeries and for sale by retail grocers. The majority of these flours are patent flours to which has been added sufficient crystalline thiamine hydrochloride, riboflavin, nicotinic acid and iron to comply with the minimum legal standard for enriched flour.

The Need for Standards for Bread.—It is expected that within a year hearings will be held for the purpose of developing a definition and standard for bread in accordance with the provision of the Food, Drug and Cosmetic Act. This is urgently needed not only for the protection of the consumer but for the

TABLE 4.—Suggested Standards for Enriched Bread

* Optional.

guidance of the baking industry. Bread enriched with important dietary essentials found in whole wheat can now be marketed if properly and informatively labeled.

Approximately 50 per cent of the flour consumed in the United States is made into bread by commercial bakeries. It has been shown that the baking of bread results in a loss of not more than from 10 to 15 per cent of the thiamine originally present in the flour, such loss as does occur being in the crust. This is largely because the temperature within the interior of the loaf does not exceed that of boiling water. The loss of thiamine in other baked goods or other products made from flour has not been studied in detail, but it may be considerable. The Committee on Food and Nutrition of the Division of Medical Sciences of the National Research Council has endorsed standards for enriched bread which shall contain at least two thirds of the quantities of the nutritional essentials of enriched flour to the pound, less 15 per cent of the thiamine due to loss in baking. Details of the proposed standards are shown in table 4. There should be no difficulty in attaining these standards if the flour used in the baking of bread has the nutritive value of the nutritionally enriched flour.

The fact that yeast is added to the dough as a leavening ingredient affords another possibility for improving the thiamine content of bread. Ordinary white bread contains about 50 international units of vitamin B₁ to a pound loaf—occasionally 100 units to the loaf. Whole wheat bread contains about 450 or more international units to the pound loaf. It is possible to produce a white bread containing approximately 450 international units to the pound loaf by using no more than the customary amounts of yeast (2 per cent, based on the weight of the flour used) if the yeast is a product sufficiently high in thiamine. Suitable products now are available commercially not only for the purpose of increasing the vitamin B₁ content of bread but for supplying nicotinic acid, iron and some riboflavin and other factors as well. Free¹⁰ has reported that with the use of moderate amounts (an average of four or five slices daily) of bread made with yeast high in thiamine the total thiamine intake of normal young women of college age was raised to from 0.74 mg. to 1.4 mg. daily. It was estimated that the special bread contributed about 34 per cent of the total thiamine intake.

SIGNIFICANCE OF NUTRITIONALLY IMPROVED FLOURS IN THE DIETS OF ADULTS

It is apparent from the foregoing discussion and from the figures provided in the tables that nutritionally improved flours and breads made in accordance with the standards discussed will make possible a marked improvement in the diet. Flours made in accordance with the principles adopted by the Council may have the full nutritional value of whole wheat flour with respect to thiamine and such other important dietary essentials

10. Free, A. H.: Increase of Vitamin B₁ Intake By the Use of Special High Vitamin B₁ Bread, *Cereal Chemistry* 17: 725 (Nov.) 1940.

as have been added. These improved flours make it possible to have much of the nutritional advantages of whole wheat. They do not fully take the place of whole wheat unless prepared by special milling processes, nor do they minimize in any respect the necessity of extending educational efforts directed to the guidance of the public in the selection of adequate diets.

Adult Diets.—It has been shown by the dietary surveys referred to earlier in this report⁸ that the adequacy of the diet in vitamin B₁ in different sections of the United States may depend to a large extent on the amount of money which can be spent for food. Families living in Southern cities whose weekly food expenditures ranged from \$0.63 to \$1.24 for each person obtained diets containing from about 280 to 330 international units of vitamin B₁, based on an estimate of the vitamin content of the raw foods. At higher levels of expenditure for food the estimated average vitamin B₁ content of the diets of different regional groups increased gradually but it was not until weekly food expenditures reached as much as \$2.50 to \$3.12 per person that most families obtained diets averaging more than 500 international units per person daily. (In this instance the "person" is considered to be a man of moderate activity who requires in the neighborhood of 3,000 calories a day.) Family food supplies costing more than \$3.12 a person a week averaged from 460 to 740 international units per person daily.

It is generally agreed that about 333 international units of thiamine is the minimum intake which will prevent beriberi, and newer evidence indicates that more than this is required to prevent milder symptoms of thiamine deficiency. Also more is required by men of unusually large stature, particularly if engaged in occupations requiring an unusual degree of physical activity. Various opinions have been advanced as to the probable intake which will be satisfactory for adequate nutrition and for the prevention of subclinical states of thiamine deficiency. Until recently it has been considered that an allowance of about 500 international units daily, equivalent to about 1.66 mg. of thiamine, provided a liberal standard for the adult man of moderate activity. Recent studies by Williams and his associates¹¹ on the effect of induced thiamine deficiency in man indicate that an intake of 2 mg. of thiamine daily, equivalent to 666 international units, may be needed by an active adult man.

Diets which are considered adequate in all of the known dietary essentials can be selected from a wide variety of foods and at various levels of cost. However, it has been the experience of all persons who attempt to plan nutritionally adequate diets at low levels of cost that a relatively large proportion of cereal products, which are relatively inexpensive, must be included and that smaller amounts of the more expensive "protective" foods can be used. For this reason it is important that the cereal products used in low cost diets be of high nutritional value. In the plans developed by Carpenter and Stiebeling¹² for adequate diets at four different levels of cost the weekly allowances of flour and cereals for the moderately active man of average weight are 5 pounds 4 ounces for a restricted diet for emergency use, 4 pounds 8 ounces for an adequate, or "good," diet at minimum cost, 4 pounds for an adequate diet at moderate cost, and 2 pounds 4 ounces for a liberal diet. This is not more than is customarily used by many families in the respective income groups and may be considerably less than is consumed in many low-income families.

The importance of whole grain cereals, particularly in low cost diets in which cereal products are used to replace some of the more expensive "protective" foods, may be illustrated by the fact that in the proposed restricted diet for emergency use the use of all whole grain cereals, represented by whole wheat, instead of all refined cereals, represented by white flour, would result in an increase of about 456 international units, equivalent to 1.37 mg. of thiamine per man daily. In the "good" diet at low cost such substitution would result in

an increase of about 390 international units, or about 1.17 mg., of thiamine for each man daily, and even in the liberal diet the use of whole wheat instead of refined white flour would make a difference of about 194 international units, or about 0.58 mg. of thiamine per man daily. These higher amounts of thiamine, so easily obtainable, undoubtedly are of great significance not only for the health of persons in the lower income groups but also for those whose food expenditures are not restricted for financial reasons.

Children's Diets.—The use of whole grain cereal products may result in even more important additions of thiamine to children's diets. Investigations of the thiamine requirements of children of preschool age indicate that approximately 25 international units per kilogram of body weight, equivalent to about 1 mg. (333 international units) of thiamine daily, should be allowed. Because of the rapid growth and physical activity of children, particularly boys of adolescent age, the thiamine requirements of this age group are relatively high and may be higher than those of adults. Standards of 2 mg. of thiamine daily for adolescent girls and of 2.5 mg. for adolescent boys have been suggested. On the basis of the cereal allowances proposed by Carpenter and Stiebeling the exclusive use of whole grain cereals instead of the refined products may be expected to result in the addition of from 65 to 239 international units of vitamin B₁ to the diets of preschool children, from 130 to 333 international units to the diets of children of school age and from 178 to 456 international units to the diets of active adolescent boys, depending on the income level for which the diet is planned. Similarly such use of whole grain cereals may be expected to result in additions of from 1.6 to 4.1 mg. of iron to the diets of preschool children, from 3.1 to 7.3 mg. to the diets of children of school age and from 4.7 to 14.1 mg. to the diets of active adolescent boys.

Although whole grain cereals are nutritionally preferred foods, the Council recognizes that the present day popular preference for white flour cannot be altogether ignored. This preference is based in part on the relatively better keeping qualities of white flour as compared to whole wheat flour and in part on the fact that the baking qualities of the best grades of white flour have been developed to a high state of perfection by the manufacturers of these products. The new enriched white flours provide the housewife with products of physical characteristics and baking qualities similar to those with which she is now accustomed. Because these products are designed to provide dietary essentials for which a wider distribution is important, if not imperative, for certain groups of the population, the Council believes that it is in the interest of public health and welfare to encourage the wider distribution of this type of product, along with the greater use of whole wheat products. The following quotation from an article by Dr. R. R. Williams¹³ in *Cereal Chemistry* is of interest in this connection:

Unquestionably, from a long range business standpoint the greatest opportunity for the miller, and the sugar refiner as well, is to find a way to meet popular demands without continuing to call upon their customers to disregard Nature's laws, or to make up the deficiencies of the carbohydrate staples by judicious use of other foods. One cannot of course ignore the popular fancy for white bread, nor the concrete fact that whole cereals or their mill products are more subject to spoilage than the white forms (in part for the excellent reason that the latter will scarcely support bacterial or insect life). One cannot wholly ignore the testimony of qualified physicians, that branny roughage is irritating to the intestinal tracts of some people, though that is probably more a matter for the hospital dietitian than for the housewife. All these are parts of the large problem which the carbohydrate industries face, that of making their staple products more nearly the equivalent in nutritive value of the whole seed or the cane stalk as it was once consumed by primitive man. Whether this is to be done by additions of synthetic materials or by retention of the original nutritive components of the crude foodstuffs is a question for industry to decide. To blink at the scientific facts, which will presently become common knowledge, will be suicidal for the commercial enterprises concerned.

On the basis of the foregoing report the Council will consider submitted brands of enriched flour and accept those products which comply with its rules. The possibility of considering individual brands of nutritionally improved bread is being studied. With bread, as with enriched flour, the important problems for the industry are the establishment of satisfactory control over the nutritional and sanitary quality of the products and over the accuracy of the advertising claims.

NATIONAL NUTRITION

Almost daily it is becoming more apparent that those nations are most likely to survive which will be able to keep their people and armies supplied with the essentials of the diet necessary for health and growth. Hunger is a devastating phenomenon. Some one with a genius for phraseology has classified hunger into hollow hunger and hidden hunger. Hollow hunger is the form induced by the absence of enough food; hidden hunger occurs in people who satiate themselves with vast quantities of food and fail to realize that certain minimal amounts of protein, carbohydrates, fats, mineral salts and vitamins are essential to health. Here in America, most prosperous of all the nations in the world, both types of hunger are apparent. Statistics on nutrition have been made available based on studies of selected groups in various portions of the country. Some of the conclusions drawn from these figures are hardly warranted by the available evidence but are apparent exaggerations for the purpose of stimulating action. No doubt every one has some malnutrition, if the term is defined as an error of nutrition rather than as under-nutrition.

As a result of the National Nutrition Conference for Defense, doctors, dentists, nurses, home economists, social workers, food technologists, professional nutritionists, farmers, millers, bakers, canners, dairymen, wholesalers, retailers and consumers are beginning to be inspired with the need for better knowledge of nutrition. Indeed, most of the addresses delivered at the National Nutrition Conference for Defense were inspirational rather than scientific, planned, no doubt, by the representatives of the government who for the most part occupied the program, with the definite view of urging people not only to know more about food but to eat more scientifically. Today the situation in nutrition is like an inverted pyramid. At the bottom is the small body of medical scientists, food economists, nutritionists and educators who possess the necessary knowledge for the improvement of national nutrition. The pyramid

expands upward through producers and purveyors of foods to manufacturers of prepared foods and through wholesale and retail distributors; at the broad top are the consumers. This is the type of pyramid which usually falls unless more and more attention is given to the tiny point on which it rests. This point must be broadened; at this point the greatest support and expansion are needed.

No doubt with these ideas in mind, the House of Delegates of the American Medical Association, at the annual session just concluded in Cleveland, adopted the following resolution:

Resolved, That the House of Delegates of the American Medical Association expresses its approval of the general objectives of the National Nutrition Conference for Defense called by the President of the United States and specifically endorses the following recommendations:

1. That research in nutrition be encouraged, with an aim primarily toward (a) improvement of presently known chemical and biologic procedures for estimating the amounts of the essential nutrients in foods and their physiologic availability; (b) more refined technic for the detection of nutritional deficiency states, especially in the subclinical degrees of intensity, and (c) more precise determination, for each of the nutrients, of the optimum and minimum requirements of human subjects under varying conditions;
2. That special attention be paid to the diets and nutritional status of all workers in industry and particularly of those most directly concerned with the national defense effort;
3. That, in providing an adequate diet for pregnant and lactating women and for children, the necessity be appreciated for taking into consideration the whole family situation and the limitations of the budget;
4. That closer cooperation between medical and public health groups and other agencies interested in nutrition be established in order that effective local action may be taken;
5. That medical societies, dental societies and health authorities be represented on all state and community nutrition committees and that medical groups take an increasingly active part in organizing, sponsoring and cooperating in nutrition programs;
6. That efforts be made to stimulate greater interest in nutritional problems among general practitioners and, with this in view, that opportunity for postgraduate training in nutrition be made more widely available, and finally, but vastly more important,
7. That schools of medicine give greater thought to the teaching of nutrition.

This resolution is requoted to emphasize particularly the importance of the first clause, which stresses three basic types of research which need to be intensified and expanded at this time. Without this knowledge, the drive for improved research will never be quite adequate. Until scientific methods for diagnosing sub-clinical degrees of nutritional deficiency are improved, evaluation of such deficiencies is uncertain. Without precise knowledge of the optimal and minimal requirements of essential ingredients under varying conditions, scientific feeding is difficult. Without satisfactory technics for determining the amounts of the essential nutrients available in natural foods, physicians will have to depend on prepared products rather than on natural foods to insure consumption of adequate amounts of essential substances.

The immediate outcome of the National Nutrition Conference for Defense has been largely an inspiration for better teaching of the available information. When educators discover the inadequacies of the available information they are likely to diminish their efforts. The times require increased emphasis on research of a scientific type, such as has already been mentioned and, at the same time, scientific studies dealing with distribution, consumption and inadequacies in the American diet.

PLASMA PROTEINS AND THE LIVER

The recent increased interest in the importance of plasma in the treatment of surgical shock has focused attention again on the question of the origin of the proteins in the plasma. Unlike tissue proteins, which are manufactured by each cell for its own purposes, the plasma proteins must be synthesized and excreted into the circulating blood, perhaps in the same manner as are hormones. Many physiologists believe that the liver is the main if not the sole manufactory for one or more of the plasma proteins. Certainly the albumin fraction of the plasma is frequently low in serious hepatic disease. In a brief but provocative discussion entitled "The Liver Proteins," J. Murray Luck¹ asserts that fibrinogen, an important protein fraction of plasma, undoubtedly originates in the liver. The evidence of the origin of albumin and globulin is conflicting in spite of many experimental and clinical studies. Luck, in his monograph, suggests that "There is great need of series of investigations in which the blood plasma and several organs receive simultaneous study with the object of determining whether qualitative or quantitative changes in the plasma proteins are accompanied by corresponding changes in the proteins of an organ."

This experiment has now been carried out in respect to the liver. In a large series of dogs Elman and Heifetz² by dietary means produced nearly a 50 per cent fall in the albumin fraction of the plasma. There was no change in the concentration of globulin, thus confirming the original observations of Weech and his co-workers.³ Biopsies of the livers in these animals revealed a startling and progressive histologic and chemical change. As the hypoalbuminemia became more pronounced a corresponding fall in the protein content of the liver occurred, the cells becoming more and more vacuolated, so that in six weeks nearly all of the stainable cytoplasm became clear and transparent. The water content increased during this period of observation, although fat and glycogen stains and analyses failed to reveal any deviation from the normal. The St. Louis investigators infer from their

studies that a correlation is thus established between the albumin concentration of the blood and the protein concentration of the liver. Although this does not necessarily mean that the liver is the site of manufacture or storage of this blood protein, it must be, they say, an important "station in the assembly line for the production of serum albumin."

Of practical significance is the therapeutic implication of these observations. Elman and Heifetz found definite evidence of impairment of liver function in these protein-depleted animals. That carbohydrate is essential for maintaining the function of the liver and safeguarding it against hepatic poisons has been known for decades. The importance of protein is now apparent; indeed, experimental studies from other quarters have shown how dietary protein may protect the liver against the poisonous effects of chloroform and of arsenic⁴ as well as or even better than carbohydrate. Thus the relationship of the liver to plasma protein would seem to be a dual one. To maintain efficiency of the liver, it is necessary to guard against protein depletion. To maintain plasma protein, the liver must be in excellent physiologic state.

PROGRESS IN CONTROL OF TRICHINOSIS

Progress in the epidemiologic control of trichinosis is reported by McNaught and Zapater¹ of Stanford University Medical School. Statistics collected from human necropsies a few years ago suggested that nearly 18 per cent² of all American adults are infected with *Trichinella spiralis*. This percentage varies in different localities, an incidence of 27.6 per cent being recorded in Boston,³ 24 per cent in San Francisco,⁴ falling to as low as 3.5 per cent for New Orleans,⁵ with other cities taking an intermediate position. In each locality the incidence of trichinosis in man is closely correlated with that in the local pork supply; hogs in the vicinity of Boston, for example, showed an incidence as high as 18 per cent, with the percentage falling to from 0.1 to 0.8 for New Orleans.⁶ This percentage is apparently determined by local methods of feeding; the highest percentage of swine trichinosis is associated with the feeding of garbage or slaughterhouse offal, and the lowest with feeding of grain or in regions in which the hogs are allowed to run wild in the fields or woods.

Three years ago Hobmaier and Geiger⁷ examined 93 garbage-fed hogs offered for sale in the San Francisco market and found 15 per cent infected with trichinosis. At that time the only politically feasible method of reducing this percentage was rodent control. This was introduced and encouraged in the hog ranches of the San Francisco Bay region, the main source of supply for the San Francisco market. Since the introduction of this hygienic measure the percentage infection of garbage-fed hogs received by San Francisco abattoirs has fallen to 4.04.¹ Rodent control apparently is a statistically verifiable method of reducing trichinosis percentage in garbage-fed swine.

Much more effective methods have been politically feasible in other countries. In the Hawaiian Islands, for example, 13.6 per cent of the wild hogs are infected with *Trichinella*. This has been reduced to 0.3 per cent in hogs kept in concrete or wooden pens and fed cooked garbage.⁸ In Canada all garbage-feeding hog ranches are required to be licensed and inspected, and all garbage is cooked prior to feeding. The inspection includes rodent control. Recent data reported by Cameron⁹ have shown that swine trichinosis has been reduced to 0.2 per cent by the Canadian method. This is less than one twentieth of the present percental infection in San Francisco. As soon as it becomes politically feasible, complete elimination of infected pork should be possible in American markets.

Current Comment

INTERSTITIAL EMPHYSEMA

Until recently, little attempt has been made to visualize the pattern which is formed in the pulmonic interstitial tissue by the presence of air. Investigations of the excised fresh lung of the calf after overinflation by air indicated, according to Macklin,¹ that air from the alveoli invades the pulmonic connective tissue and forms a characteristic pattern in the septums and vascular sheaths. When the septums between subdivisions of the lung become filled with air bubbles they stand out prominently both on the external surfaces of the lobes and on the cut surfaces of slices taken through the fixed lobes of all regions. These bubble filled plates block off polyhedral areas of lung substance of variable shape and size. The sheaths of the pulmonary vessels are also distended by large columns of air bubbles, and intercommunications between the air pockets of the septums and vascular sheaths are noted. The pattern of this aberrant air-containing tissue is like that of the

human lung with interstitial emphysema. During the time air was being forced into the overdistended calf lung by way of the trachea it bubbled forth freely from the lung routes and could be seen to be coming from the vascular sheaths. Macklin concluded that the region of leakage or transfer of air from the alveoli of the connective tissue of the vascular sheaths is that of the terminals of the pulmonary arteries and veins. The condition arising from interference of air in the lung mediastinum and extensions therefrom with the vital functions of respiration and air circulation he calls "air block." This work and the conception of "air block" add much to the understanding of the pathogenesis of interstitial emphysema.

GAS AND DUST MASKS

The Bureau of Mines of the United States Department of the Interior is continuing its investigations of respiratory protective equipment. In the Scientific Exhibit at the annual session of the American Medical Association in Cleveland the bureau displayed approved respiratory protective appliances and gave information regarding their specialized use. Appliances which meet the requirements of the bureau are included on an approved list which is available for the asking. These devices are called respirators, gas masks, supply air respirators (hose mask), abrasive blasting helmets, hoods and masks. They cover either the entire head or merely the nostrils and mouth and are equipped with filters of high filtering efficiency or with an air line connected to a source of fresh air supply. In the case of a gas mask the contaminated air passes through a canister containing a chemical absorbent compound. These devices are intended for removal of contaminants which may render atmosphere irrespirable: either gaseous substances or particulate matter. The efficiency and length of service of the gas mask depend largely on the chemical contents of the canister. Six hour tests in laboratories are made to hasten the chemical stability of the absorbent at various relative humidities and temperatures. The masks are subjected to a variety of gases, such as carbon monoxide, sulfur dioxide, phosphine and carbon tetrachloride. The respirator or filter type is tested against relatively high concentrations of quartz dust, lead dust, chromic acid mist, siliceous mist, lead paint mist or lead fume. The filter must be able to retain considerable dust without due increase in resistance to breathing. Supplied air respirators provide an atmosphere of fresh air around the nose and nostrils of the wearer from a source which is outside the contaminated zone. For this type an air line is essential and must be air tight. These devices are tested under various conditions in the laboratory and also under actual use (man tests). The man tests are regarded important, and the final decision depends on their outcome. Those physicians who are confronted with diseases caused by fumes or heavy dust concentrations such as silicosis will undoubtedly wish to secure from the Bureau of Mines, Washington, D. C., its list of approved respirators.

MEDICAL PREPAREDNESS

In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medical preparedness, and such other information and announcements as will be useful to the medical profession.

ACTIVE IMMUNIZATION AGAINST TETANUS BY VACCINATION WITH TETANUS TOXOID

Circular Letter No. 34
Office of the Surgeon General
Washington

The following instructions will govern the administration of tetanus toxoid to military personnel in situations in which the use of this agent is specifically authorized by the War Department:

1. *Personnel to Be Vaccinated.*—(a) When authorized by the War Department, all military personnel on active duty will be vaccinated and revaccinated with tetanus toxoid as prescribed.

(b) Civilian employees subject to field service with the Army, including those on transports and in the mine planter service, dependents of military personnel and others residing at military stations may be vaccinated similarly against tetanus when such vaccination is requested by them.

(c) The active immunization against tetanus of persons who are in poor physical condition or are suffering from acute disease may be temporarily deferred when, in the opinion of the responsible medical officer, such vaccination would be detrimental to health.

(d) There is no contraindication to giving the first dose of this toxoid concurrently with triple typhoid and smallpox vaccines.

2. *Tetanus Toxoid.*—(a) *Type and Source:* The material used for vaccinations against tetanus will be liquid tetanus toxoid (plain), prepared according to specifications approved by the United States Public Health Service and the Surgeon General of the Army. It will be supplied on requisition by the Medical Supply Officer, New York General Depot, Brooklyn, in 30 cc. and 1 cc. containers.

(b) *Storage and Shipment:* Tetanus toxoid should be stored at a temperature between 2 and 5 C. Exposure to room temperature causes a gradual deterioration of the toxoid. Freezing may cause breakage of the containers and discoloration of the fluid but does not otherwise render the toxoid unfit for use.

3. *Initial Vaccination with Toxoid.*—The initial vaccination consists of a series of three subcutaneous injections of tetanus toxoid (plain) 1 cc. each, administered with intervals of not less than three or more than four weeks, and preferably with intervals of three weeks, between doses. The injection should be made subcutaneously in the deltoid region of the arm. The completion of the series of three injections included in this "initial vaccination" increases the individual's immunity, so that whenever he is subjected to the stimulation of a subsequent injection of toxoid there will be produced in his body sufficient antitoxin to protect against tetanus.

4. *Subsequent Vaccination with Tetanus Toxoid.*—After the completion of the three injections included in the "initial vaccination," a single "stimulating" dose of 1 cc. of tetanus toxoid will be injected subcutaneously at the times indicated:

(a) Under normal conditions a "stimulating" dose will be administered at the end of the first year only, regardless of duration of service.

(b) In time of war a "stimulating" dose will be administered during the month prior to departure for a theater of operations unless such departure is within a period of six months subsequent to the "stimulating" dose prescribed in a.

(c) *Emergency Dose of Toxoid:* In addition to the initial and subsequent vaccinations, an emergency "stimulating" dose will be administered immediately:

(1) To each individual who incurs a wound or severe burn on the battlefield.

(2) To patients undergoing secondary operations or manipulations of old wounds when deemed advisable by the responsible medical officer.

(3) To others who incur punctured or lacerated nonbattle wounds, powder burns or other conditions which might be complicated by the introduction of *Clostridium tetani* into the tissues.

5. *Passive Immunization Against Tetanus by the Use of Tetanus Antitoxin.*—Tetanus antitoxin will be used for the treatment of clinical tetanus and, when indicated, for the prevention of tetanus in persons who have not previously been actively immunized with tetanus toxoid. The administration of tetanus antitoxin will be limited:

(a) To patients presenting evidence of clinical tetanus.

(b) To persons who incur wounds or other conditions which necessitate their protection against tetanus but who have not previously completed the initial vaccination with tetanus toxoid as directed in paragraph 3.

(c) To wounded persons who may have been previously vaccinated but whose records of vaccination are lost or not available.

Persons referred to in *b* and *c* will be immediately immunized passively with adequate amounts of tetanus antitoxin and at the same time will be vaccinated with tetanus toxoid as directed in paragraph 3.

6. *Records of Tetanus Immunization.*—When a person is immunized against tetanus, the senior medical officer of the command will be responsible for the proper recording of the same as directed.

(a) *Vaccination with Tetanus Toxoid:* A record in duplicate will be made on Medical Department Form Number 81 (Immunization Register) of the dates on which each of the individual injections of tetanus toxoid, both initial and subsequent, are administered and these notations will be initialed by the responsible medical officer. The Immunization Register will be disposed of as prescribed in paragraph 6 AR 40-215. On completion of the three injections of tetanus toxoid required for the "initial" vaccination, in paragraph 3, a permanent record will be made by stamping clearly on the individual's identification tag the letter T followed by figures indicating the year in which immunization was completed. An additional date will in a similar manner record the administration of the "stimulating" dose. Thus T40-41 would indicate that the person completed his initial vaccination in 1940 and received a "stimulating" dose a year later, in 1941. These data will be stamped in the space immediately to the right of the serial number. Owing to lack of space on the identification tag, the month in which the vaccinations are completed cannot be recorded thereon. However, this information will appear in the Service Record and the Immunization Register of the individual, where it will afford a basis for determining when the "stimulating" dose is to be given. The remaining space on the identification tag may be required for the recording of the individual's blood type.

In case the identification tag is lost, the record of tetanus vaccination as shown on the Immunization Register or on the Service Record will be stamped on the new tag. The information concerning tetanus immunization recorded on the identification tag must be accurate, as later it may afford the only basis for determining what treatment is required for a wounded individual.

By order of the Surgeon General:

JOE A. BAIN, M.D.
Captain, Medical Corps,
Acting Assistant Executive Officer.

ARMY RESERVE OFFICERS ORDERED TO ACTIVE DUTY FOURTH CORPS AREA

The following additional medical reserve corps officers have been ordered to active duty by the Commanding General, Fourth Corps Area, which comprises the states of Tennessee, North Carolina, South Carolina, Alabama, Georgia, Mississippi, Florida and Louisiana:

BOOTH, Thomas Eugene, 1st Lieut., Montgomery, Ala., Fort Bragg, N. C.
CHRISMAN, Reuben B., Jr., 1st Lieut., Nashville, Tenn., Camp Forrest, Tenn.
COLES, William Cruse, 1st Lieut., Augusta, Ga., Fort Benning, Ga.
FARRIOR, James H., 1st Lieut., Montgomery, Ala., Fort Bragg, N. C.
GAVIN, James Foster, 1st Lieut., Fort Gaines, Ga., Fort Bragg, N. C.
KIMATA, Harold Tamaki, 1st Lieut., New Orleans, Fort Bragg, N. C.
McFARLAND, James J., Jr., 1st Lieut., Lebanon, Tenn., Camp Claiborne, La.
MARCY, John Orburn, 1st Lieut., Bristol, Tenn., Camp Livingston, La.
WESTERFIELD, James A., 1st Lieut., Merigold, Miss., Camp Claiborne, La.

Orders Revoked

ALVERSON, Reginald C., 1st Lieut., Greer, S. C.
ASLING, Clarence W., 1st Lieut., Nashville, Tenn.
AUERBACH, Stewart H., Captain, Augusta, Ga.
BARFIELD, William E., 1st Lieut., Jackson, Ga.
BENNETT, William M., Captain, Ruffin, S. C.

FIFTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Fifth Corps Area, which comprises the states of Ohio, West Virginia, Indiana and Kentucky:

ABBOTT, Osler A., 1st Lieut., Cincinnati, Fort Knox, Ky.
COERS, Burt M., 1st Lieut., Circleville, Ohio, Fort Thomas, Ky.
DOLE, John A., Jr., 1st Lieut., Ironton, Ohio, Fort Benjamin Harrison, Ind.
DUTTON, Arthur S., 1st Lieut., Put-in-Bay, Ohio, Fort Knox, Ky.
HOFFMAN, Henry L., 1st Lieut., Cleveland, Fort Knox, Ky.
LAMEY, James L., 1st Lieut., Anderson, Ind., Fort Benjamin Harrison, Ind.

SEVENTH CORPS AREA

The following additional medical reserve corps officers have been ordered to extended active duty by the Commanding General, Seventh Corps Area, which comprises the states of North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Kansas, Missouri, Arkansas and Wyoming:

CLARKE, William Oscar, 1st Lieut., Minneapolis, Corps Area Service Command Station Hospital, Fort Leonard Wood, Mo.
DOBIAS, Stephen Glenn, 1st Lieut., Chelsea, Iowa, Corps Area Service Command U. S. Disciplinary Barracks, Fort Leavenworth, Kan.
EUBANK, William Richards, 1st Lieut., Kansas City, Kan., Corps Area Service Command Station Hospital, Fort Leonard Wood, Mo.
LEWIS, George Kenneth, Major, Garden City, Kan., 63d Infantry, Fort Leonard Wood, Mo.
SMITH, William Russell, 1st Lieut., Carthage, Mo., Corps Area Service Command Station Hospital, Fort Leavenworth, Kan.
WHITE, Charles Herbert, 1st Lieut., Kansas City, Mo., Corps Area Service Command Station Hospital, Fort Leonard Wood, Mo.

THE MEDICAL RESERVE CORPS

Almost one half of the reserve officers of the Army Medical Corps have been ordered to extended active duty, principally in the lower ranks. As of April 30, there were 12,126 medical reserve officers, of whom 5,891 were on extended active duty. However, only 9 out of 150 reserve colonels had been ordered to active duty and only 80 out of 349 lieutenant colonels. The remainder of the active list shows 270 out of 590 majors; 1,168 out of 1,914 captains, and 4,364 out of 9,123 lieutenants. The number of medical reserve officers available has been reduced by more than 1,000 during the past few months by resignations and physical examinations.

DANIEL, Rollin A., Jr., Captain, Nashville, Tenn.
ELDRIDGE, Jesse C., Lieut. Col., Chattanooga, Tenn.
FARRAGUT, Loyall D., Captain, Jackson, Tenn.
FULENWIDER, John O., Jr., 1st Lieut., Pageland, S. C.
GREEN, Edgar V., 1st Lieut., Youngsville, N. C.
GRIFFIN, Eugene L., 1st Lieut., Augusta, Ga.
HILL, Thurman K., 1st Lieut., Decatur, Ga.
JONES, Andrew M., 1st Lieut., Athens, Ga.
LYLE, Philip Lewis, 1st Lieut., Clarksville, Tenn.
MacPHERSON, Ford J., 1st Lieut., Baltimore.
MASON, James Monroe, III, 1st Lieut., Birmingham, Ala.
MASTERSON, Rodney G., 1st Lieut., Alexandria, La.
MURPHY, Robert J., Jr., 1st Lieut., Sanatorium, N. C.
PARKS, Harry, 1st Lieut., Atlanta, Ga.
PETERSON, Bedford F., 1st Lieut., Knoxville.
POWELL, William F., 1st Lieut., New Orleans, La.
RAMEY, Daniel R., Jr., 1st Lieut., Holt, Ala.
RUSSELL, John Charles, 1st Lieut., Cleveland, Miss.
SANDUSKY, William R., Captain, Pensacola, Fla.
SHEPARD, Richard C., Captain, LaFayette, Ga.
STANDER, Alvin A., 1st Lieut., Baton Rouge, La.
STEGALL, Oscar B., 1st Lieut., Memphis, Tenn.
STEWART, James B., 1st Lieut., Milledgeville, Ga.
THOMAS, Paul Jasper, 1st Lieut., New Orleans.
VINSANT, Lowell E., 1st Lieut., Knoxville, Tenn.
VAN HOOSER, John L., 1st Lieut., Smithville, Tenn.
WEAVER, Thomas S., 1st Lieut., Nashville, Tenn.
WRIGHT, Leonard D., 1st Lieut., Memphis, Tenn.

LAWN, Harold J., 1st Lieut., Marion, Ind., Fort Benjamin Harrison, Ind.
LYNCH, Cornelius G., Jr., 1st Lieut., Toledo, Ohio, Fort Knox, Ky.
McKEE, Wilbur F., 1st Lieut., Bryan, Ohio, Fort Knox, Ky.
SUBLETT, Daniel V., 1st Lieut., Lexington, Ky., Fort Knox, Ky.
WONER, John W., 1st Lieut., Linton, Ind., Huntington, W. Va.

Relieved from Active Duty

CHRENKA, Paul, 1st Lieut., Cleveland, at Fort Thomas, Ky.
OCKULY, Edward F., 1st Lieut., Toledo, Ohio, Fort Knox, Ky.

Orders Revoked

GEIGER, Franklin R., 1st Lieut., Cincinnati.

Orders Revoked

ALDERSON, Clair Milton, 1st Lieut., Dodge City, Kan., 53d Evacuation Hospital, Camp San Luis Obispo, Calif.
CLINE, Harold Hadley, 1st Lieut., Piedmont, Mo., C. A. S. C. Station Hospital, Camp J. T. Robinson, Ark.
CLINTON, Lloyd Brandon, Captain, Carthage, Mo., C. A. S. C. Induction Station, Fort Leavenworth, Kan.
COPE, Josef Shelton, Captain, Lexington, Mo., Corps Area Service Command Induction Station, Fort Leavenworth, Kan.
DONOHUE, Edmund Stephen, 1st Lieut., Sioux City, Iowa, Engineer Replacement Center Infirmary, Fort Leonard Wood, Mo.
EDERER, John Joseph, 1st Lieut., Mahanomen, Minn., 9th Army Corps Troops, Fort Lewis, Wash.
FRITSCH, Carl J., 1st Lieut., New Ulm, Minn., Corps Area Service Command Replacement Center Infirmary, Fort Riley, Kan.
GALEOTA, William Richard, 1st Lieut., Fort Jackson, S. C., C. A. S. C. Induction Station, Fort Snelling, Minn.
GILFILLAN, Clarence David Neuton, 1st Lieut., Eldon, Iowa, Corps Area Service Command Engineer Replacement Training Center Infirmary, Fort Leonard Wood, Mo.

WHITNEY, Richard Aurie, 1st Lieut., Cambridge, Minn., 30th Field Artillery, Camp Roberts, Calif.

WOERN, William Henry, 1st Lieut., England, Ark., Corps Area Service Command Induction Station, Fort Snelling, Minn.
ZAESKE, Edward Vernon, 1st Lieut., Charter Oak, Iowa, 1st Medical Regiment, Fort Ord, Calif.

Relieved from Extended Active Duty

BUTT, William Jackson, 1st Lieut., Fayetteville, Ark., 214th General Hospital, Camp J. T. Robinson, Ark.
CAPETTI, Alexander Pasquale, 1st Lieut., Crane, Mo., Corps Area Service Command Induction Station, Fort Des Moines, Iowa (relieved at Fort Des Moines, Iowa).
EGLEY, Loren Edward, 1st Lieut., Maryville, Mo., 85th Field Artillery, Camp Roberts, Calif.
KURTH, Clarence Joseph, 1st Lieut., Council Bluffs, Iowa, Corps Area Service Command Station Hospital, Fort Leonard Wood, Mo. (relieved at Fort Crook, Neb.).
PALMERTON, Ernest Sterling, 1st Lieut., Albert Lea, Minn., 85th Field Artillery, Camp Roberts, Calif.
PLATZ, John Herschel, Captain, Carrollton, Mo., 155th Station Hospital, Camp Roberts, Calif.
SAUNDERS, Everett Lewis, 1st Lieut., Independence, Mo., Corps Area Service Command Induction Station, Jefferson Barracks, Mo.
SCHWARTZ, Herbert F., 1st Lieut., M. R. C., Koch, Mo., Lawson General Hospital, Atlanta, Ga.
SENN, Emmett Jacob, 1st Lieut., M. R. C., Herculaneum, Mo., Corps Area Service Command Replacement Center Infirmary, Fort Riley, Kan.
STERLING, Allen Fred, 1st Lieut., Norway, Iowa, Corps Area Service Command Induction Station, Jefferson Barracks, Mo.

HEART SOUND RESEARCH TO AID THE SELECTION OF PILOTS

Aviation medicine is rapidly advancing and multiplying its instruments for the study of the reactions of the human body to various flight conditions. The latest instrument to come under study for adaptability to pilot testing is one that records the sound waves of the heart beat at the same time at which it records the electrocardiogram. With this instrument a doctor can obtain a graphic picture of the heart beat which in conjunction with the electrocardiogram will give an objective record for further study, reinforcing the usual examination with the stethoscope.

Experimental studies to develop a method to use this device in selecting candidates for pilot training are now in progress. The Work Projects Administration in cooperation with the Civil Aeronautics Administration has organized a research project to evaluate the heart sound record in order to determine its usefulness in mass examinations of candidates applying for training as pilots. The project will endeavor to set up a set of standards of heart sounds for comparison with the records of individual candidates.

The studies will follow plans outlined by Dr. Dean R. Brimhall, CAA Director of Research, and Dr. Raymond Franzen, Statistical Consultant to the CAA. WPA workers will be trained in the handling of the instruments and the correct manner of taking heart sound records of the persons examined experimentally in establishment of the scale.

These records, following photographic processing, will be examined and measured statistically, as would any biometric measure, to determine the incidence or range of occurrence within a normal population of the various elements of heart sounds. The graphic heart records also will be examined by a competent cardiologist.

The scale to be thus set up for comparison with the stethograms of individual candidates for pilot training should be valuable in eliminating candidates whose heart sound records indicate that they would not be able to stand the physical strain of constant flying.

This research will be followed by other studies on the effects of protracted flights and various flight conditions on the heart. With the objective records of heart action, doctors will be able to study the cardiac cycle of individual pilots over a period of years.

The project in New York which is conducting this heart sound research is a unit of the WPA National Defense Research and Records Assistance Project.

This work when completed will be incorporated into the medical examinations of the Civilian Pilot Training Program of the CAA, which is contributing pilots in large numbers to the Army and Navy for further training in military aviation.

SYPHILIS AMONG SELECTEES AND VOLUNTEERS

The Division of Venereal Diseases of the United States Public Health Service announced on June 12 that unpublished analyses of serologic and clinical examinations of 1,070,000 selectees and volunteers, as of April 15, 1941, indicate a total of about 48,500 cases of syphilis. For white selectees and volunteers for whom reports were submitted the rate was 18.5 per thousand; for Negroes, 241.2 per thousand.

The Division of Venereal Diseases recommends that each state and local health department set in motion a comprehensive prehabilitation education program for selectees which would involve as a minimum the distribution of a leaflet to all registrants at the time of the second registration, July 1, followed by concerted efforts at preclassification blood tests. At the time of registration and following, posters can be placed, Asst. Surg. Gen. R. A. Vonderlehr, stated, at strategic points urging men required to register to have a blood test for syphilis and a complete physical examination.

HOFF HALL AT CARLISLE BARRACKS

Another unit in the extensive program of construction at the Medical Field Service School, Carlisle Barracks, Pa., is the new Hoff Hall, the cornerstone of which was laid with appropriate ceremony, June 26. The old building by this name was razed last year to make way for the construction of quarters for officers. The new Hoff Hall, which contains lecture rooms, a large library, amphitheater and offices, is made of native limestone quarried on the military reservation. Hoff Hall is named in memory of a distinguished medical officer, Col. John Van Rensselaer Hoff, who was one of the earliest medical officers of the United States Army to realize the importance of training medical officers as well as enlisted men in field duties, drill and tactics. Colonel Hoff is said to have organized the first detachment of the hospital corps in the army in 1887 and the first company of instruction in the hospital corps in 1891. Among many assignments during his long army service were that of assistant surgeon general, chief surgeon in the Philippines and other departments, and observer with the Russian army in the Russo-Japanese War.

The Medical Field Service School was established soon after the first World War, and through the intervening years many classes of army officers have graduated. When the present emergency arose, the regular classes were abandoned and, instead, classes of about five hundred medical officers a month have been put through the school. These intensive training courses necessitated the use of temporary barracks and other buildings, needs for which the new Hoff Hall school building will answer to a great extent.

ORGANIZATION SECTION

PROCEEDINGS OF THE CLEVELAND SESSION

MINUTES OF THE NINETY-SECOND ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD IN CLEVELAND, JUNE 2-6, 1941

MINUTES OF THE SECTIONS

SECTION ON PRACTICE OF MEDICINE

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9:10 by the chairman, Dr. Fred M. Smith, Iowa City.

Dr. Frank H. Bethell, Ann Arbor, Mich., read a paper on "Lymphatic (Lymphogenous) Leukemia: Diagnostic and Therapeutic Considerations Based on an Analysis of Its Morphologic and Clinical Variants."

Dr. B. K. Wiseman, Columbus, Ohio, read a paper on "Important Facts Additive to the Clinical and Hematologic Recognition of Atypical Lymphatic Leukemia."

Dr. C. P. Rhoads, New York, read a paper on "Clinical and Laboratory Studies of the Effect of Radioactive Phosphorus on Leukemia."

These three papers were discussed by Drs. Russell L. Haden, Cleveland; Shields Warren, Boston; Raphael Isaacs, Chicago; B. K. Wiseman, Columbus, Ohio, and C. P. Rhoads, New York.

Dr. Warfield T. Longcope, Baltimore, read the Frank Billings Lecture on "Sarcoidosis or Besnier-Boeck-Schaumann's Disease." Dr. Longcope was introduced by Dr. Walter L. Biering of Des Moines, Iowa, who gave a brief historical review of the Frank Billings lectures of previous years.

Dr. Ovid O. Meyer, Madison, Wis., read a paper on "Therapeutic Experiences in Hodgkin's Disease." Discussed by Drs. Raphael Isaacs, Chicago, and W. Edward Chamberlain, Philadelphia.

Dr. Merrill C. Sosman, Boston, read a paper on "Roentgen Observations in Hodgkin's Disease (Lymphoblastoma), Sarcoidosis and Erythema Nodosum." Discussed by Drs. Eugene P. Pendergrass, Philadelphia, and John W. Pierson, Baltimore.

THURSDAY, JUNE 5—MORNING

The following officers were elected: chairman, Dr. Roy W. Scott, Cleveland; vice chairman, Dr. G. K. Fenn, Chicago; secretary, Dr. William D. Stroud, Philadelphia; delegate, Dr. James E. Paullin, Atlanta, Ga.; alternate, Dr. William B. Breed, Boston; executive committee: Dr. William S. McCann, Rochester, N. Y.; Dr. Fred M. Smith, Iowa City, and Dr. Roy W. Scott, Cleveland; member of the American Board of Internal Medicine, Dr. Ernest E. Irons, Chicago.

Drs. Willis M. Fowler and A. P. Barer, Iowa City, presented a paper on "Blood Donors: Their Rate of Hemoglobin Regeneration."

Drs. Max M. Strumia and John J. McGraw, Bryn Mawr, Pa., presented a paper on "Blood Plasma: Its Place in the Practice of Medicine, with Special Consideration to the Problems of Preservation."

These two papers were discussed by Drs. Charles A. Doan, Columbus, Ohio; Paul I. Hoxworth, Cincinnati; Willis M. Fowler, Iowa City, and Max M. Strumia, Bryn Mawr, Pa.

Dr. Fred M. Smith, Iowa City, read the chairman's address, entitled "Concerning the Examination of the Heart for Military Service."

Drs. Paul S. Rhoads, W. H. Tucker and Benjamin Rappaport, Evanston, Ill., presented a paper on "Management of Scarlet Fever Contacts." Discussed by Drs. Arthur T. McCormack, Louisville, Ky.; Jesse G. M. Bullowa, New York, and Paul S. Rhoads, Evanston, Ill.

Dr. Russell M. Wilder, Rochester, Minn., read a paper on "Nutrition: A Public Health Problem." Discussed by Dr. Tom D. Spies, Cincinnati.

Dr. Edward J. Stieglitz, Garrett Park, Md., read a paper on "Geriatrics in National Defense." Discussed by Dr. Edward L. Bortz, Philadelphia.

FRIDAY, JUNE 6—MORNING

A joint meeting was held with the Section on Pharmacology and Therapeutics.

Drs. Robert L. Levy, James E. Patterson, Thomas W. Clark and Howard G. Bruenn, New York, presented a paper on "The 'Anoxemia Test' as an Index of the Coronary Reserve: Serial Observations in Patients with Their Application to the Detection and Clinical Course of Coronary Insufficiency." Discussed by Drs. Roy W. Scott, Cleveland, Arlie R. Barnes, Rochester, Minn.; C. T. Burnett, Denver, and Robert L. Levy, New York.

Drs. George V. LeRoy and S. S. Snider, Chicago, presented a paper on "The Sudden Death of Patients with Few Symptoms of Heart Disease." Discussed by Drs. George K. Fenn, Chicago; Harold E. B. Pardee, New York, and George V. LeRoy, Chicago.

Dr. George Morris Piersol, Philadelphia, read a paper on "Physical Therapy in Internal Medicine." Discussed by Drs. John S. Coulter, Chicago; Ralph Pemberton, Philadelphia, and George Morris Piersol, Philadelphia.

Drs. George E. Fahr and J. S. LaDue, Minneapolis, presented a paper on "Therapeutic Efficiency of a Digitalis Glucoside, Lanatoside C, in Congestive Heart Failure with Normal Sinus Rhythm." Discussed by Drs. Arlie R. Barnes, Rochester, Minn.; William H. Bunn, Youngstown, Ohio; William D. Stroud, Philadelphia; J. S. LaDue, Minneapolis, and George E. Fahr, Minneapolis.

Drs. Jesse G. M. Bullowa, Nathan H. Shackman and Daniel Stats, New York, presented a paper on "Chemotherapy of Pneumonias and Immunity Reactions." Discussed by Drs. William H. Kelley, Charleston, S. C.; Lynn T. Hall, Omaha; John W. Brown, San Francisco; Norman H. Plummer, New York, and Jesse G. M. Bullowa, New York.

Dr. Albert H. Rowe, Oakland, Calif., read a paper on "Elimination Diets for the Diagnosis of Food Allergy." Discussed by Drs. Ralph G. Mills, Decatur, Ill.; C. N. Hensel, St. Paul; Joseph Muller, Worcester, Mass., and Albert H. Rowe, Oakland, Calif.

SECTION ON SURGERY, GENERAL AND ABDOMINAL

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Lloyd Noland, Fairfield, Ala.

Dr. Frederick F. Boyce, New Orleans, read a paper on "Carcinoma of the Stomach in a Large General Hospital."

Drs. Waltman Walters, H. K. Gray and James T. Priestley, Rochester, Minn., presented a paper on "Malignant Lesions of the Stomach: Importance of Early Treatment and Results."

These two papers were discussed by Drs. George T. Pack, New York; A. W. Oughterson, New Haven, Conn.; Robert Zollinger, Boston; Walter L. Palmer, Chicago, and Waltman Walters, Rochester, Minn.

Dr. J. Dewey Bisgard, Omaha, read a paper on "The Effect of Hot and Cold Applications to the Abdominal Wall and Also Hot and Cold Fluids Administered by Mouth on Gastric and Intestinal Secretory and Peristaltic Activity." Discussed by Drs. James M. Winfield, Detroit; Charles W. Mayo, Rochester, Minn., and J. Dewey Bisgard, Omaha.

Drs. Octa C. Leigh Jr. and Richard O. Diefendorf, New York, presented a paper on "The Miller-Abbott Tube in Surgery." Discussed by Dr. Grover C. Penberthy, Detroit.

Drs. R. Sterling Mueller and James E. Thompson, New York, presented a paper on "The Local Use of Powdered Sulfanilamide in Infections of the Peritoneal Cavity."

Drs. Howard C. Jackson and Frederick A. Collier, Ann Arbor, Mich., presented a paper on "The Use of Sulfanilamide in the Peritoneum: Experimental and Clinical Observations."

These two papers were discussed by Drs. Henry W. Cave, New York; James E. Thompson, New York; Alton Ochsner, New Orleans; Frederick A. Collier, Ann Arbor, Mich.; F. L. Reichert, San Francisco; Misch Casper, Louisville, Ky., and R. Sterling Mueller, New York.

THURSDAY, JUNE 5, 1941—AFTERNOON

The following officers were elected: chairman, Arthur W. Allen, Boston; vice chairman, William L. Estes Jr.; Bethlehem, Pa.; secretary, Alton Ochsner, New Orleans; delegate, Henry W. Cave, New York; alternate, Grover C. Penberthy, Detroit; representative on American Board of Surgery, Edward D. Churchill, Boston (to succeed Howard M. Clute, resigned); governor American College of Surgeons, Thomas E. Jones, Cleveland; members American Board of Plastic Surgery: V. P. Blair, St. Louis; William S. Kiskadden, Los Angeles, and Gustave Aufricht, New York; executive committee; Dr. Thomas M. Joyce, Portland, Ore.; Lloyd Noland, Fairfield, Ala., and Arthur W. Allen, Boston.

Drs. H. Glenn Bell and Leon Goldman, San Francisco, presented a paper on "The Surgical Management of Gallbladder Disease as Correlated with Newer Physiologic Concepts." Discussed by Dr. Warren H. Cole, Chicago.

Drs. William H. Meade and Carroll H. Long, New Orleans, presented a paper on "The Use of Cotton as a Suture Material, with Particular Reference to Its Clinical Application." Discussed by Drs. Donald Guthrie, Sayre, Pa.; John M. Farris, Ann Arbor, Mich.; John E. Cannaday, Charleston, W. Va.; Alton Ochsner, New Orleans, and Carroll H. Long, New Orleans.

Drs. William E. Ladd and Robert R. White, Boston, presented a paper on "Embryoma of the Kidney (Wilms Tumor)." Discussed by Drs. James T. Priestley, Rochester, Minn.; Monroe Wolf, New Orleans, and William E. Ladd, Boston.

Dr. Lloyd Noland, Fairfield, Ala., read the chairman's address, entitled "Diagnosis, a Responsibility of the Surgeon."

Dr. Alfred Goldman, San Francisco, read a paper on "Cancer of the Lung of Long Duration." Discussed by Dr. Edward J. O'Brien, Detroit.

Drs. Geza de Takats and Howard E. Heyer, Chicago, presented a paper on "The Surgical Approach to Hypertension." Discussed by Drs. Reginald H. Smithwick, Boston; Claude S. Beck, Cleveland; Edgar Kahn, Ann Arbor, Mich., and Geza deTakats, Chicago.

Drs. Claude E. Welch and Henry H. Faxon, Boston, presented a paper on "Phlebitis and Pulmonary Embolism." Discussed by Drs. Alton Ochsner, New Orleans; Henry A. H. Faxon, Boston, and Conrad R. Lam, Detroit.

FRIDAY, JUNE 6—MORNING

A joint meeting was held with the Section on Orthopedic Surgery. The proceedings are reported in the minutes of that section.

SECTION ON OBSTETRICS AND GYNECOLOGY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Norman F. Miller, Ann Arbor, Mich.

Drs. Samuel A. Cosgrove and James F. Norton, Jersey City, N. J., presented a paper on "Indications and Relative Merits of the Classic, Low and Extraperitoneal Cesarean Sections."

Dr. Frederick H. Falls, Chicago, read a paper on "Mortality, Early and Late, Following Cesarean Section."

These two papers were discussed by Drs. Louis E. Phaneuf, Boston; H. Hudnall Ware Jr., Richmond, Va.; Joseph B. De Lee, Chicago; James F. Norton, Jersey City, N. J., and Frederick H. Falls, Chicago.

Dr. Daniel G. Morton, San Francisco, read a paper on "Early Diagnosis and Proper Management in Cervical Cancer." Discussed by Drs. Ralph E. Campbell, Madison, Wis.; George Gray Ward, New York; John J. Gilbride, Philadelphia; Emil Novak, Baltimore; Charles E. Galloway, Evanston, Ill.; E. H. Kloman, Baltimore, and Daniel G. Morton, San Francisco.

Dr. Charles H. Peckham Jr., Cooperstown, N. Y., read a paper on "Certain Legal and Therapeutic Aspects of the Problem of Syphilis and Pregnancy." Discussed by Drs. Carl P. Huber, Indianapolis; Herman Beerman, Philadelphia, and Charles H. Peckham Jr., Cooperstown, N. Y.

Drs. Brooke M. Anspach and John B. Montgomery, Philadelphia, presented a paper on "The Simpson Operation and the Smith Pessary in the Treatment of Retroflexioversion of the Uterus in the Child-Bearing Woman." Discussed by Drs. Paul Titus, Pittsburgh; Arthur H. Bill, Cleveland; Willard R. Cooke, Galveston, Texas; William H. Weir, Cleveland; Channing W. Barrett, Chicago, and Brooke M. Anspach, Philadelphia.

THURSDAY, JUNE 5—MORNING

Dr. Samuel H. Geist, New York, read a paper on "Androgen Therapy in Gynecology."

Dr. E. C. Hamblen, Durham, N. C., read a paper on "Uses and Limitations of Estrogens in Gynecic Practice."

These two papers were discussed by Drs. Charles Mazer, Philadelphia; Ludwig A. Emge, San Francisco; Jean Paul Pratt, Detroit; James B. Hamilton, New Haven, Conn.; Karl John Karnaky, Houston, Texas; Udall J. Salmon, New York; Samuel H. Geist, New York, and E. C. Hamblen, Durham, N. C.

Dr. Rachelle Seletz, Los Angeles, read a paper on "Pruritus Ani and Vulvae: Diagnosis and Management." Discussed by Drs. E. W. Netherton, Cleveland; H. C. Hesseltine, Chicago; Karl John Karnaky, Houston, Texas; Goodrich C. Schauffler, Portland, Ore.; Samuel G. Slo-Bodkin, Brooklyn, and Rachelle Seletz, Los Angeles.

Dr. Irving F. Stein, Chicago, read a paper on "Deflexion Attitudes in Breech Presentation." Discussed by Drs. Harold Henderson, Detroit; Joseph B. De Lee, Chicago; Euclid T. Gaddy, Indianapolis, and Irving F. Stein, Chicago.

Drs. Paul F. Fletcher and Ora J. Gibson, St. Louis, presented a paper on "Sulfathiazole in the Treatment of Gonorrhea in Women." Discussed by Drs. William H. Vogt, St. Louis; William Bickers, Richmond, Va., and Paul F. Fletcher, St. Louis.

Dr. Norman F. Miller, Ann Arbor, Mich., read the chairman's address, entitled "The Perpetuation of Error in Obstetrics and Gynecology."

FRIDAY, JUNE 6—MORNING

The following officers were elected: chairman, Dr. Walter Dannreuther, New York; vice chairman, Dr. LeRoy Adelbert Calkins, Kansas City, Mo.; secretary, Dr. Philip F. Williams, Philadelphia; delegate, Dr. Jean Paul Pratt, Detroit; alternate, Dr. Harvey B. Matthews, Brooklyn; representatives to American Committee on Maternal Welfare: Dr. Goodrich C. Schauffler, Portland, Ore.; Dr. Everett D. Plass, Iowa City, and Dr. Robert D. Mussey, Rochester, Minn.; representative to Scientific Exhibit, Dr. Charles E. Galloway, Evanston, Ill.

Drs. Robert D. Mussey and Arthur B. Hunt, Rochester, Minn., presented a paper on "The Toxemias of Pregnancy: Their Classification an Aid to Management of Parturition."

Dr. Roy E. Nicodemus, Danville, Pa., read a paper on "The Importance of Oxygen Tent Therapy as an Additional Measure in the Conservative Treatment of Eclampsia." Discussed by Drs. Thaddeus L. Montgomery, Philadelphia, and Roy E. Nicodemus, Danville, Pa.

Dr. Goodrich C. Schauffler, Portland, Ore., read a paper on "Pregnancy with Double Uterus and Vagina; Complications, Management and Prognosis." Discussed by Drs. Norman F. Miller, Ann Arbor, Mich., and Goodrich C. Schauffler, Portland, Ore.

Dr. Robert L. Dickinson, New York, read a paper on "The Premarital Medical Consultation." Discussed by Drs. Sophia J. Kleegman, New York; Marie Pichel Warner, New York; Anna K. Daniels, New York; Robert W. Laidlaw, New York; William H. Weir, Cleveland, and Robert L. Dickinson, New York.

Drs. J. P. Greenhill and S. C. Freed, Chicago, presented a paper on "The Electrolyte Therapy of Premenstrual Distress." Discussed by Drs. Jacob Kotz, Washington, D. C.; Karl John Karnaky, Houston, Texas; Esther B. Tietz, Longview State Hospital, Cincinnati, and J. P. Greenhill, Chicago.

SECTION ON OPHTHALMOLOGY

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Albert C. Snell, Rochester, N. Y.

Dr. Albert C. Snell, Rochester, N. Y., read the chairman's address, entitled "Some Principles of Medical Ethics and the Practice of Ophthalmology."

Dr. Arthur J. Bedell, Albany, N. Y., read a paper on "Traumatic Changes in the Retina, Choroid, Nervehead and Vitreous." Discussed by Drs. Parker Health, Detroit; Morris Davidson, New York; M. M. Cullom, Nashville, Tenn., and Arthur J. Bedell, Albany.

Dr. Albert L. Brown, Cincinnati, read a paper on "Lime Burns of the Eye. The Use of Rabbit Peritoneum to Prevent Severe Delayed Effects: Experimental Studies and Report of Cases." Discussed by Drs. Eugene L. Bulson, Fort Wayne, Ind.; Robert J. Masters, Indianapolis, and Albert L. Brown, Cincinnati.

Drs. Glen Gregory Gibson and Lawrence W. Smith, Philadelphia, presented a paper on "Retinal Phlebosclerosis." Discussed by Drs. Cecil S. O'Brien, Iowa City; Henry Patrick Wagener, Rochester, Minn., and Glen Gregory Gibson, Philadelphia.

Dr. Ferdinand L. P. Koch, New York, read a paper on "Retinal Arterial Diastolic Blood Pressure and the Caliber of the Retinal Arterioles in Systemic Vascular Hypertension: A Clinical Study." Discussed by Drs. Irving Puntenney, Chicago; James E. Lebensohn, Chicago, and Ferdinand L. P. Koch, New York.

Dr. Alfred Cowan, Philadelphia, read a paper on "Causes of Blindness in Pennsylvania: An Analysis of a Group of Over Thirty Thousand Blind Eyes." Discussed by Drs. C. W. Rutherford, Indianapolis; Harry S. Gradle, Chicago; Conrad Berens, New York, and Alfred Cowan, Philadelphia.

THURSDAY, JUNE 5—AFTERNOON

Dr. Phillips Thygeson, New York, read a paper on "The Epidemiology of Inclusion Conjunctivitis." Discussed by Drs. Alson E. Braley, Detroit; L. A. Julianelle, St. Louis; James E. Lebensohn, Chicago, and Phillips Thygeson, New York.

Drs. Jack S. Guyton and Alan C. Woods, Baltimore, presented a paper on "Etiology of Uveitis: A Clinical Study of Five Hundred and Sixty-Two Cases." Discussed by Drs. Walter F. Duggan, Utica, N. Y.; John S. McGavic, New York; T. L. Terry, Boston, and Alan C. Woods, Baltimore.

Dr. Conrad Berens, New York, read a paper on "Ocular Conditions Associated with Coliform Bacteria: Certain Clinical and Experimental Considerations of Infections of the Upper Respiratory Tract with Coliform Bacteria." Discussed by Drs. Peter C. Kronfeld, Chicago; John A. Toomey, Cleveland, and Conrad Berens, New York.

Dr. David O. Harrington, San Francisco, read a paper on "Tonometric Standardization: A Contribution to the Accuracy of Tonometry Through a Method of Reducing Its Variables to Constants and Minimizing Its Errors Through Refinement and Standardization of the Tonometer." Discussed by Drs. Jonas S. Friedenwald, Baltimore; T. L. Terry, Boston, and David O. Harrington, San Francisco.

Demonstration Session

Dr. David O. Harrington, San Francisco, gave a demonstration of the tonometer.

Dr. Samuel G. Higgins, Milwaukee, gave a lantern demonstration of the corneal scleral sutures.

Executive Session

Dr. Derrick Vail, Cincinnati, brought up the optometry problem and the question of rebates. He called to the attention of the members that a number of years ago the section went on record that it was considered unethical for any of its members to accept rebates in any way, shape or form; that the executive committee endorses this stand and considers the problem closed so far as the section is concerned and hereby gives notice that any individual will have to stand on his own merit.

Dr. Walter B. Lancaster, Hanover, N. H., reported for the subcommittee of the Committee (Joint) on Optics and Visual Physiology on the optometry problem.

It was voted, on motion by A. R. Irvine, Los Angeles, as amended by Dr. Arthur J. Bedell, Albany, N. Y., that the section recommend to the House of Delegates that the following resolution, adopted by the House of Delegates in 1935, be rescinded:

WHEREAS, There have been many complaints regarding the action of some ophthalmologists in giving lectures to and consulting with opticians and optometrists; and

WHEREAS, It is universally conceded that to care for the diseases and conditions of the human eye demands the unusual knowledge of a graduate physician who has been especially prepared; and

WHEREAS, The eye is an integral part of the body; and

WHEREAS, No one but a physician so trained should be permitted to diagnose, treat or prescribe for eye conditions; and

WHEREAS, Lecture, address or any other form of instruction to opticians and optometrists by ophthalmologists is not only a breach of the principles of medical ethics, which control our professional relationships, but is also to the detriment of the ocular health of the public by giving it a false sense of security; and

WHEREAS, General health and ocular comfort depend on the best medical care; therefore, be it

Resolved, That the Section on Ophthalmology of the American Medical Association declares that it is unethical for any member of the American Medical Association to give lectures or courses of instruction or to consult with any one not associated with the actual medical service; and be it further

Resolved, That the House of Delegates of the American Medical Association be asked to make a ruling to this effect.

FRIDAY, JUNE 6—AFTERNOON

Executive Session

The Research Medal Award was presented to Dr. Walter B. Lancaster, Hanover, N. H.

Dr. Harry S. Gradle, Chicago, presented the report of the Committee on Visual Economics as printed in the program, and, on motion, it was voted that the delegate of the section to the House of Delegates present it to the next meeting of the House of Delegates for adoption.

Dr. Derrick Vail, Cincinnati, read the report of the Committee on Knapp Testimonial Fund. The report was accepted.

Dr. Walter B. Lancaster, Hanover, N. H., read the report of the American Committee on Optics and Visual Physiology, with the following recommendations:

1. Your committee recommends lowering the standard for visual acuity for admittance to West Point to 20/30 without correction in each eye, provided that 20/20 or better is obtained in each eye with lenses. The test must be conducted under standard conditions. Your committee recommends the Landolt broken ring and at least 20 foot candles of illumination.

2. The committee approves the licensing of dispensing opticians and recommends that, in every state in which difficulty is encountered in having the dispensing opticians licensed separately, a plan be adopted whereby the dispensing opticians would be licensed by the board of medical examiners.

The report and recommendations were approved.

Dr. Walter B. Lancaster, Hanover, N. H., reported that the Committee on Awarding the Knapp Medal voted to make no award this year.

Dr. S. Judd Beach, Portland, Maine, read the report of the American Board of Ophthalmology, which was accepted.

Dr. Derrick Vail, Cincinnati, read the report of the Committee on National Museum of Ophthalmic Pathology. The report was accepted.

Dr. Derrick Vail, Cincinnati, read the report of the Committee on Scientific Exhibit, which was accepted.

Dr. Arthur J. Bedell, Albany, N. Y., reported as delegate of the section to the House of Delegates.

Dr. Derrick Vail, Cincinnati, read the report of the Committee on Museum of Ophthalmic History, which was accepted.

Dr. George Guibor, Ottawa, Ill., read the report of the Committee on Orthoptics. The report was accepted.

Dr. Harry Gradle, Chicago, read the report of the Advisory Committee to the Eye Health Committee of the American Student Health Association. The report was accepted with the amendment deleting the words "and conditions of ocular health."

Dr. T. L. Terry, Boston, reported that the Ophthalmic Literature Committee wished to continue seeking the proper time and method of introducing comprehensive ophthalmic abstracts of the international literature and had no recommendations at present. The report was accepted.

Dr. S. Judd Beach, Portland, Maine, reported for the Committee on Conservation and Prevention of Blindness.

The following officers were elected: chairman, Dr. Lawrence T. Post, St. Louis; vice chairman, Dr. W. R. Buffington, New Orleans.

The following committee appointments were recommended by the executive committee and approved:

To fill vacancy on the Committee on American Board of Ophthalmology, the reelection of Dr. Daniel B. Kirby, New York, to serve for a term of four years.

The reelection of Dr. Walter B. Lancaster, Hanover, N. H., to the American Committee (Joint) on Optics and Visual Physiology, to serve for a term of three years.

The reelection of Dr. Jonas S. Friedenwald, Baltimore, to the Committee (Joint) on National Museum of Ophthalmic Pathology.

The reelection of Dr. Georgiana Dvorak Theobald, Oak Park, Ill., to fill the vacancy of chairman of the Committee for Scientific Exhibit from the Section. The appointment of Dr. Derrick Vail, Cincinnati, and Dr. W. Ivan Lillie, Philadelphia, to the committee.

The reelection of the present members to the Committee on Museum of Ophthalmic History.

The reelection of Dr. William L. Benedict, Rochester, Minn., to the Advisory Committee of Student Health Association.

The election of Dr. Frank D. Costenbader, Washington, D. C., to fill a vacancy of the Committee on American Orthoptic Council, to serve for three years.

The reappointment of the present members of the Committee on Ophthalmic Literature (Joint).

The formation of a Committee on Industrial Ophthalmology, to consist of the following members: Dr. Albert C. Snell, Rochester, N. Y., chairman; Dr. Hedwig S. Kuhn, Hammond, Ind., and Dr. Arthur M. Culler, Dayton, Ohio.

The election of Dr. Ralph O. Rychener, Memphis, Tenn., to fill a vacancy of the Committee on Visual Economics. The appointment of Dr. Alfred Cowan, Philadelphia, as chairman of the committee.

The election of Dr. William L. Benedict, Rochester, Minn., to the Council of the Pan American Congress representing the section.

The appointment of Dr. Thomas D. Allen, Chicago, to represent the section on the board of governors of the American College of Surgeons.

The following committee for awarding the Knapp Medal for 1941 was elected from the floor: Dr. Alfred Cowan, Philadelphia; Dr. Parker Heath, Detroit, and Dr. Clyde A. Clapp, Baltimore.

Scientific Session

Drs. Thomas D. Allen and Walter G. Ackerman, Chicago, presented a paper on "Hereditary Glaucoma in Three Generations of a Family." Discussed by Drs. Paul A. Chandler, Boston, and Thomas D. Allen, Chicago.

Dr. William Thornwall Davis, Washington, D. C., read a paper on "Superficial Punctate Parenchymatous Keratitis." Discussed by Drs. Sanford R. Gifford, Chicago; Trygve Gundersen, Boston, and William Thornwall Davis, Washington, D. C.

Dr. Loren Pritchard Guy, New York, read a paper on "Ocular Torticollis: Differential Diagnosis." Discussed by Drs. A. D. Ruedemann, Cleveland; Don Marshall, Kalamazoo, Mich.; Thomas D. Allen, Chicago; George Guibor, Ottawa, Ill., and Loren Pritchard Guy, New York.

Dr. James W. White, New York, read a paper on "Paralysis of the Superior Rectus and Inferior Oblique of the Same Eye." Discussed by Drs. John B. Hitz, Milwaukee; Walter B. Lancaster, Hanover, N. H.; Hermann M. Burian, Hanover, N. H., and James W. White, New York.

Dr. Hermann M. Burian, Hanover, N. H., read a paper on "Fusional Movements in Permanent Strabismus: A Study of the Role of the Central and Peripheral Retinal Regions in the Act of Binocular Vision in Squint." Discussed by Drs. Walter Henry Fink, Minneapolis, and Joseph I. Pascal, New York.

SECTION ON LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. LeRoy A. Schall, Boston.

Dr. Paul H. Holinger, Chicago, read a paper on "The Influence of Expectorants and Gases on Sputum and the Mucous Membranes of the Tracheobronchial Tree." Discussed by Dr. Henry G. Poncher, Chicago.

Dr. Ernest M. Seydell, Wichita, Kan., read a paper on "The Relation of Tonsillectomy to Poliomyelitis." Discussed by Drs. Harris P. Mosher, Marblehead, Mass., and T. E. Carmody, Denver.

Dr. W. E. Grove, Milwaukee, read a paper on "Problems of the Hard of Hearing in Industry." Discussed by Drs. Horace Newhart, Minneapolis, and C. H. McCaskey, Indianapolis.

Dr. Henry M. Goodyear, Cincinnati, read a paper on "The Use of Iodized Oil in the Treatment of Nasal Antrum Infections." Discussed by Drs. Arthur W. Proetz, St. Louis; O. E. Van Alyea, Chicago; Paul M. Moore Jr., Cleveland; Theodore E. Walsh, St. Louis; Frank R. Spencer, Boulder, Colo., and Henry M. Goodyear, Cincinnati.

Executive Session

On motion by Dr. Frank R. Spencer, Boulder, Colo., seconded by Dr. Arthur W. Proetz, St. Louis, the application of Dr. Avery S. Krashen, D.D.S., of 8 South Michigan Avenue, Chicago, for associate membership in the section was approved.

THURSDAY, JUNE 5—MORNING

Dr. LeRoy A. Schall, Boston, read the chairman's address, entitled "The Treatment of Staphylococcic Cavernous Sinus Thrombophlebitis."

Dr. William D. Province, New York, read a paper on "Principles of Chemotherapy." Discussed by Drs. George E. Shambaugh Jr., Chicago; Edward D. King, Cincinnati; Frank R. Spencer, Boulder, Colo.; Robert H. Fraser, Battle Creek, Mich., and William D. Province, New York.

Dr. M. M. Cullom, Nashville, Tenn., read a paper on "Ozena." Discussed by Drs. Joseph C. Beck, Chicago; J. Milton Robb, Detroit; Fletcher D. Woodward, Charlottesville, Va.; William S. Van Fossen, Columbus, Ohio; Gerald M. Koepcke, Minneapolis, and M. M. Cullom, Nashville, Tenn.

Dr. French K. Hansel, St. Louis, read a paper on "Atypical Nasal Allergy."

Drs. Fletcher D. Woodward and Oscar Swineford Jr., Charlottesville, Va., read a paper on "The Relationship of Otolaryngology to Allergy."

These two papers were discussed by Drs. Grafton Tyler Brown, Washington, D. C.; J. Alexander Clarke Jr., Philadelphia; George Piness, Los Angeles; French K. Hansel, St. Louis, and Oscar Swineford Jr., Charlottesville, Va.

Drs. F. E. LeJeune and P. J. Bayon, New Orleans, presented a paper on "Acute Laryngotracheobronchitis." Discussed by Drs. Henry B. Orton, Newark, N. J.; Louis H. Clerf, Philadelphia; Frank R. Spencer, Boulder, Colo., and F. E. LeJeune, New Orleans.

FRIDAY, JUNE 6—MORNING

Executive Session

The following officers were elected: chairman, Dr. Gordon F. Harkness, Davenport, Iowa; vice chairman, Dr. Daniel S. Cuning, New York; secretary, Dr. Louis H. Clerf, Philadelphia; executive committee: Dr. Arthur W. Proetz, St. Louis; Dr. LeRoy A. Schall, Boston, and Dr. Gordon Harkness, Davenport, Iowa; delegate, Dr. Burt R. Shurly, Detroit; alternate, Dr. Gordon F. Harkness, Davenport, Iowa.

Dr. John J. Shea, Memphis, Tenn., and Dr. Joseph C. Beck, Chicago, reported for the Board of Otolaryngology that 3,181 men had been certified by the board to date, and that two examinations had been held this year, both in Cleveland, 84 being certified at the examination last week.

Dr. Chevalier L. Jackson, Philadelphia, chairman of the Committee on Lye Legislation, reported that the committee still was active and that a formal report would be presented next year.

Scientific Session

Dr. A. C. Furstenberg, Ann Arbor, Mich., read a paper on "Diseases of the Salivary Glands." Discussed by Drs. Walter B. Hoover, Boston; Gordon B. New, Rochester, Minn., and A. C. Furstenberg, Ann Arbor, Mich.

Dr. Louis Hubert, New York, read a paper on "Thrombosis of the Lateral Sinus: An Analysis of Results Obtained in One Hundred and Nineteen Cases." Discussed by Drs. George M. Coates, Philadelphia; Fred W. Dixon, Cleveland, and Louis Hubert, New York.

Drs. Ralph Adams and Lowry F. Davenport, Boston, presented a paper on "The Technic of Bronchography and a System of Bronchial Nomenclature." Discussed by Drs. Chevalier L. Jackson, Philadelphia; Louis H. Clerf, Philadelphia, and Ralph Adams, Boston.

Dr. Theodore E. Walsh, St. Louis, read a paper on "Prophylaxis of the Common Cold." Discussed by Drs. John J. Shea, Memphis, Tenn.; Walter B. Hoover, Boston; Sylvester C. Missal, Cleveland, and Theodore E. Walsh, St. Louis.

Dr. George D. Wolf, New York, read a paper on "Rhino-plasty and Its Relation to Rhinology." Discussed by Drs. Samuel Salinger, Chicago; Vilray P. Blair, St. Louis; Myron F. Metzenbaum, Cleveland, and George D. Wolf, New York.

SECTION ON PEDIATRICS

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2:05 by the chairman, Dr. Julius H. Hess, Chicago.

Dr. John Dorsey Craig, New York, read a paper on "Prognosis of Acute Hemorrhagic Nephritis in Children." Discussed by Dr. Jerome L. Kohn, New York.

Dr. Bernard Gumbiner, Chicago, read a paper on "Spontaneous Pneumomediastinum of the Newborn Infant." Discussed by Dr. C. C. Macklin, London, Ont.

Dr. H. Jerry Lavender, Cincinnati, read a paper on "Burns in Children: Analysis of Two Hundred and Fifty Cases." Discussed by Drs. R. H. Aldrich, Boston; Adalbert G. Bettman, Portland, Ore., and H. Jerry Lavender, Cincinnati.

Drs. J. M. Lewis, Oscar Bodansky and Charles Haig, New York, presented a paper on "Evaluation of Vitamin A Blood Level as an Indicator of Vitamin A Deficiency in Infants and in Children." Discussed by Drs. Arthur F. Abt, Chicago, and J. M. Lewis, New York.

Dr. Oscar Reiss, Los Angeles, chairman of the resolutions committee, presented a resolution expressing the appreciation of the section to the officers of the Association for their efforts in the recent trial of the American Medical Association in a District of Columbia court.

Dr. Alexander T. Martin, New York, read a paper on "Twenty Years' Observation on 1,438 Children with Rheumatic Heart Disease." Discussed by Drs. William D. Stroud, Philadelphia; A. L. Van Horn, Washington, D. C.; George J. Feldstein, Pittsburgh; T. Duckett Jones, Boston, and Joseph T. Roberts, Galveston, Texas.

Drs. L. M. Tocantins, James F. O'Neill and Harold W. Jones, Philadelphia, presented a paper on "The Intramedullary Route for the Parenteral Administration of Blood and Other Fluids."

Drs. George B. Logan and Edward J. Baldes, Rochester, Minn., presented a paper on "Parallel Clinical and Electroencephalographic Improvement in Epilepsy: A Study of Children Treated by the Ketogenic Diet."

THURSDAY, JUNE 5—AFTERNOON

The following officers were elected: chairman, Dr. Phillip M. Stimson, New York; vice chairman, Dr. Oscar Reiss, Los Angeles; secretary, Dr. Hugh L. Dwyer, Kansas City, Mo.; delegate, Dr. William Weston, Columbia, S. C.; alternate, Dr. Julius H. Hess, Chicago (to fill the unexpired term of Dr. A. Graeme Mitchell, deceased); executive committee: Dr. William Weston, Columbia, S. C. (to serve the unexpired term of Dr. Edward Clay Mitchell, Memphis, Tenn., during the 1941 session, who was absent on account of illness); representative in charge of the scientific exhibit, Dr. Arthur F. Abt, Chicago; secretary-treasurer of the Abraham Jacobi Fund, Dr. Hugh L. Dwyer, Kansas City, Mo.

The secretary-treasurer of the Abraham Jacobi Fund read his report.

A communication was read from the American Board of Pediatrics relative to the examination of candidates for certification to this board.

Dr. Julius H. Hess, Chicago, read the chairman's address, entitled "The Pediatrician: His Obligation to the State in Peace and War."

The following papers were read in a Panel Discussion on "Endocrine Disorders of Adolescence":

Dr. E. Kost Shelton, Los Angeles: "Preadolescent Hypothyroidism."

Dr. Roger L. J. Kennedy, Rochester, Minn.: "Hyperthyroidism in Childhood."

Dr. A. Wilmot Jacobsen, Buffalo: "Endocrine Factors Influencing Growth."

Dr. Emil Novak, Baltimore: "Gynecologic Problems of Adolescence."

Dr. Ralph H. Kunstadter, Chicago: "Adiposogenital Dys-trophies."

Dr. Willard O. Thompson, Chicago: "Endocrine Treatment of Cryptorchism."

Dr. Richard L. Sutton Jr., Kansas City, Mo.: "Acne of Adolescence."

These seven papers were discussed by Drs. Theodore O. Elterich, Pittsburgh, and E. Perry McCullagh, Cleveland.

Following the presentation of these papers and formal discussion, questions were submitted by the members of the section and answered by the particular member of the panel to whom they were directed.

FRIDAY, JUNE 6—AFTERNOON

A joint meeting was held with the Section on Preventive and Industrial Medicine and Public Health. The proceedings are reported in the minutes of that section.

SECTION ON PHARMACOLOGY AND THERAPEUTICS

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2:05 by the chairman, Dr. C. M. Gruber, Philadelphia.

Dr. David Ayman, Boston, read a paper on "Blood Pressure Determinations of Patients with Hypertension."

Drs. M. Herbert Barker and Howard A. Lindberg, Chicago, and Maurice H. Wald, Winnetka, Ill., presented a paper on "Treatment of Hypertension with Potassium Thiocyanate."

These two papers were discussed by Drs. John R. Williams, Winston-Salem, N. C., and David Ayman, Boston.

Dr. Julian M. Ruffin, Durham, N. C., read a paper on "Diagnosis and Treatment of Mild Vitamin Deficiencies."

Dr. Norman H. Jolliffe, New York, read a paper on "Treatment of Neurologic Disorders with Vitamins."

These two papers were discussed by Drs. F. P. Moersch, Rochester, Minn.; I. S. Wechsler, New York; C. A. Mills, Cincinnati; Meyer A. Zeligs, Cincinnati; Leon Schiff, Cincinnati; Thomas T. Mackie, New York, and Norman H. Jolliffe, New York.

Dr. Edward F. Hartung, New York, read a paper on "Treatment of Rheumatoid Arthritis with Gold Salts: Possible Mode of Action." Discussed by Drs. Charles H. Slocumb, Rochester, Minn.; Russell L. Cecil, New York; Richard H. Freyberg, Ann Arbor, Mich.; H. M. Margolis, Pittsburgh; C. M. Gruber, Philadelphia, and Edward F. Hartung, New York.

Drs. Francis D. Murphy and Bruno J. Pietraszewski, Milwaukee, presented a paper on "Acute Nephritis, with Special Reference to the Recognition and Treatment of the Early Phases and the Outcome Ten Years Later in Eighty-Nine Cases." Discussed by Drs. N. M. Keith, Rochester, Minn., and Moses Barron, Minneapolis.

Drs. W. H. Feldman and H. C. Hinshaw, Rochester, Minn., presented a paper on "Therapeutic Effect of Sodium P, P'-Diamino-Diphenyl-Sulfone-N-N'-Didextrose Sulfonate (Promin) in Experimental Tuberculosis." Discussed by Dr. J. Arthur Myers, Minneapolis.

THURSDAY, JUNE 5—AFTERNOON

The following officers were elected: chairman, Dr. Wallace M. Yater, Washington, D. C.; vice chairman, Dr. Tinsley R. Harrison, Winston-Salem, N. C.; secretary, Dr. Edgar V. Allen, Rochester, Minn.; delegate, Dr. O. P. J. Falk, St. Louis; alternate, Dr. George R. Herrmann, Galveston, Texas; in charge of exhibits, Dr. Dwight L. Wilbur, San Francisco; executive committee: Drs. Irving S. Wright, New York; C. M. Gruber, Philadelphia, and Wallace M. Yater, Washington, D. C.

The chairman read a report from Dr. O. P. J. Falk, St. Louis, delegate of the section to the House of Delegates, announcing the amendment of the By-Laws of the American Medical Association, changing the name of the Section on Pharmacology and Therapeutics to the Section on Experimental Medicine and Therapeutics.

Dr. C. M. Gruber, Philadelphia, read the chairman's address, entitled "Some Differences in Actions of the Barbiturates and Thiobarbiturates When Administered to Man and Experimental Animals."

Drs. N. M. Keith, A. E. Osterberg and H. B. Burchell, Rochester, Minn., presented a paper on "Some Effects of Potassium Salts in Man." Discussed by Drs. M. Herbert Barker, Chicago; J. M. Hayman, Cleveland, and N. M. Keith, Rochester, Minn.

Dr. Edwin E. Osgood, Portland, Ore., read a paper on "Neosarsphenamine in the Therapy of Bacterial Infections." Discussed by Drs. Louis N. Katz, Chicago, and Edwin E. Osgood, Portland, Ore.

Drs. Adolph Sachs, Victor E. Levine and Agnes Schmit, Omaha, presented a paper on "Copper and Iron in Human Blood."

Dr. Ernest H. Falconer, San Francisco, read a paper on "Treatment of Polycythemia Vera with Lead Compounds."

These two papers were discussed by Drs. Carl V. Moore, St. Louis; Howard L. Alt, Chicago; William Dameshek, Boston; Adolph Sachs, Omaha, and Ernest H. Falconer, San Francisco.

Drs. James A. Greene and L. W. Swanson, Iowa City, presented a paper on "The Utilization and Effect of Added Dextrose in Cases of Controlled and Uncontrolled Diabetes." Discussed by Drs. H. O. Mosenthal, New York, and David Adlersberg, New York.

Drs. Udall J. Salmon and Robert I. Walter, New York, presented a paper on "Treatment of the Menopause: Evaluation of Estrogen Implantation."

FRIDAY, JUNE 6—MORNING

A joint meeting was held with the Section on Practice of Medicine. The proceedings are reported in the minutes of that section.

SECTION ON PATHOLOGY AND PHYSIOLOGY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9:15 by the chairman, Dr. Carl J. Wiggers, Cleveland.

Dr. Carl J. Wiggers, Cleveland, read the chairman's address, entitled "The Applicability of Experimental Results to the Shock Problem in Man."

The following papers were read as a symposium on "physiology":

Dr. William H. Howell, Baltimore: "Recent Advances in the Problem of Blood Coagulation Applicable to Medicine."

Dr. Andrew C. Ivy, Chicago: "The Applied Physiology of Bile Secretion and Bile Salt Therapy."

Dr. Frank C. Mann, Rochester, Minn.: "The Liver and Medical Progress."

Dr. Frank A. Hartman, Columbus, Ohio: "The Adrenal Hormones in Medical Practice."

Dr. John F. Fulton, New Haven, Conn.: "Cerebral Function in Aviation."

Dr. Hallowell Davis, Boston: "Contributions of Physiology to Medicine: Electroencephalography."

THURSDAY, JUNE 5—MORNING

Dr. Howard W. Jones, Baltimore, read a paper on "Further Studies on Mesonephroma of the Ovary." Discussed by Drs. Walter Schiller, Chicago; Emil Novak, Baltimore, and Howard T. Karsner, Cleveland.

Drs. Frank R. Menne and Melvin W. Anderson, Portland, Ore., presented a paper on "Bronchiogenic Carcinoma: Its Incidence in the Pacific Northwest Together with a Commentary on Eighty-Four Instances." Discussed by Drs. Howard T. Karsner, Cleveland; Bela Halpert, New Orleans; L. Wallace Frank, Louisville, Ky.; Israel Davidsohn, Chicago, and Frank R. Menne, Portland, Ore.

Dr. J. Shelton Horsley, Richmond, Va., read a paper on "Carcinoma of the Jejunum and Ileum." Discussed by Dr. Fred W. Rankin, Lexington, Ky.

Drs. Newton G. Evans and Albert F. Brown, Los Angeles, presented a paper on "Carcinoma of the Prostate: Relation between Histopathology and Clinical Course." Discussed by Drs. Israel Davidsohn, Chicago; Walter Schiller, Chicago; Roger W. Barnes, Los Angeles, and Newton G. Evans, Los Angeles.

Dr. Robert B. Greenblatt, Augusta, Ga., read a paper on "Histologic Changes in the Ovary Following Administration of Gonadotropin." Discussed by Drs. Frank W. Konzelmann, Philadelphia; Walter Schiller, Chicago; Udall J. Salmon, New York; Emil Novak, Baltimore, and Robert B. Greenblatt, Augusta, Ga.

A nominating committee was appointed, consisting of Drs. Frank W. Konzelmann, Philadelphia; John Paul Quigley, Ph.D., Cleveland, and Benjamin T. Terry, Tacoma, Wash.

FRIDAY, JUNE 6—MORNING

The following officers were elected: chairman, J. P. Simonds, Chicago; vice chairman, Frank C. Mann, Rochester, Minn.; secretary, J. J. Moore, Chicago; delegate, L. W. Larson, Bismarck, N. D.; alternate, J. J. Moore, Chicago; executive committee: Drs. Frank W. Hartman, Detroit; Carl J. Wiggers, Cleveland, and J. P. Simonds, Chicago.

Dr. L. W. Larson, Bismarck, N. D., delegate of the section to the House of Delegates, submitted his report dealing principally with the professional standing of pathologists in hospitals. On motion by Dr. Larson, the chairman of the section was authorized, by unanimous vote, to appoint a committee on industrial health to cooperate with the Council on Industrial Health.

Dr. J. M. Hill, Dallas, Texas, read a paper on "The Advantages and Clinical Uses of Desiccated Plasma Prepared by the Adtevac Process." Discussed by Drs. Harold W. Jones, Philadelphia; Carl J. Wiggers, Cleveland; J. Shelton Horsley, Richmond, Va.; Frank W. Konzelmann, Philadelphia, and J. M. Hill, Dallas, Texas.

Drs. M. Laurence Montgomery, San Francisco, and I. L. Chaikoff, Berkeley, Calif., presented a paper on "The Role of the External Secretion of the Pancreas in the Prevention of Fatty Infiltration of the Liver." Discussed by Drs. Lester R. Dragstedt, Chicago, and M. Laurence Montgomery, San Francisco.

Drs. M. A. Spellberg and Robert W. Keeton, Chicago, presented a paper on "Dietary Production of Fatty and Cirrhotic Livers, with a Study of the Specific Factor Involved." Discussed by Drs. Thomas E. Machella, Philadelphia; M. Laurence Montgomery, San Francisco; Virgil H. Moon, Philadelphia; J. P. Simonds, Chicago, and M. A. Spellberg, Chicago.

Drs. Henry N. Harkins, Detroit; C. Frank Chunn, Vicksburg, Miss., and Robert T. Boals, Detroit, presented a paper on "Alimentary Azotemia and the Bleeding Peptic Ulcer Syndrome." Discussed by Drs. D. H. Kaump, Detroit; Leon Schiff, Cincinnati; Walter L. Palmer, Chicago; Reuben Friedman, Philadelphia, and Henry N. Harkins, Detroit.

Drs. William Dameshek and Edward B. Miller, Boston, presented a paper on "The Pathogenesis of Hemolytic Anemia." Discussed by Drs. Russell L. Haden, Cleveland, and William Dameshek, Boston.

Drs. H. J. Corper and Maurice L. Cohn, Denver, presented a paper on "A Concrete Classic Demonstration of Two Separate Specific Immune Phenomena in Tuberculosis."

Drs. G. E. Wakerlin and C. A. Johnson, Chicago, presented a paper on "Reductions in Blood Pressures of Renal Hypertensive Dogs by Hog Renin." Discussed by Drs. Harry Goldblatt, Cleveland; Louis N. Katz, Chicago; John R. Williams, Winston-Salem, N. C., and G. E. Wakerlin, Chicago.

Drs. Charles F. Geschickter, Baltimore, and Elizabeth W. Byrnes, East Orange, N. J., presented a paper on "Factors Influencing Estrogenic Mammary Cancer in the Rat in Response to Estrogen."

SECTION ON NERVOUS AND MENTAL DISEASES

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 9 o'clock by the chairman, Dr. Tom B. Throckmorton, Des Moines, Iowa.

Drs. Leo Alexander, Merrill Moore and Abraham Myerson, Boston, presented a paper on "Alcohol and the Food, Drug and Cosmetic Act: A Proposal for Changes in Present Methods of Sale of Alcoholic Beverages to Conform with the Federal Food, Drug and Cosmetic Act." Discussed by Drs. Philip E. Piker, Cincinnati; Lawrence Kolb, Washington, D. C.; Theodore G. Klumpp, Washington, D. C., and Merrill Moore, Boston.

Dr. F. Garm Norbury, Jacksonville, Ill., read a paper on "Some Mental Mechanisms in Alcoholism." Discussed by Drs. Lloyd H. Ziegler, Wauwatosa, Wis.; G. Wilse Robinson Jr., Kansas City, Mo.; Theodore Diller, Pittsburgh; Robert V. Seliger, Baltimore, and F. Garm Norbury.

Dr. Tom B. Throckmorton, Des Moines, Iowa, read the chairman's address, entitled "Francis X. Dercum."

Drs. S. Bernard Wortis and Lewis I. Sharp, New York, presented a paper on "Fractures of the Spine with Spinal Cord Injury." Discussed by Drs. F. C. Grant, Philadelphia; Lewis J. Pollock, Chicago; Emil Seletez, Los Angeles, and S. Bernard Wortis, New York.

Drs. Maurice H. Greenhill, Durham, N. C., and Jacob E. Finesinger, Boston, presented a paper on "An Evaluation of Emotional Factors in Neurodermatitis." Discussed by Drs. Samuel W. Becker, Chicago; Marion B. Sulzberger, New York, and Maurice H. Greenhill, Durham, N. C.

Dr. C. Hunter Shelden, Pasadena, Calif., read a paper on "Neuromuscular Disorders: Results of Vitamin E Therapy."

Dr. Russell N. DeJong, Ann Arbor, Mich., read a paper on "Vitamin E and Alpha-Tocopherol Therapy in Neuromuscular and Muscular Disorders."

These two papers were discussed by Drs. F. P. Moersch, Rochester, Minn.; I. S. Wechsler, New York; S. Bernard Wortis, New York; Henry R. Viets, Boston; C. Hunter Shelden, Pasadena, Calif., and Russell N. DeJong, Ann Arbor, Mich.

THURSDAY, JUNE 5—AFTERNOON

Panel discussion on "Neurosurgical Treatment of Certain Abnormal Mental States" was participated in by Drs. Paul C. Bucy, Chicago, moderator; Walter Freeman, Washington, D. C.; M. A. Tarumianz, Farnhurst, Del.; Theodore Charles Erickson, Montreal; J. G. Lyerly, Jacksonville, Fla.; H. D. Palmer, Philadelphia, and Roy R. Grinker, Chicago.

FRIDAY, JUNE 6—AFTERNOON

The following officers were elected: chairman, Stanley Cobb, Boston; vice chairman, A. R. Vonderahe, Cincinnati; secretary, Johannes M. Nielsen, Los Angeles; executive committee: Paul C. Bucy, Chicago; Tom B. Throckmorton, Des Moines, Iowa, and Stanley Cobb, Boston; delegate, Henry R. Viets, Boston; alternate, R. P. Mackay, Chicago; representative to American Board of Psychiatry and Neurology, Walter Freeman, Washington, D. C.; representative to Scientific Exhibit, F. P. Moersch, Rochester, Minn.

Dr. Walter Freeman, Washington, D. C., gave a report from the American Board of Psychiatry and Neurology, reporting one thousand, one hundred and forty diplomates. The report was received and placed on file.

The report of Dr. Paul C. Bucy, Chicago, as representative of the section on the American Board of Neurological Surgery was read by Johannes M. Nielsen, Los Angeles, and placed on file.

Dr. F. P. Moersch, Rochester, Minn., gave his report as representative of the section on the Council on Scientific Exhibits.

The report of Dr. Henry R. Viets, Boston, delegate, was read by Dr. Johannes M. Nielsen, Los Angeles, and was placed on file.

The section adopted the following resolution:

WHEREAS, The Council on Industrial Health of the American Medical Association has recently developed close working relationship with some of the sections in the Scientific Assembly; and

WHEREAS, The advantages arising out of such association have already become apparent; and

WHEREAS, Problems relating to industrial practice are arising in the field of neurology and psychiatry; therefore be it

Resolved, That the Section on Nervous and Mental Diseases endorses the work of the Council on Industrial Health and hereby extends aid to it by creating a committee whose representative or representatives, appointed by the chairman of this section for a term of one year, shall work with said Council in an endeavor to solve the problems of industrial medicine arising within the province of neurology and psychiatry.

Dr. Irving J. Sands, Brooklyn, read a paper on "The Diagnosis and Management of Subarachnoid Hemorrhage." Discussed by Drs. Siegfried Baumoe, Cleveland, and Irving J. Sands, Brooklyn.

Dr. Howard D. Fabing, Cincinnati, read a paper on "Induction of Metrazol Convulsions Under Nitrous Oxide Anesthesia." Discussed by Drs. Philip E. Piker, Cincinnati; A. E. Bennett, Omaha; Harold E. Himwich, Albany, N. Y., and Howard D. Fabing, Cincinnati.

Dr. Erich Liebert, Elgin, Ill., read a paper on "Spontaneous Convulsions Following Metrazol Treatment." Discussed by Drs. Roy R. Grinker, Chicago, and Erich Liebert, Elgin, Ill.

Dr. David John Impastato, New York, read a paper on "Electrically Induced Convulsions in the Treatment of Functional Disorders." Discussed by Drs. Walter Freeman, Washington, D. C.; J. L. Fetterman, Cleveland; Eugene Ziskind, Los Angeles; Irving J. Sands, Brooklyn, and David John Impastato, New York.

Dr. Frederic A. Gibbs, Boston, read a paper on "Diagnostic and Prognostic Value of the Electroencephalogram." Discussed by Drs. Edward J. Baldes, Rochester, Minn.; M. M. Miller, Cleveland, and Frederic A. Gibbs, Boston.

Dr. Irving Simons, New York, read a paper on "Microcystometry and Sphincterometry in the Study and Treatment of Neurologic Diseases." Discussed by Drs. E. L. Brodie, Buffalo, and Irving Simons, New York.

SECTION ON DERMATOLOGY AND SYPHILOLOGY

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2:10 by the chairman, Dr. J. Gardner Hopkins, New York.

Dr. Edward A. Oliver, Chicago, read the following resolution, to be laid before the Committee on Medical Preparedness of the American Medical Association:

Resolved, 1. That separate services for the specialties recognized by the American Medical Association and by the National Boards for the Medical Specialties should be organized and maintained in the Medical Corps in the Army and Navy. 2. That in all military and naval hospitals of sufficient size and permanence to warrant special departments, adequate physical facilities, equipment and personnel be made available for the proper practice of each specialty indicated. 3. That the chief of each special department should, if possible, be a medical officer holding a certificate from the appropriate national board in the specialty. 4. That the national boards for the various specialties be asked to study the facilities to be made available in military and naval hospitals, with the view of giving credit to junior medical officers for the time spent in these departments.

On motion by Dr. Howard Morrow, San Francisco, seconded by Dr. Joseph V. Klauder, Philadelphia, the resolution was adopted.

On motion by Dr. Harry M. Robinson, Baltimore, duly seconded and carried, it was voted to grant the privilege of the floor to Dr. Robert Brandt, formerly of Vienna and now of Cincinnati.

Dr. J. Gardner Hopkins, New York, read the chairman's address, entitled "The Education of a Dermatologist."

Drs. John H. Lamb and William E. Eastland, Oklahoma City, presented a paper on "Cancer of the Lower Lip: Treatment by Radiation." Discussed by Drs. James R. Driver, Cleveland; John W. Spellman, Brookline, Mass.; H. J. Templeton, Oakland, Calif., and John H. Lamb, Oklahoma City.

Drs. A. Benson Cannon and Marie B. Karelitz-Karry, New York, presented a paper on "Poikiloderma-like Changes in the Skin Following Arsphenamine Dermatitis: Report of Two Cases." Discussed by Drs. Clyde L. Cummer, Cleveland; John

E. Rauschkolb, Cleveland; Maurice Oppenheim, Chicago, and A. Benson Cannon, New York.

Drs. Francis A. Ellis, Baltimore, and Hayden Kirby-Smith, Washington, D. C., presented a paper on "A Comparative Study of Necrobiosis Lipoidica and Granuloma Annulare." Discussed by Drs. Fred D. Weidman, Philadelphia; Hamilton Montgomery, Rochester, Minn.; F. J. Eichenlaub, Washington, D. C., and Francis A. Ellis, Baltimore.

Drs. Harry M. Robinson and Harry M. Robinson Jr., Baltimore, presented a paper on "Comparison of Frei Antigens." Discussed by Drs. Herman Beerman, Philadelphia; Robert Brandt, Cincinnati; Morris J. Strauss, New Haven, Conn.; Arthur W. Grace, New York, and Harry M. Robinson, Baltimore.

Drs. Francis W. Lynch, St. Paul, and Ruth E. Boynton and Anne C. Kimball, Minneapolis, presented a paper on "False Positive Serologic Reactions for Syphilis Due to Smallpox Vaccination." Discussed by Drs. Francis E. Seneor, Chicago; Benjamin S. Kline, Cleveland; Adolph B. Loveman, Louisville, Ky.; Charles R. Rein, New York; Arthur G. Schoch, Dallas, Texas, and Francis W. Lynch, St. Paul.

Drs. Frances M. Keddie, R. B. Rees Jr. and Norman N. Epstein, San Francisco, presented a paper on "Herpes Simplex Following Artificial Fever Therapy: Smallpox Vaccination as a Factor in Its Prevention." Discussed by Drs. Arthur G. Schoch, Dallas, Texas; Marion B. Sulzberger, New York; Roy Kile, Cincinnati; Everett Seale, Houston, Texas, and Norman N. Epstein, San Francisco.

THURSDAY, JUNE 5—AFTERNOON

Dr. Hamilton Montgomery, Rochester, Minn., representative to the Scientific Exhibit from the Section on Dermatology and Syphilology, presented the report of the committee as follows:

It was decided to continue with the joint motion picture exhibit. Owing to the necessity of combining motion picture exhibits with those of other sections, the exhibit of Dr. John H. Lamb, Oklahoma City, on Treatment of Cancer of the Lower Lip by Interstitial Radiation was separated from the dermatologic exhibit and put with other movies on cancer. I regret that it was necessary to turn down several applications for exhibits this year. Space for exhibits was a third less than that available at the New York meeting.

I wish to express my appreciation for the cooperation of the exhibitors in the section and joint motion picture exhibit and also to Dr. Thomas G. Hull for his usual splendid cooperation.

Our bank account, because of the usual donation from the American Medical Association of \$25 a year for expenses and as the result of decrease in correspondence and expenses regarding editing of motion picture films, is \$88.73 as compared to \$84.53 last year.

Dr. John G. Downing, Boston, presented the report of the Committee on Occupational Dermatoses as follows:

The Committee on Industrial Dermatoses has held three meetings since the last American Medical Association meeting.

The first meeting was held in Chicago in December at the time of the academy meeting, with Dr. S. J. Seeger, the chairman, and Dr. Carl M. Peterson, the secretary of the Council on Industrial Health. Suggestions for cooperation with the Council were discussed. The definition of an occupational dermatosis worked out by the committee was reviewed. It was agreed that a plan should be developed for recording with the Council reports of unusual cases or groups of cases of industrial dermatoses. Such cases will be reviewed by a subcommittee of this committee, and acceptable cases will be filed with the Council acting as a permanent depository for such information. The teaching of occupational dermatoses in medical schools, consultants in industrial dermatoses, primary skin irritants and other subjects were also discussed. A Subcommittee on Primary Skin Irritants was appointed. This meeting was so successful from the Council's point of view that this setup will be used as a model for cooperation with other sections of the American Medical Association in the field of industrial medicine.

It is worth while pointing out at this time that the Council has outlined the activities of these section committees as follows:

1. To promote greater utilization of the services of established specialties in industry.

2. To clarify the relationships in industry between the clinical specialist and the employer, employee and physician in industry.
3. To develop a central clearing house of information covering industrial health problems encountered by clinical specialists.
4. To consider and publicize proper terminology.
5. To emphasize the necessity of incorporating pertinent industrial material in training and certification for specialty practice.
6. To review periodically significant developments in workmen's compensation and medicoinurance relationships.
7. To improve in all other necessary ways general standards of medical accomplishment in industry and in workmen's compensation procedure.

Two issues of an Industrial Dermatoses Bulletin have already appeared. These bulletins provide for the discussion of questions in this field among members of the committee and the Council. Results of these discussions will appear at intervals in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION*.

In April, at the American Dermatological Association meeting in New Orleans, another meeting was held. The report of the Subcommittee on Primary Skin Irritants was presented, including a definition of a primary irritant. Much progress was made on the formulation of criteria for the diagnosis of industrial dermatoses. It was decided to send out a questionnaire on undergraduate and graduate teaching in industrial dermatology in the various medical schools. There was also discussion of the technic of handling case reports, medical testimony, the referring of questions on industrial dermatoses, and so on.

At the meeting of the committee on Wednesday morning, June 4, 1941, there was further discussion of the questionnaire on undergraduate teaching, and another draft of the criteria for the diagnosis of industrial dermatoses was considered. An interesting report of the Committee on Workmen's Compensation of the Society for the Study of Asthma and Allied Conditions was also discussed.

The Council on Industrial Health desires that there be a member of the committee in Chicago to provide closer cooperation with the Council. There is often a call for some one to state the reaction of the committee or to answer minor queries or to advise to whom a given question should be referred. The committee, therefore, recommends that Dr. Edward A. Oliver of Chicago be appointed a member of this committee.

In the increasing industrial activity in the present emergency it would seem that the work of the Council on Industrial Health will become of increasing importance. It can be assumed also that with so many individuals entering new jobs, with lack of training in cutaneous hazards and possible carelessness in handling materials there will be an increase in the number of cases of occupational dermatoses. The committee, therefore, plans to maintain the fullest cooperation with the Council in an attempt to provide for the early detection of cases, the proper interpretation of borderline conditions, and aid in prevention as far as possible.

Respectfully submitted.

C. GUY LANE, Chairman.
HARRY R. FOERSTER, Secretary.
CHARLES C. DENNIE.
JOHN G. DOWNING.
MARION B. SULZBERGER.

The chairman appointed the following committee to audit the books of the representative on Scientific Exhibit: Dr. Harold N. Cole, Cleveland; Dr. R. C. Jamieson, Detroit, and Dr. Loren W. Shaffer, Detroit.

Dr. Fred D. Weidman, Philadelphia, read the report of the American Board of Dermatology and Syphilology, as follows:

At the last meeting of the American Board of Dermatology and Syphilology in Chicago, Dec. 6 and 7, 1940, sixty-five candidates were examined. Of these, forty-five passed, twelve were conditioned and eight failed. Up to the present, five hundred and fifty-three diplomates of the Board have been certified.

At this meeting of the Board, Dr. Henry E. Michelson, Minneapolis, was elected to the Board as representative of the American Dermatological Association in place of Dr. Arthur

W. Stillians, Chicago, who retired, and Dr. Bedford Shelmire, Dallas, Texas, was elected as representative of the American Academy of Dermatology and Syphilology in place of Dr. Harold N. Cole, Cleveland, who retired.

In the last two years much progress has been made in the cooperative survey of graduate training facilities in Dermatology and Syphilology in this country. This survey has been made possible by the cooperation of the Council on Medical Education and Hospitals of the American Medical Association and this board. Sixty-six questionnaires were sent out to heads of dermatologic departments of the country. Questionnaires have been returned or replies received from all but eight institutions, so that a fair idea of the training of specialists in this field in this country has been obtained. The Board and Council have already approved twenty institutions as satisfactory for full three year training. There is, of course, considerable variation in these institutions in size, facilities, number of staff, new patients, total visits and so on. There is the variation in the clinical material, for example, in the number of new patients from almost 20,000 a year to a little over 1,000 a year, and a similar variation in total visits to the skin clinic from 114,000 down to 9,000 a year. In these twenty institutions, at the time the questionnaires were made out, there were one hundred and thirteen students in training in dermatology, and according to these questionnaires there were sixty-five places open each year. There are a few other institutions under consideration with reference to providing full three year training, but this is the situation as it stands at present.

The Board has under consideration the question of approving institutions for two year training and for one year training in the form of residencies, and there are about a dozen institutions now being reviewed by the Board and the Council with reference to classification in these groups. The number of students in the latter groups amount to twenty-five or thirty more, with perhaps twenty students accepted each year. Thus there are approximately one hundred and fifty students engaged in graduate training for the practice of dermatology and syphilology in these institutions which have been reviewed by the Board and the Council, and there are approximately eighty-five or ninety places open each year, according to these questionnaires.

The rush of requests for the sets of dermatologic histopathologic slides maintained by the Army Medical Museum makes it advisable that candidates who intend to take the next examination have their applications in the hands of the secretary of the Board as soon as possible and that application for the slides be made early in order that some of the candidates may not be deprived of the opportunity of using the slides just before the examination.

A new booklet has been published by the Board.

The next meeting of the Board will be held in New York on Dec. 12 and 13, 1941, during the time of the meeting of the American Academy of Dermatology and Syphilology.

At the recent meeting of the Board, held in April 1941 at New Orleans, the following five matters were decided on:

1. If a candidate is called into active military or naval service he will receive full credit for dermatologic training already finished at that time.
2. As far as counting as training in dermatology or syphilology any military or naval service, each case must of necessity be decided on the evidence submitted in the case of each particular candidate.
3. That the Board accept not more than one year of military service as part of the required two years experience in dermatology and syphilology to be eligible for examination.
4. A candidate who is called into military or naval service after completion of three years of training may take the complete examination of the Board, and that if this examination is satisfactory a certificate will be issued, after satisfactory completion of two years of further approved experience in dermatology and syphilology.
5. A candidate for a certificate may take the written examination at the next regular examination of the Board after he has completed three full years of training.

C. GUY LANE, Secretary.

Dr. Harold N. Cole, Cleveland, reported for the Auditing Committee that the financial statement of the Representative on Scientific Exhibit had been examined and found correct.

Dr. Fred D. Weidman, Philadelphia, placed in nomination Dr. Paul O'Leary, Rochester, Minn., to succeed himself on the American Board of Dermatology and Syphilology.

On motion by Dr. Marion B. Sulzberger, New York, duly seconded, it was voted that the number of members on the Committee on Industrial Dermatoses be increased from five to six, as recommended in the report of that committee, and that Dr. Edward A. Oliver, Chicago, be appointed the sixth member.

Drs. Robert R. Kierland and Paul A. O'Leary, Rochester, Minn., presented a paper on "Intraspinal Therapy of Neurosyphilis." Discussed by Drs. Harold N. Cole, Cleveland; Harry M. Robinson, Baltimore; Samuel W. Becker, Chicago; A. Benson Cannon, New York, and Robert R. Kierland, Rochester, Minn.

Drs. William Leifer, Louis Chargin and Harold Thomas Hyman, New York, presented a paper on "Massive Dose Arsenotherapy in Early Syphilis by the Continuous Intravenous Drip Method."

Drs. David C. Elliott, Chicago; George Baehr, New York; Loren W. Shaffer, Detroit; Glenn S. Usher and S. Allan Lough, Washington, D. C., presented a paper on "An Evaluation of the Massive Dose Therapy of Early Syphilis."

These two papers were discussed by Drs. Evan W. Thomas, New York; Herbert Rattner, Chicago; George Baehr, New York; W. F. Spiller, Galveston, Texas; Maurice J. Strauss, New Haven, Conn.; Joseph F. Sadusk Jr., New Haven, Conn.; Samuel Goldblatt, Cincinnati; Arthur G. Schoch, Dallas, Texas; Leon Bromberg, St. Louis; Ira L. Schamberg, Ann Arbor, Mich.; Marion B. Sulzberger, New York; Harold N. Cole, Cleveland; Harold Thomas Hyman, New York, and David C. Elliott, Chicago.

Dr. Jack G. Hutton, Denver, read a paper on "Rocky Mountain Spotted Fever." Discussed by Drs. Robert J. Bailey, Spokane, Wash., and Jack G. Hutton, Denver.

Drs. Morris Waisman, Chicago, and Hamilton Montgomery, Rochester, Minn., presented a paper on "Verrucae Planae and Epithelial Nevi Including a Study of Epidermodysplasia Verruciformis." Discussed by Drs. Marcus Rayner Caro, Chicago; Adolph B. Loveman, Louisville, Ky.; Francis A. Ellis, Baltimore; Fred D. Weidman, Philadelphia, and Hamilton Montgomery, Rochester, Minn.

Drs. Samuel B. Frank and Charles R. Rein, New York, presented a paper on "Dyskeratoid Dermatoses." Discussed by Drs. M. H. Goodman, Baltimore; Nelson Paul Anderson, Los Angeles; Maximilian E. Obermayer, Chicago; Francis A. Ellis, Baltimore; Hamilton Montgomery, Rochester, Minn.; Fred D. Weidman, Philadelphia, and Charles R. Rein, New York.

FRIDAY, JUNE 6—AFTERNOON

Dr. Clyde L. Cummer, Cleveland, reported that the resolution presented at the Wednesday session had been introduced in the House of Delegates, which in turn eliminated the third paragraph regarding the chief of each special department being a medical officer holding a certificate from the appropriate national board in the specialty and referred it to the Committee on Medical Preparedness.

The following officers were elected: chairman, C. Ferd Lehmann, San Antonio, Texas; vice chairman, Paul E. Rechet, New York; secretary, Nelson Paul Anderson, Los Angeles; member of the American Board of Dermatology and Syphilology, Dr. Paul O'Leary, Rochester, Minn.

Dr. J. Gardner Hopkins, New York, moved a vote of thanks to the local committees, especially Dr. Cummer and Dr. Cole, for their kindness to visiting members. The motion was seconded and carried by a rising vote.

Drs. Maurice Sullivan and Jane Nicholls, Baltimore, presented a paper on "Nutritional Dermatoses in the Rat: VI. Signs and Symptoms Resulting from a Diet Containing Unheated, Dried Egg White as the Source of Protein." Dis-

cussed by Drs. Paul Gyorgy, Cleveland; Paul Gross, New York, and Maurice Sullivan, Baltimore.

Dr. Paul Gross, New York, read a paper on "Nummular Eczema: Its Clinical Picture and Successful Therapy." Discussed by Drs. Samuel W. Becker, Chicago; Everett C. Fox, Dallas, Texas; John G. Downing, Boston; Joseph Muller, Worcester, Mass.; Henry D. Niles, New York, and Paul Gross, New York.

Dr. Herman Goodman, New York, read a paper on "Rational Prescription Writing in Dermatology." Discussed by Dr. Torald H. Sollmann, Cleveland.

Drs. David Bloom, New York; Samuel R. Kaufman and Russel A. Stevens, Wilkes-Barre, Pa., presented a paper on "Hereditary Xanthomatosis: Familial Incidence of Xanthoma Tuberosum Associated with Hypercholesterolemia, Cardiovascular Involvement and Several Cases of Sudden Death." Discussed by Drs. Theodore Cornbleet, Chicago, and David Bloom, New York.

Drs. Duncan O. Poth and Sidney R. Kaliski, San Antonio, Texas, presented a paper on "Hormone Therapy in Tinea Capitis." Discussed by Drs. George M. Lewis, New York; Noah E. Aronstam, Detroit; Theodore Cornbleet, Chicago; C. Ferd Lehmann, San Antonio, Texas, and Duncan O. Poth, San Antonio, Texas.

SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Clarence D. Selby, Detroit.

Dr. Joseph W. Mountin, Washington, D. C., read a paper on "A Plea for Unity at the State Level." Discussed by Drs. R. H. Markwith, Columbus, Ohio; Henry A. Holle, Chicago; John A. Ferrell, New York; James N. Baker, Montgomery, Ala., and Joseph W. Mountin, Washington, D. C.

Dr. Dale C. Stahle, Harrisburg, Pa., read a paper on "A Clinical Analysis of Fifteen Thousand Cases of Pneumonia: An Evaluation of the Effectiveness of Various Therapeutic Agents." Discussed by Drs. John J. Shaw, Philadelphia; Jesse G. M. Bullowa, New York; Adolph Rumreich, Bethesda, Md., and Dale C. Stahle, Harrisburg, Pa.

Drs. Lewis Gregory Cole and William Gregory Cole, White Plains, N. Y., presented a paper on "Social and Economic Justice to Labor and Industry Alike in Pneumoconiosis, Based on Correlation of Roentgenologic and Pathologic Observations." Discussed by Drs. A. J. Lanza, New York, and Lewis Gregory Cole, White Plains, N. Y.

Drs. Harold L. Israel, H. W. Hetherington and John G. Ord, Philadelphia, presented a paper on "A Study of Tuberculosis Among Nursing Students." Discussed by Drs. H. C. Stewart, Cleveland; George J. Boines, Wilmington, Del., and Harold L. Israel, Philadelphia.

Dr. Theodore L. Bliss, Akron, Ohio, read a paper on "A Practical and Successful Tuberculosis Case-Finding Program for Nonmetropolitan Areas." Discussed by Drs. Robert E. Plunkett, Albany, N. Y., and Theodore L. Bliss, Akron, Ohio.

Dr. R. T. Legge, Berkeley, Calif., read the following resolution, recently adopted by the American Industrial Physicians and Surgeons, and presented to the Council on Industrial Health:

WHEREAS, There has been a marked increase in the number of physicians and surgeons devoting their services to the practice of industrial medicine and surgery; and

WHEREAS, There are at present several universities offering courses and many universities contemplating the establishment of departments to offer courses in the practice of industrial medicine and surgery; and

WHEREAS, The American Medical Association has recognized the importance of this special type of practice by the establishment of the Council on Industrial Health with its many diversified activities in this specialty field; be it

Resolved, That the American Association of Industrial Physicians and Surgeons recommend the appointment of a committee of three members of this association to cooperate with a similar committee from the related section of the American Medical Association to further the establishment of an American Board of Industrial Medicine and Surgery and to seek the approval for this American Board of Industrial Medicine and Surgery by the Advisory Board for Medical Specialties.

Dr. Legge said that the committee appointed by the American Industrial Physicians and Surgeons was Drs. Edward C. Holmblad, Chicago; Frederick William Slobe, Chicago, and Volney S. Cheney, Chicago.

Dr. Legge moved that the resolutions be presented to the section for adoption. The motion was regularly seconded. The chairman suggested that the resolutions be referred to the executive committee to be referred back tomorrow. The motion was put to a vote and was carried.

THURSDAY, JUNE 5—MORNING

The chairman read a telegram from Dr. Huntington Williams, Baltimore, vice chairman of the section, regretting his inability to be present.

The following officers were elected: chairman, Dr. Haven Emerson, New York; vice chairman, Dr. Joseph W. Mountin, Washington, D. C.; secretary, Dr. W. A. Sawyer, Rochester, N. Y.; executive committee: Dr. Harold S. Diehl, Minneapolis; Dr. Clarence D. Selby, Detroit, and Dr. Haven Emerson, New York; delegate, Dr. Stanley H. Osborn, Hartford, Conn.; alternate, Dr. Leverett Dale Bristol, New York; chairman, Committee on Section Exhibit, Dr. Paul Arthur Davis, Akron, Ohio.

Dr. I. C. Riggan, Richmond, Va., reported for the executive committee, to which the resolutions presented by the Association of Industrial Physicians and Surgeons at the Wednesday session were referred, recommending that the section cooperate and work with the association and suggesting that the following members of the section by the chairman as a committee to work with the association: Drs. Leverett Dale Bristol, New York; R. T. Legge, Berkeley, Calif., and W. A. Sawyer, Rochester, N. Y.

On motion made by Dr. I. C. Riggan, Richmond, Va., it was voted that the section adopt a suitable resolution signifying its willingness and desire to cooperate with the Association of Industrial Physicians and Surgeons, and that the chairman of the section be authorized to appoint Drs. Bristol, Legge and Sawyer as a committee to represent the section in working with the association.

Dr. Haven Emerson, New York, presented the following memorial at the request of Dr. Chesley and of members of the American Epidemiological Society:

Charles Value Chapin 1856-1941

About the end of the last century and the beginning of the current one, public health was quite generally regarded as a just barely respectable "job," routine and somnolent; in process of being nudged into unwilling half-awakeness by the eager, enterprising interloper Bacteriology, itself then only half hatched, its "sea legs" still to be found.

The Superintendent of Health and Registrar of a small city in the smallest state of the Union, on a small salary and with small facilities (except an illimitable courage and an inimitable brain) undertook single handed to introduce thinking into somnolence, clearcut objectives into blindfold routine; the vital use, not the mere piling up of vital statistics; incidentally asking of all practicing public health departments first how they practiced (which many answered) and then why, to which latter question the answers were chiefly (and probably very discreetly) silence; indeed, in public health circles Why was then very generally considered a question almost blasphemous, surely impertinent or ignorant, or just silly.

The writer remembers, with deep feeling, private comments by public health men on two of Chapin's earlier findings—that terminal disinfection accomplished nothing except the unwarranted conveyance of a harmful illusion of safety; that typhoid fever did not come from water but always from people, though sometimes through water, and also sometimes through other things.

The commentators disagreed usually on one point only, i. e. as to whether, within the next two years, Chapin would arrive

(a) in an asylum or (b) in jail. One of these very regrettable and long-since very regretful commentators was the present writer himself [REPORTER'S NOTE.—Dr. Emerson is not the writer]. In the face then of innumerable critics all keenly watchful and nearly all confidently expectant of "inevitable" disaster, Chapin calmly abolished terminal disinfection in his own bailiwick, Providence, Rhode Island, knowing well (private letter) that if any even fortuitous, perfectly casual epidemic should occur in Providence within a year or two he would be done, professionally and personally. But the Fates were kind to public health, and terminal disinfection, not Chapin, was discarded everywhere, finally.

The foremost epidemiologist of a day when epidemiology was lucky to find some persons who could spell it, although very few even of these could define it; the leader ever since in teaching the fundamentals of the epidemiologies of today, even before they were generally recognized as epidemiological; most cautious and careful in research, most prompt, bold and incisive in action, Charles Value Chapin was—is—the greatest and most generously helpful of all creditors; to whom public health men have owed for more than a third of a century a growing debt that on Jan. 31, 1941 became forever, alas, quite unpayable. (Anon.)

It was the consensus that the foregoing memorial be spread on the minutes, and, at the suggestion of Dr. Harold B. Wood, Harrisburg, Pa., that a copy of it be sent to Mrs. Chapin and that it be printed in THE JOURNAL.

On motion made by Dr. Leverett Dale Bristol, New York, it was voted that the executive committee of the section be authorized to create a cooperating committee on industrial health to work with the Council on Industrial Health in matters of mutual interest.

Dr. Clarence D. Selby, Detroit, read the chairman's address, entitled "Industrial Hygiene Marches On."

Dr. Edgar V. Allen, Rochester, Minn., read a paper on "The Health of Business and Professional Men." Discussed by Drs. Reginald Fitz, Boston; L. G. Rowntree, Philadelphia; Joseph W. Mountin, Washington, D. C.; Millard Knowlton, Hartford, Conn.; Harold S. Diehl, Minneapolis; Leverett Dale Bristol, New York, and Edgar V. Allen, Rochester, Minn.

Dr. W. H. Lipman, Chicago, read a paper on "U. S. Government Meat Inspection After a Third of a Century." Discussed by Dr. Edward Himself, Cleveland.

Drs. W. F. Wells, M. W. Wells and T. S. Wilder, Philadelphia, presented a paper on "The Environmental Control of Epidemic Contagion: I. Schools." Discussed by Drs. James E. Perkins, Albany, N. Y., and William A. Sawyer, Rochester, N. Y.

Drs. John L. Rice, Alfred Cohn, Arthur Steer and Eleanor L. Adler, New York, presented a paper on "Recent Investigations on Gonococcal Vaginitis." Discussed by Drs. Reuel A. Benzon, New York; Goodrich C. Schaffner, Portland, Ore.; Haven Emerson, New York; Carl A. Wilzbach, Cincinnati, and Alfred Cohn, New York.

Dr. Reginald Fitz, Boston, read a paper on "Interns and Their Health." Discussed by Drs. Haven Emerson, New York; Harold S. Diehl, Minneapolis, and Reginald Fitz, Boston.

FRIDAY, JUNE 6—MORNING

A joint meeting was held with the Section on Pediatrics.

The following papers were read in a panel discussion, during which Dr. Haven Emerson, New York, presided:

Dr. Benjamin M. Spock, New York: "Uses and Abuses of School Medical Examinations."

Dr. Harry S. Gradle, Chicago: "Eye Examinations in Public Schools."

Dr. Abraham H. Kantrow, Astoria, Long Island, N. Y.: "The School Health Service and the Private Physician."

Dr. George M. Wheatley, Plandome, Long Island, N. Y.: "Communicable Disease and the School."

Dr. M. R. Kinde, Battle Creek, Mich.: "Communicable Disease Control."

SECTION ON UROLOGY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9:10 by the chairman, Dr. Meredith F. Campbell, New York.

Dr. Joseph P. Evans, Cincinnati, read a paper on "The Physiologic Basis of the Neurogenic Bladder."

Dr. Michael Kinney O'Heeron, Houston, Texas, read a paper on "Cystometry: Its Value and Limitations."

Drs. John L. Emmett and J. Byron Beare, Rochester, Minn., presented a paper on "Bladder Difficulties in the Tabetic Patient with Special Reference to Surgical Treatment by Transurethral Resection."

Drs. Reed M. Nesbit and William G. Gordon, Ann Arbor, Mich., presented a paper on "Surgical Treatment of the Autonomous Neurogenic Bladder."

Dr. Carlisle F. Schroeder, Detroit, read a paper on "Presacral (Superior Hypogastric) Neurectomy: Its Value and Limitations."

These five papers were discussed by Drs. William P. Herbst, Washington, D. C.; Lloyd G. Lewis, Baltimore; Herbert Ellis Landes, Chicago; Frederick C. McLellan, New York; Irving Simons, New York; Harold C. Voris, Chicago; Joseph D. Evans, Cincinnati; Michael Kinney O'Heeron, Houston, Texas; John L. Emmett, Rochester, Minn.; William G. Gordon, Ann Arbor, Mich., and Carlisle F. Schroeder, Detroit.

THURSDAY, JUNE 5—MORNING

Drs. John H. Powers and Marjorie F. Murray, Coopers-town, N. Y., presented a paper on "Juvenile Hypertension Associated with Congenital and Inflammatory Lesions of the Upper Urinary Tract."

Dr. George M. Fister, Ogden, Utah, read a paper on "Fibrosis and Submucous Calcification of the Vesical Neck."

These two papers were discussed by Drs. Herbert Beach Wright, Cleveland; Marjorie F. Murray, Cooperstown, N. Y., and George M. Fister, Ogden, Utah.

Dr. Meredith F. Campbell, New York, read the chairman's address, entitled "Resection of the Kidney."

Dr. Roy B. Henline read a paper on "The Surgical Treatment of Prostatic Disease." Discussed by Drs. Hermon C. Bumpus, Pasadena, Calif.; Charles C. Higgins, Cleveland; George Franklin Farman, Los Angeles; Victor D. Lespinasse, Chicago, and Roy B. Henline, New York.

Dr. Elmer Hess, Erie, Pa., read a paper on "Renal Sympathectomy: An Evaluation of Fifteen Years' Experience."

Drs. John Hartwell Harrison and Orville T. Bailey, Boston, presented a paper on "The Significance of Necrotizing Pyelonephritis in Diabetes Mellitus."

These two papers were discussed by Drs. Thomas P. Shupe, Cleveland; William P. Herbst, Washington, D. C., and Orville T. Bailey, Boston.

FRIDAY, JUNE 6—MORNING

The following officers were elected: chairman, Dr. Vincent J. O'Connor, Chicago; vice chairman, Dr. Gershom Thompson, Rochester, Minn.; secretary, Dr. Grayson L. Carroll, St. Louis; delegate, Dr. Hermon C. Bumpus, Pasadena, Calif.; alternate, Dr. Carl Rusche, Los Angeles.

Drs. Ferdinand Welebir and Roger W. Barnes, Los Angeles, presented a paper on "The Use of P-Sulfanil-Acetyl-Imide in the Treatment of E. Coli Urinary Tract Infections."

Dr. William Bromme, Detroit, read a paper on "The Chemotherapy of Gonorrheal Urethritis in the Male."

These two papers were discussed by Drs. Edward Noble Cook, Rochester, Minn.; Edwin Pascal Alyea, Durham, N. C.; W. Ray Jones, Seattle; Victor D. Lespinasse, Chicago; Walter M. Simpson, Dayton, Ohio; Roger W. Barnes, Los Angeles, and William Bromme, Detroit.

Drs. J. Sydney Ritter, New York, and Samuel E. Kramer, Perth Amboy, N. J., presented a paper on "Modern Urologic Pharmacology." Discussed by Drs. John H. Morrissey, New York; Walter M. Kearns, Milwaukee, and J. Sydney Ritter, New York.

Drs. Gray H. Twombly, Harold L. Temple and Archie L. Dean Jr., New York, presented a paper on "The Clinical Value of the Aschheim-Zondek Test in Testicular Tumors." Dis-

cussed by Drs. Joseph H. Kiefer, Chicago; J. B. Gilbert, Schenectady, N. Y.; Grayson L. Carroll, St. Louis, and Gray H. Twombly, New York.

Dr. Roy Pelham Finney, Spartanburg, S. C., read a paper on "The Principle of Traction in the Treatment of Ureteral Stone." Discussed by Drs. Victor D. Lespinasse, Chicago; George R. Livermore, Memphis, Tenn.; Hermon C. Bumpus, Pasadena, Calif., and Roy Pelham Finney, Spartanburg, S. C.

Dr. Lowrain E. McCrea, Philadelphia, read a paper on "The Value of Cystoscopic Photography in Medicine."

SECTION ON ORTHOPEDIC SURGERY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. J. Albert Key, St. Louis.

Dr. M. Beckett Howorth, New York, read a paper on "Leg Shortening." Discussed by Dr. Joseph A. Freiberg, Cincinnati.

Drs. Charley J. Smyth, Richard H. Freyberg and Isadore Lampe, Ann Arbor, Mich., presented a paper on "Roentgen Therapy for Rhizomelic Spondylitis, from the Rackham Arthritis Research Unit, and the Department of Radiology, the Medical School, University of Michigan." Discussed by Drs. Bernard I. Comroe, Philadelphia; Carl E. Badgley, Ann Arbor, Mich., and Charley J. Smyth, Ann Arbor, Mich.

Dr. Henry W. Meyerding, Rochester, Minn., read a paper on "Benign and Malignant Giant Cell Tumors: Diagnosis and Result of Treatment." Discussed by Dr. Theodore A. Willis, Cleveland.

Dr. Frederick A. Jostes, St. Louis, read a paper on "Neck Pain: Laminography as an Aid to the Diagnosis of Atlanto-Occipital Lesions." Discussed by Drs. W. Edward Chamberlain, Philadelphia; Sherwood Moore, St. Louis; Marius N. Smith-Petersen, Boston, and Frederick A. Jostes, St. Louis.

Drs. Lenox D. Baker and Chester H. Waters Jr., Durham, N. C., presented a paper on "Vitallium Cup Arthroplasty of the Hip: A Preliminary Report on the Results in Sixteen Patients with Nineteen Arthroplasties." Discussed by Drs. Marius N. Smith-Petersen, Boston; G. Mosser Taylor, Los Angeles; Hugh Smith, Memphis, Tenn.; Carl E. Badgley, Ann Arbor, Mich., and Lenox D. Baker, Durham, N. C.

Drs. William T. Green and Leo J. McDermott, Boston, presented a paper on "Operative Treatment of Cerebral Palsy of Spastic Type." Discussed by Drs. Beveridge H. Moore, Chicago; Manuel E. Pusitz, Topeka, Kan., and William T. Green, Boston.

THURSDAY, JUNE 5—MORNING

Drs. Roland Hammond, Providence, R. I., and Denis S. O'Connor, New Haven, Conn., presented a paper on "Occult Fractures." Discussed by Drs. Walter C. Hill, Cleveland; Charles N. Pease, Chicago, and Roland Hammond, Providence, R. I.

Drs. Edward L. Compere, Chicago, and George T. Wallace, Spokane, Wash., presented a paper on "The Choice of Materials for Internal Fixation of Fractures of the Neck of the Femur." Discussed by Drs. Austin T. Moore, Columbia, S. C.; Rudolph S. Reich, Cleveland, and Edward L. Compere, Chicago.

Dr. J. Albert Key, St. Louis, read the chairman's address, entitled "The Use of Sulfanilamide and Sulfathiazole in Orthopedic Surgery."

Dr. David M. Bosworth, New York, read a paper on "The Supraspinatus Syndrome: Symptomatology, Pathology and Repair." Discussed by Drs. Joseph J. Kurlander, Cleveland; Laurence Jones, Kansas City, Mo., and David M. Bosworth, New York.

The following officers were elected: chairman, James A. Dickson, Cleveland; vice chairman, Guy A. Caldwell, New Orleans; secretary, Francis M. McKeever, Los Angeles; executive committee: Robert V. Funsten, Charlottesville, Va.; J. Albert Key, St. Louis, and James A. Dickson, Cleveland; delegate, James Archer O'Reilly, St. Louis; alternate, J. E. M. Thomson, Lincoln, Neb.

Dr. James Archer O'Reilly, St. Louis, gave a report as delegate to the House of Delegates.

The chairman appointed Drs. James Archer O'Reilly, St. Louis, and Frederick A. Jostes, St. Louis, as a committee to

draft memorial resolutions on the death of Dr. Willis C. Campbell, Memphis, Tenn., to be sent to the Campbell Clinic and to the family of Dr. Campbell.

It was voted that the chairman appoint a committee to represent the section on the Committee of Industrial Health and Hygiene, and the chairman appointed Drs. E. J. Berkheiser, Chicago; W. P. Blount, Milwaukee, and Edward L. Compere, Chicago.

Drs. Walter A. Hoyt and Adrian E. Davis, Akron, Ohio, presented a paper on "The Treatment of Acute Osteomyelitis by Sulfathiazole Without Operation." Discussed by Drs. Clarence H. Heyman, Cleveland; Carl E. Badgley, Ann Arbor, Mich.; Lenox D. Baker, Durham, N. C.; Frederick A. Jostes, St. Louis, and Walter A. Hoyt, Akron, Ohio.

FRIDAY, JUNE 6—MORNING

A joint meeting was held with the Section on Surgery, General and Abdominal.

Drs. Jonathan E. Rhoads and M. T. Fliegelman, Philadelphia, presented a paper on "The Mechanism of Delayed Wound Healing in the Presence of Hypoproteinemia." Discussed by Drs. Charles G. Johnston, Detroit, and Jonathan E. Rhoads, Philadelphia.

Drs. Virgil H. Moon, D. R. Morgan, Marshall M. Lieber and Donald J. McGrew, Philadelphia, presented a paper on "Similarities and Distinctions Between Shock and the Effects of Hemorrhages." Discussed by Dr. Henry N. Harkins, Detroit.

Drs. D. Henry Poer and Ira A. Ferguson, Atlanta, Ga., and Edward Woliver, Cincinnati, presented a paper on "Traumatic Rupture of the Intestine Due to Nonpenetrating Wounds of the Abdomen." Discussed by Dr. W. L. Estes Jr., Bethlehem, Pa.

Dr. Hugh Smith, Memphis, Tenn., read a paper which he had prepared in cooperation with the late Dr. Willis C. Campbell, entitled "Fresh Compound Fractures: Treatment by Sulfadiazine and by Internal Fixation in Selected Cases." Discussed by Drs. Harold R. Bohlman, Baltimore; John E. Cannaday, Charleston, W. Va., and Hugh Smith, Memphis, Tenn.

The chairman eulogized the late Dr. Willis C. Campbell, and the audience stood for a moment in silence in respect for his memory.

Dr. Frank J. Cox, New Orleans, read a paper on "The Splinting of Compound Fractures." Discussed by Drs. H. A. Swart, Charleston, W. Va., and Frank J. Cox, New Orleans.

Dr. Rex L. Diveley, Kansas City, Mo., read a paper on "Chemotherapy in the Treatment of Compound Fractures." Discussed by Drs. Francis M. McKeever, Los Angeles; Robert W. Johnson Jr., Baltimore, and Rex L. Diveley, Kansas City, Mo.

SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Frank C. Yeomans, New York.

The following papers were read as a Symposium on Mouth Lesions:

Dr. Burrill Bernard Crohn, New York: "Halitosis."

Dr. Louis A. Rosenblum, New York: "Lesions of the Mouth Associated with Deficiency Diseases."

Dr. Benjamin F. Miller, Chicago: "Observations on Human Dental Caries."

These three papers were discussed by Drs. A. H. Aaron, Buffalo; Thomas T. Mackie, New York; Walter H. Shealy, Sharpsburg, Md.; Louis A. Rosenblum, New York, and Benjamin F. Miller, Chicago.

The following papers were read in a Panel Discussion on Drug Therapy in the Alimentary Tract, during which Dr. Sara M. Jordan, Boston, presided:

Dr. Donald H. Slaughter, Dallas, Texas: "Control of Gastrointestinal Function by Centrally Acting Drugs."

Dr. Harry Gold, New York: "Control of Gastrointestinal Function by Drugs Acting Peripherally."

Dr. James W. Morgan, San Francisco: "Harmful Effects of Mineral Oil Purgatives."

Dr. Ernest Carroll Faust, New Orleans: "The Chemotherapy of Intestinal Parasites."

THURSDAY, JUNE 5—AFTERNOON

Dr. Frank C. Yeomans, New York, read the chairman's address, entitled "Proctology: Its Field and Qualifications."

The following papers were read as a Symposium on Lesions of the Rectum and Large Intestine:

Dr. Montague S. Woolf, San Francisco: "Morbidity and Mortality After Resections of the Rectum."

Dr. Jack G. Kerr, Dallas, Texas: "Squamous Cell Carcinomas of the Anorectal Region."

Dr. Louis J. Hirschman, Detroit: "The Colostomy Question."

These three papers were discussed by Drs. Neil W. Swinton, Boston; G. Johnson Hamilton, New York; Clement L. Martin, Chicago; Descum C. McKenney, Buffalo; Thomas E. Jones, Cleveland; William H. Daniel, Los Angeles; C. Alexander Hellwig, Wichita, Kan.; Claude C. Tucker, Wichita, Kan.; Frank C. Yeomans, New York; Montague S. Woolf, San Francisco; Jack G. Kerr, Dallas, Texas, and Louis J. Hirschman, Detroit.

Drs. Charles W. Mayo and Edward Starr Judd Jr., Rochester, Minn., presented a paper on "Resection of the Right Colon for Nonspecific Ileocolitis." Discussed by Drs. Max Thorek, Chicago; Burrill Bernard Crohn, New York, and Charles W. Mayo, Rochester, Minn.

Drs. Enid Rodaniche, Joseph Barnett Kirsner and Walter L. Palmer, Chicago, presented a paper on "Studies on Lymphopathia Venereum Infections of the Rectum." Discussed by Drs. Herbert T. Hayes, Houston, Texas; Moses Paulson, Baltimore; Arthur W. Grace, New York; Zacharias Bercovitz, New York; Harold F. Sawyer, Detroit, and Walter L. Palmer, Chicago.

Dr. Michael H. Streicher, Chicago, read a paper on "Clinical Summary of the Management of Nine Hundred and Twelve Cases of Chronic Ulcerative Colitis." Discussed by Drs. Martin S. Kleckner, Allentown, Pa.; Zacharias Bercovitz, New York; Isaac R. Jankelson, Boston; J. A. Barga, Rochester, Minn.; David J. Sandweiss, Detroit, and Rachelle Seletz, Los Angeles.

FRIDAY, JUNE 6—AFTERNOON

The following officers were elected: chairman, Dr. Walter L. Palmer, Chicago; vice chairman, Dr. Emmett H. Terrell, Richmond, Va.; secretary, Dr. Sara M. Jordan, Boston; executive committee: Dr. A. H. Aaron, Buffalo; Dr. Frank C. Yeomans, New York, and Dr. Walter L. Palmer, Chicago; delegate, Dr. Louis A. Buie, Rochester, Minn.; alternate, Dr. Walter A. Fansler, Minneapolis; chairman Committee on Section Exhibit, Dr. Grant H. Laing, Chicago.

Dr. Harold O. Hofmeyr, Capetown, Union of South Africa, read a paper on "The History of Vitamin C Deficiency in the South African Native."

The following papers were read as a Symposium on Studies on the Stomach:

Drs. Henry A. Rafsky and Michael Weingarten, New York: "Clinical Appraisal of Various Methods of Treating Bleeding Peptic Ulcer, Based on a Series of Four Hundred Cases."

Dr. Albert F. R. Andresen, Brooklyn: "Intractable Peptic Ulcers: Are They a Surgical or a Medical Problem?"

Dr. George B. Eusterman, Rochester, Minn.: "Carcinomatous Gastric Ulcer: Misleading Results of Medical Therapy."

These three papers were discussed by Drs. Nathaniel E. Reich, Brooklyn; John Day Garvin, Pittsburgh; James F. Weir, Rochester, Minn.; Sara M. Jordan, Boston; Sidney A. Portis, Chicago; J. Shelton Horsley, Richmond, Va.; Everett D. Kiefer, Boston; David J. Sandweiss, Detroit; Henry A. Rafsky, New York; Albert F. R. Andresen, Brooklyn, and George B. Eusterman, Rochester, Minn.

Drs. Allan L. Cohn, Alfred S. White and Helen B. S. Weyrauch, San Francisco, presented a paper on "Kaolin Granuloma of the Stomach."

Drs. Frank E. Hamilton and George Morris Curtis, Columbus, Ohio, presented a paper on "Clinical Indications for Inducing Gastric Hypomotility."

Dr. Leonidas H. Berry, Chicago, read a paper on "Evaluation of the Concept 'Chronic Alcoholic Gastritis' with Gastroscopic Studies of One Hundred Cases."

These three papers were discussed by Drs. David J. Sandweiss, Detroit; Howard T. Karsner, Cleveland; Roby John F. Renshaw, Cleveland; Herman J. Moersch, Rochester, Minn.; Walter L. Palmer, Chicago; Allan L. Cohn, San Francisco; Frank E. Hamilton, Columbus, Ohio, and Leonidas H. Berry, Chicago.

SECTION ON RADIOLOGY

WEDNESDAY, JUNE 4—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Raymond C. Beeler, Indianapolis.

Dr. C. C. Birkelo, Detroit, read a paper on "The Roentgen Diagnosis of the Primary Tuberculous Infection."

Dr. Horton R. Casparis, Nashville, Tenn., read a paper on "So-Called Childhood Tuberculosis: What Is It?"

These two papers were discussed by Drs. Frederick Slyfield, Seattle; Ralph S. Bromer, Bryn Mawr, Pa.; C. C. Birkelo, Detroit, and Horton R. Casparis, Nashville, Tenn.

Dr. Richard H. Overholt, Brookline, Mass., read a paper on "Advantages of Permanent Collapse Therapy in Pulmonary Tuberculosis." Discussed by Drs. Edward J. O'Brien, Detroit, and Richard H. Overholt, Brookline, Mass.

Drs. Leo G. Rigler and Chauncey N. Borman, Minneapolis, and John F. Noble, St. Paul, presented a paper on "Gallstone Obstruction: Pathogenesis and Roentgen Manifestations." Discussed by Drs. James T. Case, Chicago, and Leo G. Rigler, Minneapolis.

Drs. Joseph S. Barr, James R. Lingley and Edward A. Gall, Boston, presented a paper on "A Study of the Effect of Roentgen Irradiation on the Epiphyses of the Albino Rat." Discussed by Drs. Rollin H. Stevens, Detroit; John T. Murphy, Toledo, Ohio, and Edward A. Gall, Boston.

THURSDAY, JUNE 5—AFTERNOON

Dr. Raymond C. Beeler, Indianapolis, read the chairman's address, entitled "Some Immediate Problems Facing the Radiologist."

Dr. Thomas T. Mackie, New York, read a paper on "Vitamin Deficiencies and the Small Intestine."

Dr. Ross Golden, New York, read a paper on "The Small Intestine in Vitamin B Deficiency."

Dr. Michael J. Lepore, New York, read a paper on "A Syndrome Due to Deficiency of the Vitamin B Complex."

Dr. C. Allen Good, Rochester, Minn., read a paper on "Tumefactive Lesions of the Small Intestine."

These four papers were discussed by Drs. Eugene P. Pendergrass, Philadelphia; David Adlersberg, New York; Merrill C. Sosman, Boston; Ross Golden, New York; Michael J. Lepore, New York, and C. Allen Good, Rochester, Minn.

FRIDAY, JUNE 6—AFTERNOON

The following officers were elected: chairman, Dr. Ralph S. Bromer, Bryn Mawr, Pa.; vice chairman, Dr. Lyell C. Kinney, San Diego, Calif.; secretary, Dr. John T. Murphy, Toledo, Ohio; executive committee: Dr. Merrill C. Sosman, Boston; Dr. Raymond C. Beeler, Indianapolis, and Dr. Ralph S. Bromer, Bryn Mawr, Pa.

The chairman, Dr. Raymond C. Beeler, Indianapolis, read a letter from Dr. Carl M. Peterson, secretary of the Council on Industrial Health, American Medical Association, suggesting that the Section on Radiology appoint a committee to work in close relationship with the Council on Industrial Health with regard to problems confronting anesthetists in relation to industrial practice.

On motion made by Dr. J. W. Pierson, Baltimore, and regularly seconded, it was voted that the incoming chairman be empowered to appoint a committee of three for this purpose.

Drs. Julius B. Abels, John S. Kenney and Mr. L. D. Marinelli, New York, presented a paper on "Postirradiation Changes in the Levels of Organic Phosphorus in the Blood of Patients with Leukemia." Discussed by Edith Quimby, M.A., New York, and Dr. John S. Kenney, New York.

Drs. Leonard A. Scheele and Dean B. Cowie, Bethesda, Md., presented a paper on "Radiation Protection in Forty-Five Hospitals." Discussed by Edith Quimby, M.A., New York, and Drs. John T. Murphy, Toledo, Ohio, and Leonard A. Scheele, Bethesda, Md.

Drs. Robert E. Fricke and Charles O. Heilman, Rochester, Minn., presented a paper on "Results of Radium Treatment of Cancer of the Uterine Fundus with Special Reference to the Microscopic Grade of the Lesion." Discussed by Drs. U. V. Portmann, Cleveland, and Robert E. Fricke, Rochester, Minn.

Dr. William V. Tenzel, New York, read a paper on "Radiation Therapy in Carcinoma of the Lung."

Dr. Orville N. Meland, Los Angeles, read a paper on "The Influence of Radiation on Longevity in Cancer of the Breast." Discussed by Drs. U. V. Portmann, Cleveland; John E. Wirth, Baltimore, and Orville N. Meland, Los Angeles.

SECTION ON ANESTHESIOLOGY

WEDNESDAY, JUNE 4—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Ralph M. Waters, Madison, Wis.

The secretary, Dr. John S. Lundy, Rochester, Minn., read letters of congratulation on the organization of the section from the secretaries of the Sections on Pediatrics; Laryngology, Otology and Rhinology; Urology; Gastro-Enterology and Proctology; Practice of Medicine; Pharmacology and Therapeutics; Ophthalmology; Nervous and Mental Diseases; Preventive and Industrial Medicine and Public Health; Dermatology and Syphilology, and Surgery, General and Abdominal.

The vice chairman, Dr. T. J. Collier, Atlanta, Ga., read a letter of congratulation from Mr. Thomas E. Keys, reference librarian, Mayo Clinic.

Greetings were extended by Drs. Samuel Johnston, Toronto, Ont.; Frank H. Lahey, Boston, incoming President, American Medical Association; James E. Paullin, Atlanta, Ga., chairman, Council on Scientific Assembly; Morris Fishbein, Chicago, Editor, *THE JOURNAL*, and Nathan B. Van Etten, New York, Past President, American Medical Association.

Dr. Walter C. Alvarez, Rochester, Minn., read a paper on "The Men Who Discovered Anesthesia." Discussed by Drs. John H. Evans, Buffalo; Ansel M. Caine, New Orleans; F. M. Summerville, Oil City, Pa.; W. Allen Conroy, Edmonton, Alta., and Walter C. Alvarez, Rochester, Minn.

Drs. Ralph M. Tovell and Joseph E. Remlinger, Hartford, Conn., presented a paper on "History and Present Status of Oxygen Therapy and Resuscitation." Discussed by Drs. Alvan L. Barach, New York; Frederick A. D. Alexander, Albany, N. Y.; Ralph T. Knight, Minneapolis, and Ralph M. Tovell, Hartford, Conn.

Dr. H. Boyd Stewart, Tulsa, Okla., read a paper on "The Volatile Anesthetics: Ether, Divinyl Ether, Chloroform and Ethyl Chloride." Discussed by Drs. Samuel Johnston, Toronto, and H. Boyd Stewart, Tulsa, Okla.

The secretary read a telegram from Dr. Paluel J. Flaggs, New York, who was scheduled to discuss this paper.

THURSDAY, JUNE 5—MORNING

Dr. Ralph M. Waters, Madison, Wis., read the chairman's address, entitled "The Chemical Absorption of Carbon Dioxide from Anesthetic Atmospheres."

Drs. Achilles L. Tynes, Washington, D. C.; William W. Nichol, San Francisco, and Sidney C. Wiggin, Boston, presented a paper on "Anesthesia for Military Needs." Discussed by Drs. George W. Crile, Cleveland; Douglas B. Kendrick,

Washington, D. C.; Lyman Weeks Crossman, Red Bank, N. J.; Philip D. Woodbridge, New Haven, Conn., and Achilles L. Tynes, Washington, D. C.

Dr. Urban H. Eversole, Boston, read a paper on "Anesthesia for Surgery About the Head." Discussed by Drs. Frederick W. Clement, Toledo, Ohio; B. Burdell Sankey, East Cleveland, Ohio, and Urban H. Eversole, Boston.

Dr. Paul W. Searles, Buffalo, read a paper on "Intravenous Anesthesia." Discussed by Drs. Rolland J. Whitacre, East Cleveland, Ohio; George J. Thomas, Pittsburgh; James I. Yanick, Hornell, N. Y.; Harold D. Green, Cleveland; F. M. Summerville, Oil City, Pa., and Paul W. Searles, Buffalo.

Dr. Virginia Apgar, New York, explained that illness prevented Dr. James T. Gwathmey, New York, from attending and presenting his scheduled paper on "Anesthesia and Analgesia by Ether and Various Drugs Rectally."

FRIDAY, JUNE 6—MORNING

The following officers were elected: chairman, Dr. T. J. Collier, Atlanta, Ga.; vice chairman, Dr. Fayette E. Hubbard, Montclair, N. J.; secretary, Dr. John S. Lundy, Rochester, Minn.; executive committee: Dr. Henry S. Ruth, Merion Station, Pa.; Dr. Ralph M. Waters, Madison, Wis., and Dr. T. J. Collier, Atlanta, Ga.; representative to committee on Scientific Exhibits, Dr. Paul M. Wood, New York; delegate, Dr. Henry S. Ruth, Merion Station, Pa.; alternate, Dr. Charles F. McCuskey, Glendale, Calif.

On motion made by Dr. Emery A. Rovenstine, New York, and regularly seconded, it was voted that the Section on Anesthesiology accept the function, previously exercised by the Section on Surgery, General and Abdominal, of nominating delegates to the American Board of Anesthesiology.

The secretary, Dr. I. S. Lundy, Rochester, Minn., read a letter from the secretary of the American Board of Anesthesiology, requesting that permission be granted to the American Society of Anesthetists to nominate four representatives to the American Board of Anesthesiology, in place of three, as the Pacific Coast Association of Anesthetists is no longer active.

On motion made by Dr. Philip D. Woodbridge, New Haven, Conn., and regularly seconded, it was voted that this permission be granted.

The delegate, Dr. Henry S. Ruth, Merion Station, Pa., gave a brief report on the proceedings of the House of Delegates.

Dr. Emery A. Rovenstine, New York, read a paper on "Therapeutic Nerve Block." Discussed by Drs. Charles F. McCuskey, Glendale, Calif.; Brian C. Sword, New York; Paul W. Searles, Buffalo; Urban H. Eversole, Boston, and Emery A. Rovenstine, New York.

Drs. Henry S. Ruth, Merion Station, Pa.; Ivan B. Taylor and Frederick P. T. Haugen, Philadelphia, presented a paper on "Serial Spinal Anesthesia." Discussed by Drs. William T. Lemmon, Philadelphia; Philip D. Woodbridge, New Haven, Conn., and Ivan B. Taylor, Philadelphia.

Drs. Clayton P. Wangeman and Malcolm H. Hawk, Madison, Wis., presented a paper on "Effects on Human Respiration of Morphine, Atropine and Scopolamine Alone and Combined." Discussed by Drs. Dennis E. Jackson, Cincinnati; Ivan B. Taylor, Philadelphia, and Clayton P. Wangeman, Madison, Wis.

Dr. Harvey C. Slocum, Madison, Wis., read a paper on "An Apparatus for the Automatic Recording of Diastolic and Systolic Blood Pressure in Clinical Practice." Discussed by Drs. John K. Potter, East Cleveland, Ohio; John S. Lundy, Rochester, Minn.; Ivan B. Taylor, Philadelphia, and Harvey C. Slocum, Madison, Wis.

Dr. Thomas H. Seldon, Rochester, Minn., read a paper on "Effect of Certain General Anesthetic Agents on the Small Vessels of the Rabbit's Ear." Discussed by Drs. Eliot R. Clark, Philadelphia; Edgar V. Allen, Rochester, Minn.; Dennis E. Jackson, Cincinnati, and Thomas H. Seldon, Rochester, Minn.

On motion made by Dr. Ansel M. Caine, New Orleans, and seconded by Dr. Harvey C. Slocum, Madison, Wis., it was unanimously voted that in the absence of Dr. Eliot R. Clark, Philadelphia, his discussion be read by the secretary.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status.—H. R. 3864 has passed the House, proposing to amend the act providing for the registry of pursers and surgeons as staff officers of vessels of the United States by creating a medical division in the staff department to be under the charge of the senior registered surgeon on the vessel. H. R. 4476, a bill providing for sundry matters relating to the military establishment and including a provision authorizing the employment of osteopaths as interns in the Army, came up for consideration on the calendar of the House, June 16, but action on the bill was prevented on objection by Representative Cole of New York.

Bills Introduced.—H. R. 4888, introduced by Representative Green, Florida, authorizes the Administrator of Veterans' Affairs, within the limits of Veterans' Administration facilities, to furnish necessary dental care and treatment to veterans of any war who were not dishonorably discharged and who are not otherwise entitled to such dental services under any other law or veterans regulation. H. R. 4905, introduced by Representative Voorhis, California, undertakes to facilitate standardization and uniformity of procedure relating to the determination of service connection of injuries or diseases alleged to have been incurred in or aggravated by active service in a war, campaign or expedition. H. R. 4906, introduced by Representative Rogers, Massachusetts, proposes to authorize an appropriation of \$25,000,000 to establish a Women's Army Auxiliary Corps for noncombatant service with the Army, to make available to the national defense the knowledge, skill and special training of

the women of the nation. H. R. 4286, introduced by Representative Sabath, Illinois, proposes to amend the sections of the Social Security Act providing aid for the blind so as to eliminate the requirement that a blind person must be needy before he is entitled to benefits. H. R. 4853, introduced by Representative Rankin, Mississippi, proposes to authorize the hospitalization of retired officers and enlisted men who are war veterans on parity with other war veterans.

DISTRICT OF COLUMBIA

Bills Introduced.—S. 1443, introduced by Senator Reynolds, North Carolina, proposes to authorize the Federal Security Administrator to accept gifts for St. Elizabeths Hospital and to provide for the administration of such gifts. H. R. 4837, introduced by Representative Randolph, West Virginia, provides that it shall be unlawful, except for purposes directly connected with the administration of old age assistance, aid to the blind, aid to dependent children, home care and general public assistance, and in accordance with rules and regulations prescribed by the Board of Public Welfare of the District of Columbia, for any person or persons to solicit, disclose, receive, make use of, or to authorize, knowingly permit, participate in, or acquiesce in the use of, any list of names of, or any information concerning persons applying for or receiving such assistance, directly or indirectly derived from the records, papers, files, or communications of the Board of Public Welfare of the District of Columbia, or acquired in the course of performance of official duties.

MEDICAL ECONOMIC ABSTRACTS

CASH DISABILITY INSURANCE

A Statement by the Bureau of Medical Economics

At the special session of the House of Delegates, Sept. 16 and 17, 1938, called to consider a proposed National Health Program, the recommendation on insurance against loss of wages during sickness received the following endorsement:

In essence, the recommendation deals with compensation of loss of wages during sickness. Your committee unreservedly endorses this principle, as it has distinct influence toward recovery and tends to reduce permanent disability. It is, however, in the interest of good medical care that the attending physician be relieved of the duty of certification of illness and recovery, which function should be performed by a qualified medical employee of the disbursing agency.

This form of cash compensation during disability is now attracting general interest. The New Hampshire legislature in 1939 passed "an act establishing a commission for the purpose of studying the possibilities of protecting individuals unemployed because of sickness or ill health." This commission has just reported in favor of the enactment of legislation for this purpose.¹ The commission made a study of the frequency of disabling illness among New Hampshire workers and found that there were 112 cases of such disability per thousand employees. This is a somewhat lower rate than has been found under most of the compulsory sickness insurance schemes of Europe. The average period of incapacity was found to be five calendar weeks. There was a considerably higher rate of disability in the low income classes as compared with those receiving over \$1,500 a year. It was found that not over 29 per cent of the employees are at present covered by any form of disability insurance. In 1939 the companies doing an accident and health insurance business in the state received \$583,243.43 as premiums and paid losses amounting to \$299,335.72. While it was recognized that there are some difficulties in certification of incapacity for work by a private physician, it was thought that "Administrative machinery can be devised to provide checks on malingering which admittedly is possible under the family

physician plan." The plan proposed a tax of 1 per cent on earnings, which it was believed would be more than adequate to provide benefits of one half of average earnings during the previous year for sixteen weeks of disability, after one week's waiting period, in any one year. It was proposed that the plan be administered by the workmen's compensation authorities. Since only sixteen weeks of disability would be paid for, the plan would make no provision for permanent disability. This recommendation was based on the thought that "Insurance against invalidity or permanent disability is partially provided in the Federal Old Age and Survivors' Insurance Program."

The Social Security Board is investigating social insurance for permanently disabled workers.² The board evidently disagrees with the New Hampshire commission and believes that permanent disability at least should be handled in connection with old age benefits. The discussion by the chairman, Mr. A. J. Altmeyer, recognizes the difficulty of avoiding duplications with compensation benefits. He proposes that the disability to be insured is not to be confined to industrial injuries and diseases. At the present time the person who is unemployed because of illness not only receives no benefit from unemployment insurance but, because of his inability to earn wages while disabled, may lose his privilege of receiving unemployment compensation should he return to work. It is suggested that, "after the introduction of disability insurance, periods of certified disability during which the worker is in receipt of disability benefits can be readily entered on the wage record of the worker, and his eligibility for old age and survivors benefits can be determined by omission of these periods. Thus, in effect, the insurance rights of the worker would be maintained during periods of certified disability." It is proposed that such disability insurance be accompanied by provisions for rehabilitation, and attention is called to the rehabilitation program in West Virginia which was originated by the West Virginia State Medical Association.

1. Commission on Disability Benefits, Report to His Excellency Robert O. Blood, Governor of New Hampshire, Concord, N. H., Concord Press, 1941.

2. Altmeyer, A. J.: Social Insurance for Permanently Disabled Workers, Social Security Bulletin 4:3, number 3, Washington, D. C., Social Security Board, Federal Security Agency, March 1941.

WOMAN'S AUXILIARY

California

The auxiliary to the San Francisco County Medical Society held a benefit bridge party on May 16 at the home of the county medical society, the proceeds of which will go to a scholarship fund to aid senior medical students at Stanford and California medical schools. Mrs. Eugene Kilgore, the new president of the auxiliary, assisted by a committee, was in charge of the benefit.

The Monterey group held a benefit bridge recently at the Hotel Del Monte. Three hundred members and guests attended, and the proceeds will be used to purchase equipment for the children's ward at the El Sausal Sanitarium in Salinas. The San Diego auxiliary helped plan the Symposium on Military Medical Preparedness, held in February. The meeting was sponsored by the California Medical Association in conjunction with the local society and the army, navy and marine corps.

Delaware

The Woman's Auxiliary to the Medical Society of Delaware held an open meeting, February 11, in Wilmington with one hundred guests present. Dr. John A. Kolmer, of Temple University School of Medicine, Philadelphia, talked on social diseases. Mrs. V. E. Holcombe, president of the Woman's Auxiliary to the American Medical Association, and Dr. Raymond A. Lynch, chairman, advisory board of the Medical Society of Delaware, were guests.

Idaho

The Ada County auxiliary held its January meeting at the homes of Mrs. Harmon Tremaine and Mrs. R. R. Jones in Boise. A lively discussion of pending legislation was held.

Arrangements were made to aid charitable institutions in Boise and Nampa. While their husbands were attending a meeting of the Southwest Medical Society in Boise the wives attended a "no host" dinner in the same hotel. Mrs. A. B. Boeck, president, Ada County division of the woman's auxiliary, presided. Mrs. Harmon Tremaine, president of the state auxiliary, spoke. Dr. James Hollingsworth spoke on his experiences in Czechoslovakia while he was a student. Members attended from Boise, Payette, Nampa, Meridian, Mountain Home and St. Maries.

As a special project this year the Canyon County auxiliary has placed Hygia in all schools. A series of talks has been given on articles taken from medical books of over a hundred years ago. Mrs. V. C. Belknap is president of the group and Mrs. E. D. Hunsaker is secretary.

New Jersey

The Woman's Auxiliary to the Bergen County Medical Society met at Englewood Hospital, with Mrs. Raynold Berke presiding. Mrs. G. E. Timberman, of Tidgewood, was the speaker; she spoke on flower arrangements. The auxiliary voted to contribute \$25 to the American Red Cross. The auxiliary sponsored a buffet supper and dance, recently, in Englewood; the proceeds went into the philanthropic fund.

The Essex County auxiliary met recently in the Academy of Medicine with Mrs. J. Irving Fort presiding. William D. Palmer, of the Milk Inspection Association, spoke on the grading of milk. Mrs. Rox Wright, chairman of the Shelter Workroom, described the work it is doing in rehabilitating crippled girls. Mrs. George Scheller, widows' and orphans' chairman, reported that the society is contributing about \$1,000 at Christmas time among doctors' widows.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Plague Infection.—*Public Health Reports* notes that plague infection has been proved by animal inoculation in a ground squirrel, *Citellus beecheyi*, submitted to the laboratory April 21 from a ranch 7 miles south and 5 miles west of Tehachapi, Kern County. Plague infection has been proved, by animal inoculation and cultures, in organs from two rats, *Rattus norvegicus*, taken from a garbage dump at the foot of Gertrude Avenue, Richmond, Contra Costa County, submitted to the laboratory of the state department of health on April 28, it is reported.

Residencies Available.—Residencies in the specialties are available to qualified medical graduates at the Los Angeles County General Hospital and will be filled from an eligible list to be established on the basis of an unassembled open competitive civil service examination. Application to take the examination must be filed with the Los Angeles County Civil Service Commission by July 18. Candidates must have been graduated with a degree of M.D. from an approved medical school within six years prior to Jan. 1, 1941 and have completed at least a one year internship in an approved hospital. A residency or second year of internship or postgraduate work in an approved medical school of graduate instruction is desirable. The length of service is from one to three years. Uniforms and medical care will be provided and, in addition, \$50 a month will be paid for the first year and \$115 a month for the second and third years with the exception of the specialty of anesthesiology, for which the salary is \$115 for each of the three years. Other specialties named are dermatology and syphilology, general medicine, neurologic medicine, neurosurgery, orthopedic surgery and pediatrics. Application blanks and additional information concerning the examination can be obtained from the office of the Los Angeles County Civil Service Commission, Room 102, County Hall of Records, Los Angeles.

DISTRICT OF COLUMBIA

President of Society Called to Army Service.—Dr. Daniel L. Borden, president of the Medical Society of the District of Columbia, has received orders from the War Department calling him to active service as lieutenant colonel in the medical corps. He will become chief surgeon of the new thousand bed hospital at Fort Meade, Md. Dr. Borden's term as president of the medical society will end on June 30 and he will report for service at Fort Meade the next day. In the first World War Dr. Borden served overseas as chief surgeon of Evacuation Hospital 18.

GEORGIA

Society News.—The Fulton County Medical Society was addressed, May 19, by Drs. Gordon G. Allison on "The Six Venereal Diseases" and George F. Eubanks, "Carcinoma of the Left Colon." A special report of the appendicitis committee of the state medical association was presented before the society on May 5 by Dr. Fred F. Rudder. Other speakers were Drs. Jefferson L. Richardson on "Tachycardia" and Rudolph A. Bartholomew, "Interpretation of Blood Pressure Behavior During Pregnancy and Puerperium." All are from Atlanta.

Personal.—Evangeline Papageorge, Ph.D., assistant professor of biochemistry, Emory University School of Medicine, Atlanta, has been awarded the Sterling fellowship in biochemistry at Yale University, New Haven.—Dr. Warren A. Coleman, Eastman, has been appointed lieutenant colonel on the staff of Governor Eugene Talmadge.—Dr. Edgar H. Greene, Atlanta, has been appointed state selective service medical officer.—Dr. Walker L. Curtis, College Park, has been appointed medical examiner of the Civil Aeronautics Administration, succeeding the late Dr. David D. Moncrief, Atlanta.

ILLINOIS

First Aid Following Injuries on the Highway.—The educational committee of the state medical society has prepared a series of twenty-five articles on first aid for use in the Illinois newspapers as part of an educational campaign on first aid following injuries on the highway. The plan has received the approval of the department of public works and buildings, division of highways. The first article in the series is entitled "Leave 'Em Where They Lie" and concludes with the suggestion that persons wishing additional information should write to the newspaper in which the article appeared.

Drive on Tuberculosis.—Three regional conferences in central and southern Illinois were held May 13 and 14 to launch an intensive drive against tuberculosis in the state, according to a statement from the state department of health, May 2. Dr. Jay Arthur Myers, professor of internal medicine, preventive medicine and public health, University of Minnesota Medical School, Minneapolis, discussed tuberculosis control measures in Minnesota that made it possible to close some of the sanatoriums there. The state department of health decided on the campaign after a study showing more cases and deaths from the disease in Illinois in 1940 than in 1939. It was pointed out that the number of new cases of tuberculosis in the state outside Chicago dropped from 3,257 in 1939 to 2,801 in 1940, but that the number of downstate tuberculosis deaths increased by 52, giving a total for 1940 of 1,741. In a news release Dr. Roland R. Cross, Springfield, director of health of Illinois, said that "communicable disease experts have found that for every death from tuberculosis there are usually about 10 active cases left among the living."

Chicago

School for Crippled Children to Be Expanded.—Newspapers announced April 24 that construction was to begin on a \$700,000 addition to the Spalding School for Crippled Children. The two story brick addition will double the size of the school and give space for a complete educational unit from kindergarten through high school. Rooms will be provided for hydrotherapy, electrotherapy and physical therapy, ultraviolet ray, spastic and cardiac cases, deaf-oral and sight-hearing cases, and dental work. The addition will also contain assembly hall, gymnasium, library, music room, lunchroom, roof solarium and play space.

Dr. Hoffman Named State Alienist.—Dr. Harry R. Hoffman, associate clinical professor of neurology, Rush Medical College, has been appointed state alienist to succeed the late Dr. H. Douglas Singer. Dr. Hoffman's position as director of the Cook County Behavior Clinic will be filled by Dr. William H. Haines as acting director, newspapers reported. Dr. Haines had served eighteen months as Dr. Hoffman's assistant. Dr. Hoffman graduated at Rush Medical College in 1910. Dr. Vladimir G. Urse was named on June 2 to succeed Dr. Francis J. Gerty as medical director of the Cook County Psychopathic Hospital when the latter resigned to become professor and head of the department of psychiatry at the University of Illinois College of Medicine.

Koessler Fellowship.—The Jessie Horton Koessler Fellowship of the Institute of Medicine of Chicago for the aid of research in biochemistry, physiology, bacteriology or pathology will be available on September 1. The stipend is \$500 a year with the possibility of renewal for one or two years. To be considered, applications must be approved by the head of a department in the fields mentioned or by the director of a research institute or laboratory in Chicago. Such approval must stipulate that the recipient of the fellowship shall be given adequate facilities for carrying out the proposed research, concerning which full information is required in the application. Applications, which will be received to July 1, should be made by letter and addressed to Dr. Harry Gideon Wells, 950 East Fifty-Ninth Street, chairman of the committee on the Jessie Horton Koessler Fund.

IOWA

Tuberculosis Program in Rural Schools.—The Polk County Medical Society has approved a long range tuberculosis program in the five rural schools in the county. Under the new setup all school children, at the request of parents, will be examined for tuberculosis and an active epidemiologic follow-up will be made among all positive reactors, with emphasis on the younger age groups, in which there is greater likelihood of familial origin. An earlier case finding program was limited to high school children, but the new plan was instituted in the Runnels, Urbandale, Altoona, Grimes and

MEDICAL NEWS

2877

Johnston schools. If a pupil is found to be a reactor, the family physician is furnished with a report and the child is urged to consult him. Nursing follow-up is available through the county health unit. If a roentgenogram is desired, arrangements are to be made on a private basis unless the family is unable to pay. Provisions and facilities are available for roentgen ray service on a free or part pay basis on request to the Polk County Tuberculosis Association. The program, which includes the education of teachers, students and parents relative to tuberculosis, is to be extended to the remaining rural schools in the next three years. The county tuberculosis association and Dr. Marvin F. Haygood, Des Moines, acting director of the county health unit, are cooperating in the project.

MISSISSIPPI

State Medical Election.—Dr. Hubert L. Rush, Meridian, was named president-elect of the Mississippi State Medical Association at its annual meeting in Biloxi, May 16, and Dr. Augustus Street, Vicksburg, was inducted into the presidency. New vice presidents are Drs. Braxton B. O'Mara, Biloxi, Hiram C. Sheffield, Jackson, and Theodore H. Rayburn, Pontotoc. Jackson was selected as the place for the meeting in 1942.

MISSOURI

University News.—The library at Washington University School of Medicine, St. Louis, recently received thirty-one volumes, principally on neurology and psychiatry, the gift of Dr. Samuel Treat Armstrong, Katonah, N. Y., class of 1879 of the St. Louis Medical College.

The Sixth Loeb Lecture.—Dr. George W. Corner, Baltimore, director of the department of embryology of Carnegie Institution of Washington, delivered the sixth Leo Loeb Lecture before the St. Louis Medical Society May 6. His subject was "The Ovarian Cycle." The lecture was established by Dr. Leo Loeb, professor emeritus of pathology and research professor of pathology at Washington University School of Medicine, St. Louis.

Personal.—Dr. Richard L. Sutton Jr., Kansas City, has been elected to membership in the Royal Society of Edinburgh. The society is composed of physicists, engineers, mathematicians, biologists and physicians. —James P. Baumberger, Sc.D., professor of physiology, Stanford University School of Medicine, San Francisco, has been granted leave of absence to serve from April 1 to December 31 as visiting professor in cytology at Washington University School of Medicine and research associate in the Barnard Free Skin and Cancer Hospital, St. Louis.

NEW YORK

Gastroenteritis Traced to Pastries.—Twenty-one cases of gastroenteritis in Erie and Chautauqua counties were recently traced to custard-filled pastries from a bakery in Chautauqua County. Inspection of the bakery showed it to be modern, clean and generally sanitary. Laboratory investigation revealed *Staphylococcus aureus* in a culture taken from one baker who had complained of sinus disease. This man had assisted in preparing the custard mixture for the pastries. Another baker had a boil on his cheek and a carbuncle on his neck. This man said he had not assisted in preparation of the custard but had helped in carrying it from a vat to a table.

Society News.—Dr. Frederick L. Patry, Albany, addressed the Greene County Medical Society at Catskill, May 13, on "Psychiatric and Neurologic Examination Facts and Deductions After Processing 10,000 Selectees." —Drs. Donato Anthony D'Esopo, New York, and Karl W. Gruppe, Utica, addressed the Utica Academy of Medicine, May 15, on "The Occipitoposterior Position—Its Mechanism and Treatment" and "Bronchoscopy in Diagnosis" respectively. —Dr. George T. Pack, New York, addressed the Medical Society of the County of Albany, May 28, in Albany on "Cancer of the Stomach." —Dr. Clement E. Schotland, Newark, N. J., gave an address on "Pseudohypertrophic Muscular Dystrophy" before the society, May 14. —Dr. George G. Smith, Boston, addressed the Onondaga County Medical Society, May 6, on "Genitourinary Problems of the General Practitioner." —Lieut. Col. Charles L. Maxwell, M. C., U. S. Army, Mitchel Field, L. I., addressed the Medical Society of the County of Nassau in Garden City, May 27, on "Medical Aspects of Air Raid Casualties and Air Raid Precautions." —Dr. Benjamin P. Watson, New York, addressed the Medical Society of the County of Westchester, Rye, June 14, on "Medical Controversies of Yesterday and Today—A Contrast."

New York City

Roosevelt Hospital Addition.—Dr. Willard C. Rappleye, commissioner of hospitals, laid the cornerstone, May 21, for a new addition to Roosevelt Hospital to replace a building recently demolished. The new wing will be five stories high and will cost \$1,000,000.

Residency in Pathology.—The Israel Zion Hospital announces that a residency in pathology is available there to physicians who have had a one year general internship in an approved hospital. For further information applicants may write to the Superintendent, Israel Zion Hospital, Tenth Avenue, Forty-Eighth to Forty-Ninth streets, Brooklyn.

Society News.—Drs. Walter E. Dandy, Baltimore, and Paul Klemperer addressed the Medical Society of the County of Kings, May 20, on "Diagnosis and Treatment of Lesions of the Cranial Nerves" and "The Essential Systemic Nature of Acute Lupus Erythematosus and Other Generalized Diseases of the Skin" respectively. —Drs. Samuel A. Thompson and James S. Edlin addressed the Brooklyn Thoracic Society, May 16, on "Bronchial Catheterization and Bronchography" and "Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis" respectively.

Faculty Changes at Columbia.—The following appointments and promotions at Columbia University College of Physicians and Surgeons were announced recently, according to *New York Medical Week*:

Dr. John H. Garlock, appointed clinical professor of surgery.
Dr. Frederick A. Mettler, professor of gross anatomy, University of Georgia School of Medicine, Augusta, associate professor of anatomy.
Howard J. Curtis, Ph.D., instructor in physiology, Johns Hopkins University School of Medicine, Baltimore, to be assistant professor of physiology.
Dr. Maurice Lenz, to be professor of clinical radiology.
Dr. Alexander Ashley Weech, to be professor of pediatrics.
Dr. John M. Hanford, to be associate professor of clinical surgery.
Dr. Arthur M. Master, Helen Gavin and Frederick R. Bailey, promoted to be assistant clinical professors of medicine.
Dr. Joseph H. Holmes, promoted to be assistant professor of ophthalmology.
Dr. Ludwig von Sallman, promoted to be assistant professor of ophthalmology.
Dr. Louis Hirschhorn, promoted to be assistant professor of pharmacology.

Graduate Fortnight.—The annual Graduate Fortnight of the New York Academy of Medicine will be held October 13-24 with "Cardiovascular Diseases Including Hypertension" as the subject. The program will include morning panel discussions, afternoon clinics and clinical demonstrations at hospitals, evening addresses and a scientific exhibit. Speakers at the evening sessions will be Drs. Carl J. Wiggers and Harry Goldblatt, Cleveland; Paul D. White, Timothy Leary, Edward D. Churchill, James C. White, Thomas Duckett Jones and Soma Weiss, Boston; George M. Piersol and Isaac Starr, Philadelphia; Harold M. Marvin, New Haven, Conn.; Donald W. Gordon Murray, Toronto, Ont.; Edgar V. Allen, Rochester, Minn.; Newell C. Gilbert, Chicago; Tinsley R. Harrison, Nashville, Tenn.; Edwin P. Maynard Jr., Brooklyn; Robert C. DeGraff, Gerald H. Pratt, Irving S. Wright, Harold E. B. Pardee and Alfred E. Cohn and Magnus I. Gregersen, Ph.D., New York.

PENNSYLVANIA

District Meeting.—The Ninth Councilor District of the Medical Society of the State of Pennsylvania held its annual meeting at Punxsutawney, June 26, with the following scientific program: Drs. Julius M. Rogoff, Pittsburgh, "Endocrine Aspects of Hypertension"; Ralph Lynch, Pittsburgh, "Prothrombin and Vitamin K in the Jaundiced Patient"; Edward J. McCague, Pittsburgh, "Genitourinary Disease"; John P. Griffith, Pittsburgh, "Cholecystitis," and Sergius V. Algin, Indiana, "Discussion of Vitamins." Dr. Francis F. Borzell, Philadelphia, president of the state society, discussed "Medical Preparedness."

Philadelphia

Medical Supplement.—The Philadelphia Record published a sixteen page medical supplement, May 6, with the cooperation of the Philadelphia County Medical Society public relations committee. All the reading matter was prepared by medical authorities selected by this committee, which also passed on all advertisements.

Professor to Retire.—Dr. Henry Field Smyth, assistant professor of industrial hygiene, University of Pennsylvania School of Medicine, is retiring at the end of the present academic year. Dr. Smyth took his medical degree at the uni-

2878

versity in 1897 and has been associated with the faculty in various capacities since 1912. He has held his present title since 1921 and in addition has served as director pro tem of the laboratory of hygiene since 1932.

Pittsburgh
Copeland, Baltimore
"Prog

Pittsburgh

Pittsburgh
Society News.—Dr. Murray M. Copeland, Baltimore, addressed the Pittsburgh Roentgen Society, May 10, on "Prognosis of Bone Tumors."—Dr. Samuel R. Haythorn, among others, addressed the Pittsburgh Academy of Medicine, May 13, on "Bituminosis and Anthracosilicosis in Relation to Tuberculosis."—The Pittsburgh Skin and Cancer Foundation, May 15, presented a clinical demonstration, May 15, of the use of roentgen ray burns in the treatment of the skin.

Annual Clinic.—The Pittsburgh Skin and Cancer Foundation presented its ninth annual clinical demonstration, May 15. Among the subjects demonstrated were roentgen ray burns, lymphatic gland tumors, skin diseases amenable to the sulfonamide group of drugs, acne vulgaris, the avitaminoses, and carcinoma of the breast and of the larynx, esophagus and tracheobronchial tree.

TEXAS

TEXAS

Physicians Honored.—Drs. Sidney M. Lister and J. Edward Hodges, two of the founders of Jefferson Davis Hospital, Houston, were honored at a dinner recently on their retirement from the active staff of the hospital. Dr. Lister graduated from Barnes Medical College, St. Louis, in 1898 and moved to Houston several years later. He has served on the state board of health and the state prison board. Dr. Hodges graduated from the University of Texas School of Medicine, Galveston, in 1897 and the University of Pennsylvania School of Medicine in 1898. Both men have been president of the Harris County Medical Society and both have served as chief of staff of Jefferson Davis Hospital. Dr. Theodore R. Hanon, now chief of staff, presented silver keys to the retiring staff members in token of their long service.

WASHINGTON

Crime Detection Laboratory.—The Tacoma General Hospital has established a crime detection laboratory, according to *Northwest Medicine*. Dr. Charles P. Larson, pathologist and director of laboratories at the hospital, will be in charge. The services of the laboratory will be available to all law enforcement agencies in the state.

Electric Meeting.—The spring meeting of the Washington Electric Association was held recently in Seattle at the Hotel Vancouver, as guest speaker was Mr. J. H. Thompson, president of the association.

Obstetric Meeting.—The spring meeting of the Washington State Obstetrical Association was held recently in Seattle, with Dr. Ludwig A. Emge, San Francisco, as guest speaker. Dr. Emge spoke on "Basic Principles of Estrogenic Therapy" and "Placental Accidents and Their Treatment." Dr. Richard S. Mitchell, Wenatchee, was elected president, Dr. John F. Fiorino, Everett, vice president and Dr. Henry H. Skinner, Yakima, secretary.

WISCONSIN

WISCONSIN

Personal.—Dr. Glenn V. Hough, formerly of Milwaukee, has been appointed health officer of the fourth public health district with headquarters at Sparta. He succeeds Dr. Edwin H. Jorris, who has been appointed director of local health services for the state board of health.—Dr. Arthur R. Zintek, Durand, has been appointed health officer of the first district with headquarters in Madison to succeed the late Dr. Guy W. Henika.

Meetings.—The Sixth and Eighth Councilor Districts will hold a joint meeting in Appleton, May 12, at 8 o'clock, with William S. Middleton, chairman, and George S. Chicago, secretary.

Services—Dr. J. H. Durand, has been appointed with headquarters in Madison to take W. Henika.

District Meetings.—The Sixth and Eighth Councilor District medical societies held a joint meeting in Appleton, May 27, with the following speakers: Drs. William S. Middleton, Madison, "Bronchiogenic Carcinoma"; Philip Lewin, Chicago, "The Foot and Ankle"; Stuart W. Harrington, Rochester, Minn., "Carcinoma of the Breast," and Walter C. Alvarez, Rochester, "Puzzling Types of Indigestion." Dr. Alvarez also spoke in the evening on "Food Allergy."—Drs. William S. Middleton, Madison, and James C. Sargent, Milwaukee, addressed the annual meeting of the Seventh Councilor District Medical Society in La Crosse, May 13, on "Shock" and "Common Injuries Involving the Urinary Tract" respectively.—The annual meeting of the Ninth Councilor District Medical Society was held at Stevens Point, May 15, with the following guest speakers: Drs. Edgar S. Gordon, Madison, on "Nutritional Deficiencies"; Theodore L. Squier, Milwaukee, "Allergy," and Elmer L. Seyringhaus, Madison, "Endocrine Deficiencies."—Speakers at the annual meeting of the Fourth Councilor District Medical Society in Lancaster, May 22, were Dr. Charles J. Newcomb, Milwaukee, on "Forceps Delivery"; I. R. Sisk, Madison, "Chemotherapy in Urinary Tract Infection" and Louis A. Brunsting, Rochester, Minn., "Treatment of Common Skin Disorders."

—Speakers at the annual meeting of the District Medical Society in Lancaster, May 22, 1907, were: Ira Charles J. Newcomb, Milwaukee, on "Forceps Delivery"; Ira R. Sisk, Madison, "Chemotherapy in Urinary Tract Infection," and Louis A. Brunsting, Rochester, Minn., "Treatment of Common Skin Disorders."

GENERAL

International College of Surgeons.—The fifth international assembly of the International College of Surgeons will be held in Mexico City, August 10-14, at the invitation of the Mexican government. Surgeons in the United States desiring information about presentation of papers or scientific exhibits are requested to query Dr. Desiderio Roman, chairman of the scientific committee, 250 South Seventeenth Street, Philadelphia. Those seeking travel information may communicate with Dr. Max Thorek, international executive secretary, 850 West Irving Park Boulevard, Chicago. Dr. Fred H. Albee, New York and Venice, Fla., is international president and Dr. Frederick M. Douglass, Toledo, Ohio, is president of the United States chapter of the college.

Second Congress on Obstetrics and Gynecology.—The committee on Maternal Welfare announces the Second Congress on Obstetrics and Gynecology, to be held in Washington, D. C., September 1-5, 1925.

Plan Second Congress on Obstetrics and Gynecology.—The American Committee on Maternal Welfare announces that the second American Congress on Obstetrics and Gynecology will be held in St. Louis, April 6-10, 1942. Headquarters will be at the Jefferson Hotel and the meeting and exhibits at the Public Auditorium. The general plan of the congress will be much the same as that of the first congress in Cleveland in 1939, with general and sectional meetings and round tables for members and evening sessions open to the public. Membership cards may be obtained by payment of the \$5 registration fee any time after September 1. Dr. Fred L. Adair, Chicago, is chairman of the executive committee and Dr. Everett D. Plass, Iowa City, of the program committee. Further information may be obtained from the Chicago office of the congress, 650 Rush Street.

Blindness Prevention.—The National Society for the Prevention of Blindness in its annual report for 1940 emphasized the increase in eye hazards brought about by expansion of industrial production made necessary by national defense plans. The society has appointed an industrial advisory committee representing industrial plants, state and federal departments of labor, the U. S. Chamber of Commerce and the American Association of Industrial Physicians and Surgeons. Many firms are using the new industrial talking slide film "The Eyes Have It," made available to the society without cost by the Pullman Company. The society is now planning an evaluation of vision testing procedures used with school children and preschool children in the hope of establishing a uniform procedure. During 1940 the National League for Nursing Education began a study of nursing education in sight conservation in cooperation with the society. The society has also arranged to cooperate with similar organizations in Latin America, has prepared an exhibit on glaucoma and has carried on its campaign to reduce blindness caused by venereal disease and by fireworks. The expenditures of the year amounted to \$159,808 and the income was \$142,062.

CANADA

CANADA
Health Conservation Winners.—Rural health units that won the 1940 Canadian Health Conservation Contest were, in the Eastern division, Terrebonne County Health Unit, St. Jerome, Que., and St. Jean-Iberville-Laprairie-Napierville Health Unit, St. Jean, Que., and, for the Western division, Peace River Health Unit, Manitoba. In the group of cities of St. Vital Health Unit, more than 100,000 population with full time services Windsor and Hamilton, Ont., were placed on the honor roll; in the group under 100,000 with a full time medical officer, Saint John, N. B., and London, Ont., were the winners and Catharines, Ont., was honored. The rural contest is financed by the W. K. Kellogg Foundation of Battle Creek, Mich., and the city contest by the Metropolitan Life Insurance Company of New York.

CORRECTIONS
Page of S

CORRECTIONS

Misstatement in Percentage of Syphilis.—The JOURNAL, June 14, page 2703, under Indiana news, reported that in the United States Army selective service group from Indiana 33,017 serologic tests were made and 321, or 3.8 per cent, showed positive reactions. The percentage should be recorded as 0.97.

Yeast Extract.—Correction is made of an error in the JOURNAL, June 14, page 2703, under "Yeast Extract (Vitamin B Compound)." The correct percentage should be recorded as 0.97.

Kinney's Yeast Extract.—Correction is made of an error in the description of Kinney's Yeast Extract (Vitamin B Complex) Tablets, 5 grains, appearing in THE JOURNAL, June 14, page 2683. In the published description it is stated that "Each tablet contains not more than 50 international units of thiamine hydrochloride." This should read "Each tablet contains not less than 50 U. S. P. units of thiamine hydrochloride."

Government Services

Annual Report on Health of the Army

Loss of time in the U. S. Army during the calendar year 1939 was the lowest for over twenty years, with a noneffective rate of 26.6 per thousand of army strength, according to the report of the surgeon general for the fiscal year ended June 30, 1940.

The strength of the army in 1939 was 191,551. Toward the end of the year inactive units were activated, new units were established and the Puerto Rican Department was set up.

Gonorrhea caused the greatest loss of time, with 175,055 days. Athletic exercises were second with 82,250 days lost, then acute nasopharyngitis with 72,921 days lost, motor vehicle accidents 67,028, tuberculosis 65,126, accidental falls 60,560, appendicitis 59,727, syphilis 46,384, hernia 45,000, bronchitis 39,359, trichophytosis 35,192 and chronic tonsillitis 32,918.

Army hospitals carried an average daily load of 10,124 patients, 4,753 of whom were military personnel. Absence from duty because of illness amounted to 2.68 per cent of the strength of the army, a reduction from the 1938 figure of 2.80. Military personnel treated on an outpatient or dispensary basis amounted to 2,611, or 1.36 per cent of the average daily strength.

The number of admissions to sick report was 101,362. Acute nasopharyngitis was the leading cause of admission to sick report as it has been for several years.

There were 584 deaths in the army in 1939, of which 296 were caused by diseases and 288 by injuries. For the sixth year motor vehicle accidents were the leading cause of death, with 97 fatalities. Other important causes were suicides 56, diseases of the coronary arteries 47, air transport accidents 36, homicides 18 and appendicitis 17.

Discharges for disability reduced the strength of the army by 1.11 per cent; 150 of those discharged were officers, 19 nurses and 1,962 enlisted men. Among enlisted men 48 per cent of the discharges for disability occurred within the first year of service, the report showed. With few exceptions the causes of these disabilities existed prior to enlistment, it was pointed out.

The chief causes of disability were schizophrenia, tuberculosis, psychoneurosis, ulcer of the duodenum, pes planus, epilepsy and arthritis.

The admission rate of venereal disease, 29.6, was lower than in 1938. The highest incidence occurred in Puerto Rico, where white enlisted men were stationed for the first time. Twenty-two per cent of the cases were of syphilis and 68 per cent of gonorrhea.

The incidence of influenza was twice as high as in the previous year, the greatest prevalence being in Panama. The fatality rate for pneumonia was higher in 1939, 5.3 per cent as compared with 3.9 in 1938; sulfapyridine and sulfathiazole were not used extensively in treatment until the latter part of the year.

The placing of white troops in Puerto Rico, where malaria is endemic, led to an extremely high admission rate in that department, 253.4 per thousand of strength. The general rate for the army was 5.2.

Seven cases of typhoid were reported. In none of the cases was the source of the infection determined, and no two were related. There were 81 cases of cancer with 36 deaths as compared to 76 cases with 30 deaths in 1938. Diseases of the nervous system remained about the same in incidence as for the past few years, causing 36 per cent of the discharges for disability. The highest rate occurred in the Philippines.

The admission rate for 1939 for injuries was the lowest since 1923. Fractures required 188,052 days of treatment, more than any disease or any other type of injury.

The number of surgical operations performed in 1939 was 24,554. Most frequent were tonsillectomies 3,461, reduction of fractures 2,772, appendectomies 1,918 and herniotomies 802.

Thirty-two officers and 639 enlisted men were invalided home from overseas garrisons. The largest number, 162, or 22.8 per cent, were brought home because of psychoses and psychoneuroses.

From December 1939 to the end of the fiscal year the following medical units had been organized: two medical regiments, one new; six new medical battalions; one provisional

medical battalion; one medical squadron reorganized and augmented; one medical troop mechanized; one ambulance company and one veterinary company reorganized and medical detachments for the infantry, field artillery and engineer units in six infantry divisions.

At the time of this report there were 110 regular army flight surgeons assigned to air corps stations and, in addition, 18 reserve flight surgeons and 94 reserve medical officers who are not flight surgeons were on extended active duty with air corps units. The expansion of the army probably will require 537 additional medical officers for air corps stations alone.

Organization of reserve hospital units in affiliation with civil institutions is progressing.

One hundred and eighty-three regular army officers completed courses of instruction at the Army Medical School, the Army Dental School, the Army Veterinary School and the Medical Field Service School and twenty-seven at other service schools. In addition, 12,645 officers, enlisted men and civilian employees were enrolled in medical department extension courses and 2,946 in medical R. O. T. C. units.

The Army Medical Museum reported 102,997 visitors during the year. A notable accession was a tumor registry maintained for several years by Dr. Joseph McFarland, Philadelphia, containing several thousand cases, most of them followed to completion.

An appropriation has been made for plans for a new building for the museum and the Army Medical Library, though no funds for land or buildings have been provided. During the year the library added 5,134 volumes and 92 periodicals, about half the latter being Spanish-American journals.

Improvement in Records of Federal Security Agency

A statement from Mr. John J. Corson, director of the Bureau of Old Age and Survivors Insurance in the Federal Security Agency, summarizes the present situation regarding the keeping of the records in that division:

Less than 0.6 of 1 per cent of all wages of employees covered by the old age and survivors insurance program reported by employers had not been posted to the individual employee's insurance account as of April 25, 1941. This small fraction of the total of over \$100,000,000,000 in wages reported by employers for their employees during the first four years' operations of this insurance system is made up principally of the earnings of casual and part time workers whose association with an employer was so brief that proper records were not established as a basis for the employer's subsequent tax reporting. A constant improvement in the accuracy and completeness of employers' reports has made possible the steady improvement of these recent records; whereas approximately 10 per cent of the employers' reports for employees were inaccurately or incompletely reported in 1937, less than 1.5 per cent were reported in this manner in 1940. Employee wage items which remained unposted to the proper individual's insurance account are reviewed daily as each claim is filed, with the consequent result that additional items are identified and credited at the time a worker or his survivor applies for his benefits.

Dr. Bruce Mayne Is Dead

Bruce Mayne, Dr.P.H., identified with the U. S. Public Health Service in various capacities since 1908, died in the U. S. Marine Hospital, Baltimore, April 30, following an extended illness. Dr. Mayne was born in London, England, in 1882. He took his M.S. degree at the University of California in 1910. Later he received a certificate from the London School of Tropical Medicine and in 1925 the degree of doctor of public health from the University of Georgia. Specializing in medical entomology, Dr. Mayne had been field assistant in entomology at the University of California 1906-1907; technical assistant of the plague laboratory of the U. S. Public Health Service, 1908-1910; entomologist, Veterinary Corps, Bureau of Science, Philippine Islands, 1910-1914; biologist and later associate sanitarian and associate entomologist, U. S. Public Health Service, 1914-1926; malariologist, Malaria Survey of India for the Imperial Government of India, 1926-1929, and since 1930 special expert in malaria research, U. S. Public Health Service. He had lectured throughout the world from time to time under special auspices.

The Bombing of Hospitals

It has been well said that London's great hospitals are in the front line of the war. Blitz or no blitz, their staffs carry on. Each hospital, in addition to its normal work, has become a casualty clearing station. At 2:30 one morning a 2,000 pound bomb struck a block of St. Thomas's Hospital and crumpled three floors. Two nurses and four masseuses were crushed to death in the masonry. Electric light cables were severed, and the gas began to fail. More bombs rained down, and damage to the extent of over \$5,000,000 was done. Nurses with cuts and other injuries carried patients down to the basement, into which water flooded. Work is now carried on there by means of dim lights with chalk signs directing the way to wards, operating rooms, and dispensary and linen stores.

The rescue work performed by the staff after the hospital had been bombed has been recognized by the conferring by the king of three George medals—on Dr. H. R. B. Norman, resident assistant physician, Mr. P. Maling, medical student, and Mr. H. E. Frewer, assistant clerk of works. Two men were trapped and injured in a confusion of blazing mains, collapsing masonry and choking fumes when a bomb destroyed the dispensary stores and crashed into the basement. Mr. Frewer led the rescue party into this dangerous area. Dr. Norman, assisted by Mr. Maling, burrowed into the débris and gave injections of morphine to the injured men, whom they ultimately extricated. At present the hospital functions under the abandoned upper floors and débris. The former linen room has become one operating room, and a laundry has been converted into another. A blanket store has become the dispensary.

A 500 pound bomb fell on the St. George's Hospital, but the nurses carried on as if nothing had happened. St. Bartholomew's, founded in 1123, has lived through two great fires and now covers 8 acres. It has had its share of bombs and moved downstairs, where it carries on. Guy's Hospital is isolated in a sea of rubble. One ward has a 15 foot bomb crater in the mosaic pavement. This was screened off, and the ward carries on. "What do your patients do in a raid?" a sister was asked. "They stay put," she said. "The women do a little knitting and the men study the football pools!"

The London Chest Hospital was damaged so much that representatives of the Ministry of Health said that they had not seen anything greater in one night's raids. Nevertheless nine days afterward the Union Jack was hoisted to announce the reopening of the hospital for outpatients and special departments, including the blood donor section. The chapel and pathologic department were totally destroyed. The north wing was so damaged that it will have to be demolished and the upper portion of the south wing was gutted by fire. The main building is without windows and, with fallen ceilings and cracked beams, is usable only under conditions of great discomfort. But though there were 82 patients and 76 staff in the hospital at the time of the damage no lives were lost and no one was seriously injured. The pathologic laboratories and museum were reduced to a heap of rubble, burying many thousand dollars' worth of apparatus and irreplaceable records. Five nurses were trapped in the wrecked part, but on release they immediately assisted in the care and evacuation of patients.

Turning from London to the provinces, in the last air attack on Coventry a hospital was bombed and a physician, three sisters, two nurses and several patients were killed. When one of the bombs fell a nurse was sheltering beneath a bed with a patient. Both fell through the floor and had a lucky escape. The nurse immediately went to help other patients, though her

hands were bleeding and her clothes were torn to shreds. Other nurses were injured, but the matron said that within a few minutes all were carrying on their duties.

Renal Failure in Injuries of the Limbs

Attacks from the air on our civilian population have brought to light a new pathologic condition—renal failure after crushing of the limbs by fallen débris. Three papers on the subject have been contributed to the *British Medical Journal* (March 22, pp. 427, 432, 434). E. G. L. Bywaters and D. Beall, of Toronto, report from the British Postgraduate Medical School 4 cases, all fatal, of crush injury of the limbs, which, because of their similarity, seem to present a new syndrome. The patient has been buried for several hours with pressure on a limb. On admission to the hospital he looks well except for swelling of the limb, some local anesthesia and whealing. The hemoglobin, however, is raised, and a few hours later, despite vasoconstriction, shown by pallor, coldness and sweating, the blood pressure falls. This is restored by transfusions of serum, plasma or occasionally blood. Anxiety may now arise concerning the circulation of the injured limb, which may show diminution of arterial pulsation with signs of incipient gangrene. Signs of renal damage soon appear and progress, even though the crushed limb is amputated. The urine, initially scanty, perhaps from the shock, further diminishes and contains albumin and many dark brown or black granular casts. The patient is alternately drowsy and anxious. Slight generalized edema, thirst and incessant vomiting develop. The blood urea and potassium become progressively higher, and death occurs within a week.

A girl of 17 was buried for nine hours with heavy masonry lying across the left leg. On admission the leg was swollen and sensation was impaired at the ankle, where all movement was lost. Her skin was pallid and clammy. The blood pressure was 85 systolic and 70 diastolic. Transfusion of plasma, followed by dextrose-saline solution, was followed by a rise in blood pressure, and urine was passed containing no albumin. But next day the leg was cold below the knee, and amputation was performed. The urine contained albumin and hyaline and granular casts and what seemed to be red cell casts. During the next five days the urine became scanty, and intravenous and other infusions were given, but she suddenly collapsed and died. The necropsy showed the kidneys large, dark red and firm, with tense capsules due to swelling of the cortex. Microscopically the convoluted tubules and loops of Henle were found severely damaged. In the amputated leg the popliteal artery was surrounded by hemorrhage, which extended along the intermuscular fascial planes. Sections of the muscle, which macroscopically looked normal, showed some fibers undergoing necrosis.

In all 4 cases severe degenerative changes were found in the convoluted tubules and muscle necrosis of varying degree. So far 11 of 16 recorded cases were of this rapidly fatal type. In the other less severe cases recovery took place. In the present uncertainty as to the pathogenesis it is not possible to recommend any special treatment. Amputation does not appear to help the renal condition.

The Food Situation

The public has been warned that food supplies will be difficult for the next three months. This does not mean that people cannot be fully nourished but that they will be restricted with regard to certain foods, mainly animal. One way in which the government is meeting the difficulty is by education in the use of food. Advice centers have been established all over the country where food demonstrations and talks on nutrition are given. These have been attended by domestic science teachers, canteen managers and workers. An attempt has been made to wean the public from a tea and bun diet to the more extensive use of vegetable sandwiches and soups. Another move is the

establishment of communal feeding centers where nutritious food can be obtained at moderate prices. These have proved an unqualified success in bombed areas. Such methods mean greater economy in the use of food and thus are equivalent to an increase of supply.

Centenary of the Pharmaceutical Society

The Pharmaceutical Society, which has celebrated the centenary of its foundation, has received the congratulations of medical societies, learned bodies and pharmaceutical societies in all parts of the empire and the United States. Sir John Anderson, who, as Lord President of the Council, represented the government, addressed the society. He reminded its members how, at the beginning of the previous great war, he was responsible for ensuring a continuous supply of all necessary drugs, which led to fruitful and useful collaboration among chemists, pharmacists and the government, with the result that, in spite of having relied on Germany before the war for so much of our supplies of drugs, we were able to get through without any noticeable shortage. The Therapeutical Substances Act sprang from the work done in that period, for, when we had succeeded in producing certain vital therapeutic substances, previously produced only in Germany, certain safeguards had to be taken in unloading them on a trusting public. The society sprang from an attempt of the medical profession to secure greater privileges at the expense of pharmacists, who might have easily slipped back to a body of privileged shopkeepers concerned solely with material interests. But its founders laid down that the main aim of the society should be to advance chemistry and pharmacy. It had maintained laboratories under highly competent chemists and stood in the van of progress.

Not the least remarkable work of the Pharmaceutical Society is the speed with which it established an educational system and thus raised the standard of the compounding and dispensing of prescriptions. The Poisons and Pharmacy Act, 1908, which controlled the sale of poisons, fundamentally changed the constitution of the society, for membership was made compulsory on all registered pharmacists. It also gave the society disciplinary control over pharmacists.

BELGIUM

May 2, 1941.

Undernourishment a Pressing Problem

The food shortage, as reported to the Society of Physicians and Surgeons of Brabant by Dr. Ketelbant, is one of the pressing problems the effects of which are seen in children's digestive disorders accompanied by diarrhea. Gastroenteritis has been common of late in nurslings and colitis in children of medium age. Atypical vitamin deficiencies have appeared. Cutaneous suppuration, impetigo, furunculosis and many cases of pyodermitis could be traced to vitamin A deficiency in a nutrition which lacked fats of good quality. In addition, the absorption of fats is much more difficult during the course of diarrheal syndromes. Infections due to *Escherichia coli* and paratyphoid seem to break down the vitamin C content of the body. Atypical vitamin deficiencies have seemed to occur most frequently of late in colibacillary infections. Food deprived of essential amino acids cannot fail to affect growth and the organic balance. The milk needs likewise have not been provided for. Milk needs to be supplied until the end of the growing period. The child of 5 years requires 1,200 calories daily; that of 5 to 7, 1,440; 7 to 9, 1,680; 9 to 11, 1,900; 11 to 12, 2,160. The present rationing, however, allows for only 1,200 to 1,300 calories daily. Further nutritional complications have arisen from protein deficiencies. At 3 years the child requires 3 Gm. per kilogram of body weight and from 5 to 15 years old 25 Gm. This is more than the child obtains at present.

The nutritional needs of pregnant women were studied by de Guchteneere and presented in *Le Scalpel*. Professor Mal-dague, he pointed out, had set the daily calory needs at 1,440 calories for the month of November 1940, amounting to 39 Gm. of proteins with 18.75 Gm. of fats and 275 Gm. of carbohydrates. The commission on diabetes of the College of Physicians of Brussels (Drs. J. Slosse, R. Verhoogen and R. Willocx) fixed them at 1,380 calories for the month of December 1940, namely 33 Gm. of proteins, 24 Gm. of fats and 252 Gm. of carbohydrates. Professor Hoet for the month of November 1940, taking account on the one hand, of the amount of food rationed to the populace (though often in quantities lower than the official figures, especially as far as potatoes and dry legumes were concerned) and, on the other hand, of the supplementary foodstuffs, moderate quantities of which could be still obtained apart from rationing restrictions, such as eggs, cheese, fish, legumes, fruit and skimmed milk, estimated a total of 1,138 calories (31 Gm. of proteins, 25 Gm. of fats, 202 Gm. of carbohydrates).

Since September 1940 pregnant women have received daily, from the fourth month on, an added ration of 750 cc. of milk and 112.5 Gm. of bread, which is equivalent to 697 calories. This meets in part the demands set up by the commission on nutrition of the College of Physicians formed in July 1940. In its report made to the ministry of public health in the same month, the commission had asked for 25 Gm. of butter (or fats rich in vitamins). The meat ration at that time amounted to 75 Gm. gross. This had been deemed insufficient. It then fell to 35 Gm., the present allowance. Altogether, pregnant women receive a daily ration fluctuating between 1,835 and 2,137 calories. Accordingly, deficiency of 800 daily calories exists in the nutrition of pregnant women, measured by an average 2,600 calories needs for pregnant women. However, for the last three months of pregnancy, the most important in fetal life, the deficiency rises to 1,200 calories daily. If these conditions persist it augurs ill for the future vitality of the Belgian race.

The first cases of deficiency edema were reported by Leon Dumont in *Le Scalpel*. They occurred in December 1940. The characteristics were a more or less developed anasarca condition, with a significant increase in the quantity of total water and a pronounced diminution of proteins in the serum. They healed spontaneously with rapidity as the result of rest and an ordinary well balanced diet.

Efforts to Unite the Belgian Medical Press

Moral disorder is the keynote at present of all attempts to create organization out of chaos, and the medical world has felt the repercussions. The efforts which have been made to unite the scattered forces of the medical press met with much cooperation and good will. Until a year ago an excessive number of medical journals was published. A few months ago the proposal was made to issue a single review combining the dispersed remnants. A Belgian review almost a century old volunteered to try this unification, with the assurance that the attempt would be abandoned if the undertaking was contrary to medical interests. The offer was not accepted. At present two medical periodicals have resumed publication, the *Archives Médicales Belges* and *Le Scalpel*. These are purely technical and scientific reviews. Besides these, the following journals of professional interest are appearing: *Le Médecin Belge*, organ of the Belgian medical federation, and *Mededeelingen*, organ of the Algemeen Vlaamsch Geneesheeren Verbond. These publications are bitterly opposed to each other. The first wishes to conserve the unity of the Belgian medical profession by maintaining friendly relations between the Walloon and the Flemish

physicians. The other demands the complete separation of Walloon and Flemish medical societies. The situation presents no outlook for reconciliation.

The organization of the Belgian medical profession likewise is undergoing profound changes. There is much talk at present of the fusion of the different political and professional mutual medical aid societies now existing into a single organization for the whole country. Into this single organization all those entitled to medical care belonging to the different official state departments as well as the war invalids of the wars of 1914-1918 and of 1940 could be merged. However, a cleavage already appears in that isolated groups, such as medical care claimants belonging to the country police and the railroads, are organizing separately, whereas the soldiers and their families have been integrated into the single organization. Military health service has been dissolved and the personnel either has been returned to civil life or is employed in certain medical or paramedical activities. Unfortunately, nothing constructive has been reared to take the place of what has been destroyed. In view of this situation, many government organizations (families of soldiers, employees, arsenal workers and their families) entitled to medical care can no longer lay claim to it. If this situation persists, it will cause havoc.

New Medical Journal

Medicina is a new medical journal published in Buenos Aires by a group of young physicians. The members of the editorial committee have carried on work on clinical medicine, physiology, biochemistry and pharmacology in Argentina and in foreign countries. The journal is promising for the information it contains on clinical and pathologic problems. Two issues have been published, each of which contains seven original articles, one article with clinical reports, four editorials and a general review of the literature.

Dr. Braun Mendez to Lecture at University of California

Drs. Houssay, Fasciolo and Taquini made investigations by which they proved in 1937 and 1938 that the ischemic kidney produces a vasoconstrictor substance which passes to the blood. The substance is easily identifiable in the venous blood of ischemic kidneys and does not exist in the venous blood of normal kidneys. Drs. Eduardo Braun Mendez, Fasciolo, Leloir and Muñoz carried on further work for confirmation of the previous results. In 1939 they identified a hypertensive substance from the venous blood of the ischemic kidney. They found that the kidney secretes a ferment, renine. Hypertensine is the product of fermentation of the pseudoglobulin fraction of the blood plasma by renine. Page described also the substance some time after it was described by Braun Mendez. He called it angiotonine. Dr. Braun Mendez and his collaborators have carried on careful researches on the pharmacologic effects of hypertensine. The University of California appointed Dr. Braun Mendez to deliver the Morris Herzstein lecture. Dr. Braun Mendez will leave Argentina for New York in January 1942. He will deliver the lecture in San Francisco early in March 1942.

Society News

The eighth congress of the Pan American Medical Association will meet in Buenos Aires in August of this year. The subjects listed for discussion are prevention of tuberculosis, virus and virus diseases and chemotherapy. Twenty-four sections will be in session. Prof. José Arce is president of the committee on organization and Dr. José Valls is secretary.

Further information can be obtained from the secretary general, Calle Paraguay 2240, Buenos Aires.

During the celebration of the twenty-fifth anniversary of the Argentine Liga Israelita contra la Tuberculosis a new pavilion was dedicated in the province of Córdoba. It has a capacity for one hundred beds and full equipment.

Personals

Dr. José M. Leiro of the institute of the history of medicine in Buenos Aires has left for the United States to study at the University of North Carolina and at Johns Hopkins.

Dr. Jorge A. Taiana, chief surgeon of the surgical clinic of the University of Buenos Aires has left for Harvard University, under a Rockefeller grant, to study thoracic surgery.

FINLAND

(From Our Regular Correspondent)

March 28, 1941.

Previous to the Finnish-Russian War of 1939-1940 the nutritional situation in Finland had been on a fairly satisfactory level. The most troublesome problem was shortage of vitamin D, resulting in a great amount of rachitis in children of families with low incomes. The greatest enemy of health in adults, tuberculosis, was rapidly coming under control. The improved financial standing of the working class since Finland became independent and a well organized educational antituberculosis campaign were the chief factors that led to the great reduction in the mortality figures as well as a general improvement of health conditions.

The consequences of the short but disastrous war with the Soviet soon became evident. The results of twenty years of hard work for the improvement of the health of the people were undone as a result of the war of one hundred days.

In order to care for the wounded soldiers, tuberculosis sanatoriums had to be emptied and the patients sent to their homes or to other families. When, as a consequence of the peace half a million people lost their homes, they had to be taken into houses which in many instances already were crowded. All this led within a short time to a great increase in the tuberculosis morbidity. The shortage of food and difficulties in securing vitamins and other medicines contributed to the increase of morbidity in other respects. The mental depression following the war naturally also was a factor which lowered the vitality of our people and increased the tendency to sickness.

In these times of great need we have received valuable help from many countries. In this connection we especially thank the many American doctors and manufacturers of medicine who, through the Finnish legation in Washington, have sent us valuable supplies of vitamins and other useful drugs. These supplies have rapidly been forwarded to the people most in need of them, i. e. families of the evacuated and those who live on the new eastern border. A large reconstruction work is being done, and we hope that we soon shall have passed the worst times.

Marriages

MAURICE KAUFMANN, Cumberland, Ky., to Miss Sara E. Combs of Manchester, Ky., in Louisville, March 14.

JOHN W. BOLEN JR., Beckley, W. Va., to Miss Marie L. Hart of Denver at Atlanta, Ga., March 17.

ARTHUR J. BUTT, Fort Jackson, S. C., to Miss Florence Barbara McCravy of Columbia, April 27.

ARTHUR CALVIN BROUGHTON JR. to Miss Mary Frances Hunter, both of Raleigh, N. C., in April.

CHARLES RUSSELL ROBINS JR. to Miss Susan Clay, both of Richmond, Va., April 19.

SAMUEL EISENBERG to Miss Ada Rosenhouse, both of New York, April 27.

Deaths

Julius Friedenwald * Baltimore; College of Physicians and Surgeons, Baltimore, 1890; chairman of the Section on Gastro-Enterology and Proctology of the American Medical Association, 1929-1930; professor emeritus of gastroenterology at the University of Maryland School of Medicine and College of Physicians and Surgeons; past president of the American Gastroenterological Association and the Baltimore Medical Society; member of the Association of American Physicians; fellow of the American College of Physicians; visiting gastroenterologist to the Mercy Hospital; consultant in digestive diseases, Union Memorial Hospital, Church Home and Infirmary, Sinai Hospital and the Hospital for Women; trustee of the Institute for Advanced Study, Princeton, N. J.; co-author of "Guide to Clinical Laboratory Diagnosis," "Diet in Health and Disease," "Dietetics for Nurses" and "Secondary Gastrointestinal Disorders"; aged 74; died, June 8, of carcinoma of the bladder.

Ralph Berger Seem * Boston; Johns Hopkins University School of Medicine, Baltimore, 1906; member of the Medical and Chirurgical Faculty of Maryland; medical superintendent of the James Walker Memorial Hospital, Wilmington, N. C., from 1908 to 1912; at various times assistant superintendent and acting superintendent of the Johns Hopkins Hospital, Baltimore, medical director of the Billings Memorial Hospital of the University of Chicago, superintendent of the Peking (China) Union Medical College Hospital; at one time professor of hospital administration, Stanford University School of Medicine, San Francisco, and superintendent of the hospitals; formerly assistant director of the Massachusetts General Hospital; aged 60; died, May 14.

Robert Merriam Rogers * Brooklyn; Long Island College Hospital, Brooklyn, 1907; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; clinical professor of ophthalmology at his alma mater; attending ophthalmic surgeon, Long Island College Hospital; attending ophthalmologist, St. John's Hospital and House of St. Giles the Cripple; director, department of ophthalmology, Coney Island Hospital; consulting ophthalmologist, city bureau of charities, and division for the blind, New York State Department of Social Welfare; aged 57; died, May 13, of coronary occlusion.

William Neil McDonell * Medical Director, Captain, United States Navy, San Francisco; University of Minnesota College of Medicine and Surgery, 1903; member of the House of Delegates of the American Medical Association from 1922 to 1932; veteran of the Spanish-American and World wars; entered the Medical Corps of the United States Navy Sept. 19, 1904 and retired Aug. 1, 1940; received the Victory Medal, Grant Fleet Clasp, the Nicaraguan Campaign Medal and the Navy Expeditionary Medal; fellow of the American College of Surgeons; aged 64; died, May 11, in the United States Naval Hospital, Mare Island.

Earl Sprague Bullock, Detroit; Detroit College of Medicine, 1893; member of the Michigan State Medical Society; assistant professor of clinical medicine at his alma mater, now known as the Wayne University College of Medicine; veteran of the Spanish-American and World wars; at one time physician in chief of the New Mexico Cottage Sanatorium, Silver City, N. M.; on the staffs of the Leland Sanatorium, Ypsilanti, and the Shurly Hospital; aged 69; died, May 1.

Robert Garfield Savage, River Forest, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; member of the Illinois State Medical Society; fellow of the American College of Surgeons; formerly assistant clinical professor of obstetrics at the Loyola University School of Medicine, Chicago; for many years on the staff of the Oak Park (Ill.) Hospital; aged 59; died, May 7.

Frank Joseph Frosch * Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1907; Jefferson Medical College of Philadelphia, 1908; associate professor of gynecology at the Hahnemann Medical College and Hospital; fellow of the American College of Surgeons; gynecologist, Hahnemann Hospital, Philadelphia, and the Allentown (Pa.) State Hospital; aged 59; died, May 14.

James Franklin Irving, Yorkton, Sask., Canada; Manitoba Medical College, Winnipeg, 1900; past president of the Council of the College of Physicians and Surgeons of Saskatchewan; fellow of the American College of Surgeons;

attending surgeon, Queen Victoria Hospital; aged 63; died, April 20, in the Regina General Hospital, Regina, of injuries received in an automobile accident.

Frederick Benoni Sweet * Springfield, Mass.; Yale University School of Medicine, New Haven, Conn., 1893; past president of the New England Surgical Society; fellow of the American College of Surgeons; consulting surgeon, Springfield Hospital and Shriners' Hospital for Crippled Children, Springfield, Mary Lane Hospital, Ware, and Wing Memorial Hospital, Palmer; aged 70; died, May 10.

James Ives Edgerton * New York; Jefferson Medical College of Philadelphia, 1894; at one time adjunct professor of gynecology, New York Polyclinic Medical School and Hospital, New York; fellow of the American College of Surgeons; formerly surgeon, New York Polyclinic Medical School and Hospital, and St. Elizabeth's Hospital; aged 70; died, May 8, in the New York Hospital.

Ralph Parker Folsom * Poughkeepsie, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1908; instructor of psychiatry at his alma mater from 1919 to 1921; member of the American Psychiatric Association and the Association for Research in Nervous and Mental Diseases; superintendent of the Hudson River State Hospital; aged 65; died, May 12.

Frederick Paul Murphy, Lowell, Mass.; Tufts College Medical School, Boston, 1905; member of the Massachusetts Medical Society and the New England Obstetrical and Gynecological Society; for many years public school physician; aged 60; on the staff of St. John's Hospital, where he died, April 26, of coronary thrombosis and arteriosclerosis.

Raymond A. Wallace, Chattanooga, Tenn.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1902; member of the Tennessee State Medical Association and the Southeastern Surgical Congress; fellow of the American College of Surgeons; on the staff of the Baroness Erlanger Hospital; aged 65; died, April 30.

Alvin H. Rockwell * Kalamazoo, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1883; past president and secretary of the Kalamazoo Academy of Medicine; for many years health officer and director of health and welfare of Kalamazoo; aged 90; died, May 3, of cerebral hemorrhage.

Arthur Wesley Knox * Sanford, Fla.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1916; member of the Florida Medical Association; past president of the Seminole County Medical Society; served with the Canadian Army during the World War; aged 57; died, May 1, of cerebral hemorrhage.

Henry Charles Wales, Toronto, Ont., Canada; University of Toronto Faculty of Medicine, 1899; L.R.C.P., London and M.R.C.S., England, 1902; served during the World War; past president of the Academy of Medicine, Toronto; on the consulting staff of the Toronto Western Hospital; aged 65; died, April 26.

Francis Gorman Gleason * A. Surg. Lieut. (j. g.) U. S. Navy, retired, Denver; Loyola University School of Medicine, Chicago, 1930; entered the navy June 26, 1929 and retired April 1, 1934 for incapacity resulting from an incident of service; aged 39; died, May 12, in the Fitzsimons General Hospital.

William Paul Petrie * Caro, Mich.; Vanderbilt University School of Medicine, Nashville, Tenn., 1925; president of the Tuscula County Medical Society; member of the school board; chief examining physician for the county draft board; aged 41; was found dead, May 14, of an incised wound, self inflicted.

Abram Richard Stern, Danbury, Conn.; Columbia University College of Physicians and Surgeons, New York, 1899; member of the Medical Society of the State of New York; aged 66; died, May 8, in the Harkness Pavilion of the Columbia-Presbyterian Medical Center, New York.

Paul Benjamin Bender * Philadelphia; Jefferson Medical College of Philadelphia, 1915; member of the American Academy of Pediatrics; served during the World War; on the staff of the Kensington Hospital for Women; aged 54; died, May 13, in the United States Naval Hospital.

Daniel Davis * Washington, D. C.; Johns Hopkins University School of Medicine, Baltimore, 1913; professor of clinical obstetrics at the Georgetown University School of Medicine; served during the World War; aged 54; died, April 17, in the Georgetown University Hospital.

Benjamin Clifford John, Morgantown, W. Va.; University of Maryland School of Medicine and College of Physicians, Baltimore, 1920; member of the West Virginia State Medical Association; aged 44; died, April 25, in the Barnes Hospital, St. Louis, of pulmonary abscess.

Dikran Maruke Yazujian @ Trenton, N. J.; University of Pennsylvania School of Medicine, Philadelphia, 1909; fellow of the American College of Surgeons; aged 61; on the staff of the Mercer Hospital, where he died, April 27, of carcinoma of the sigmoid flexure.

George Walter Smail, Veedersburg, Ind.; Central College of Physicians and Surgeons, Indianapolis, 1898; served during the World War; aged 67; died, April 27, in the Veterans Administration Facility, Marion, of hypertension, arteriosclerosis and myocarditis.

Fred Attwood Dennis, Crawfordsville, Ind.; Medical College of Indiana, Indianapolis, 1898; member of the Indiana State Medical Association; county health officer; on the staff of the Culver Hospital; aged 65; died, May 4, of cerebral hemorrhage.

Theodore Bacmeister @ Chicago; University of Michigan Homeopathic Medical School, Ann Arbor, 1900; on the staffs of the Illinois Masonic Hospital, Ravenswood Hospital and the Belmont Hospital; aged 65; died, May 17, of coronary thrombosis.

Allen Baker Painter @ Mill Hall, Pa.; Medico-Chirurgical College of Philadelphia, 1899; past president of the Clinton County Medical Society; aged 67; on the staff of the Lock Haven (Pa.) Hospital, where he died, April 24, of lymphangitis.

John Edward Canfield @ Herkimer, N. Y.; Albany Medical College, 1903; past president of the Herkimer Academy of Medicine; served during the World War; on the staff of the Herkimer Memorial Hospital; aged 64; died, May 10.

John Robert Pence @ Minot, N. D.; Northwestern University Medical School, Chicago, 1909; county health officer; past president and secretary of the Northwest District Medical Society; aged 56; died, April 29, of pneumococcal meningitis.

Roy Alfred Page, Magdalena, N. M.; New York Homeopathic Medical College and Hospital, New York, 1894; formerly Livingston (N. Y.) County coroner; aged 69; died April 27, of bronchopneumonia and chronic myocarditis.

Perry Robert Hungerford @ Concord, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1902; past president of the Jackson County Medical Society; aged 66; died, May 3, in the Mercy Hospital, Jackson.

Harris Allen Gant, Columbia, Tenn.; University of Pennsylvania Department of Medicine, Philadelphia, 1876; for many years a member and at one time president of the state board of health; aged 89; died, May 5, of cerebral hemorrhage.

Stella Quinby Root @ Stamford, Conn.; New York Medical College and Hospital for Women, 1896; aged 69; died, April 17, in the Stamford Hospital of coronary thrombosis, chronic hypertension, nephritis and diabetes mellitus.

Oscar H. Rogers, Wellesley Hills, Mass.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1883; aged 83; died, May 17, in the Massachusetts General Hospital, Boston, of pneumonia.

Homer Odessa Leonard, Kansas City, Mo.; Chicago Medical College, 1875; member of the Missouri State Medical Association; fellow of the American College of Surgeons; aged 88; died, April 24, of carcinoma of the prostate.

A. J. Kershaw, Miami, Fla.; Meharry Medical College of Walden University, Nashville, Tenn., 1907; aged 58; died, April 20, in the Pine Ridge Hospital, West Palm Beach, of injuries received in an automobile accident.

William Elmer Anderson, Washington, Iowa; Chicago Homeopathic Medical College, 1894; member of the Iowa State Medical Society; aged 77; died, May 7, in St. Joseph's Hospital, New Hampton, of embolism.

George Stephen Bliss, South Pasadena, Calif.; Dartmouth Medical School, Hanover, N. H., 1904; at one time superintendent of the Indiana School for Feeble-minded Youths, Fort Wayne; aged 68; died in May.

George Bassett Butt, Chicago; Northwestern University Medical School, Chicago, 1900; member of the Illinois State Medical Society; aged 65; died, May 7, in St. Luke's Hospital of chronic nephritis.

Marlowe Clifford Wolfe, Madera, Pa.; University of Louisville (Ky.) School of Medicine, 1926; aged 38; died in April in the Meadville City Hospital, Meadville, of an overdose of a sleeping potion.

Zenas Freeman Lamb, Keene, N. H.; Bellevue Hospital Medical College, New York, 1887; member of the New Hampshire Medical Society; aged 76; died, April 28, of heart disease and arteriosclerosis.

Huston B. Terry, Acworth, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1900; member of the Medical Association of Georgia; aged 69; died, March 18, of coronary occlusion.

Raymond Earl Swope, Rockville, Ind.; Medical College of Indiana, Indianapolis, 1900; served during the World War; aged 65; died, April 24, in the Union Hospital, Terre Haute, of heart disease.

James Buchanan Barth, Charleroi, Pa.; University of Vermont College of Medicine, Burlington, 1884; Jefferson Medical College of Philadelphia, 1890; aged 84; died, May 7, of arteriosclerosis.

Charles Buford McCown @ Aberdeen, Miss.; Memphis (Tenn.) Hospital Medical College, 1903; on the staff of the Aberdeen Hospital; aged 62; died, April 27, of carcinoma of the lung.

John Albert Lambert, Indianapolis; Central College of Physicians and Surgeons, Indianapolis, 1891; aged 82; died, April 28, in the Methodist Hospital of arteriosclerosis and uremia.

William Thomas Franklin @ Anacoco, La.; Memphis (Tenn.) Hospital Medical College, 1899; aged 74; died, April 21, in the Highland Sanitarium, Shreveport, of heart disease.

Fletcher W. Powers, Barrett, Minn.; Minneapolis College of Physicians and Surgeons, 1902; owner and medical director of the Barrett Hospital; aged 68; died, April 26, of pneumonia.

Eleanor Way-Allen Mellen, Newton, Mass.; Woman's Medical College of Pennsylvania, Philadelphia, 1903; member of the Massachusetts Medical Society; aged 72; died, April 19.

Robert Schulman @ Morristown, N. J.; Columbia University College of Physicians and Surgeons, New York, 1906; medical director of the Aurora Institute; aged 60; died, May 15.

Charles Edson Stickney, Constable, N. Y.; Bellevue Hospital Medical College, New York, 1888; member of the Medical Society of the State of New York; aged 77; died, April 21.

Frederick Clinton Robertson, Jersey City, N. J.; University of the City of New York Medical Department, New York, 1894; aged 69; died, April 5, of coronary occlusion.

Lawrence Harry Sander, Cincinnati; Medical College of Ohio, Cincinnati, 1901; aged 57; died, May 1, in the Good Samaritan Hospital of coronary occlusion and hypertension.

Cleveland Davis, Itta Bena, Miss.; Atlanta (Ga.) College of Physicians and Surgeons, 1906; served during the World War; aged 56; died, May 4, of coronary thrombosis.

George C. Goodman, Louisville, Ky.; University of Louisville Medical Department, 1890; aged 75; died in May in the Norton Memorial Infirmary of chronic myocarditis.

Jay S. Mead, Lorain, Ohio; University of Michigan Homeopathic Medical School, Ann Arbor, 1883; aged 87; died, April 25, in St. Joseph's Hospital of chronic myocarditis.

Luther E. Wiggins, Joaquin, Texas; Memphis (Tenn.) Hospital Medical College, 1907; aged 63; was found dead, April 12, of a self-inflicted bullet wound.

Harry Scott Braman, Homer, N. Y.; College of Physicians and Surgeons, Baltimore, 1892; aged 68; died, April 23, in Niagara Falls of cerebral thrombosis.

Charles Ogden Dorchester @ Chicago; Bennett College of Eclectic Medicine and Surgery, Chicago, 1894; aged 80; died, April 27, of coronary occlusion.

George Whitney Hine, Berlin Heights, Ohio; Western Reserve University Medical Department, Cleveland, 1888; aged 83; died, April 26, of heart disease.

Rachel Edna Moulton, Minneapolis; Minneapolis College of Physicians and Surgeons, Minneapolis, 1902; aged 76; died, April 23, of coronary sclerosis.

Charles Harold Eye, Chicago; University of Illinois College of Medicine, Chicago, 1925; aged 41; died, May 1, of chronic myocarditis.

J. Ashley Thompson, Sacramento, Calif.; Medical College of Alabama, Mobile, 1880; aged 90; died, April 14, of chronic myocarditis.

Joseph Meyer, Paris, Texas; University of Louisiana Medical Department, New Orleans, 1874; aged 92; died, April 27, of senility.

John Benedict Mason, Chicago; Rush Medical College, Chicago, 1894; aged 71; died, May 11, of coronary thrombosis.

Correspondence

RAPID CLINICAL TEST FOR DIPHTHERIA
FOUND UNRELIABLE

To the Editor:—In THE JOURNAL, Aug. 19, 1939, page 675, appeared a short article by Wayne W. Fox and others on their experience with a rapid clinical test for diphtheria. In this article it was stated that this simple and rapid test, when negative, might offer sufficient reason for withholding therapeutic antitoxin until the cultures could be reported. Recently Dr. Howard Bierman and Dr. Richard Maxwell gathered data at the St. Louis Isolation Hospital which indicated that negative results from this test could not be relied on. Their experience was more extensive than that of Fox and his associates. Since it is well known that the effectiveness of diphtheria antitoxin depends largely on the promptness with which it is given, it seems to me most unfortunate that the experience of Fox and his associates should remain unchallenged if there is any doubt at all about the reliability of the test.

DAVID BARR, M.D., St. Louis.

TRANSFUSION OF PLASMA

To the Editor:—I read with interest the report in a recent issue of THE JOURNAL (May 3, p. 2015) by Dr. Frank Mayner concerning a death following a transfusion of blood plasma. My purpose in this communication is to offer a possible explanation for the lethal reaction.

In describing the collection of blood for the preparation of plasma, the author states that 50 cc. of 2.5 per cent sodium citrate was used for 450 cc. of blood, giving an effective concentration of sodium citrate of 0.25 per cent. This is the minimum concentration originally found effective for citrate transfusions by Dr. Lewisohn, whose idea in setting the concentration so low was to avoid the toxic effect of the citrate ion.

It has since been found (1) that, while 0.25 per cent is sufficient for fresh blood transfusions, this concentration does not entirely prevent coagulation but merely retards it; (2) that sodium citrate is not particularly toxic even in relatively large doses when administered by the drip method, since the body tissues quickly oxidize the citrate ion. Therefore, most operators now use 50 cc. of 3.8 per cent citrate solution for transfusions of 500 cc. of fresh blood. For stored blood and for the preparation of plasma even higher concentrations are advisable, so that in the recent project sponsored by the Blood Transfusion Betterment Association for the Preparation of Plasma for Britain 50 cc. of 5 per cent sodium citrate was used for every 500 cc. of blood.

My guess is that in the case reported in THE JOURNAL there was a slow conversion of the fibrinogen in the donor's blood into fibrin, with a release of thrombin (fibrin ferment). Thrombin is also present in fresh blood serum and is believed to be responsible for the toxicity of such serum. On the other hand, in stored serum the thrombin deteriorates so that such serum evidently is safe for use, according to the work of Levinson and his co-workers (Levinson, S. O.; Neuwelt, Frank, and Necheles, Heinrich: Human Serum as a Blood Substitute, THE JOURNAL, Feb. 10, 1940, p. 455). The patient in question apparently received not a plasma transfusion but a fresh serum transfusion. If this interpretation is correct, the interposition of a filter to remove the minute fibrin clots would not have prevented the reaction, since thrombin would pass through such a filter.

To explain the reaction, Dr. Mayner cites the reports by Plummer and Gutteridge of fatal reactions following repeated transfusions from the same donors after intervals of a month or longer. While it is true that in Dr. Mayner's case the

plasma used for the transfusion was prepared from the same donor (the patient's father) used for a previous transfusion, still in this case plasma, not whole blood, was transfused. As Wiener and Peters have shown (Wiener, A. S., and Peters, H. R.: Hemolytic Reactions Following Transfusions of Blood of the Homologous Group, with Three Cases in Which the Same Agglutininogen was Responsible, Ann. Int. Med. 13:2306 [June] 1940), repeated transfusions even with blood of the correct group can give rise to fatal hemolytic reactions, but the antigens involved are in the red blood cells, not in the plasma, so that this explanation could not apply in the case reported by Dr. Mayner.

A. S. WIENER, M.D., Brooklyn.

Medical Examinations and Licensure

COMING EXAMINATIONS

BOARDS OF MEDICAL EXAMINERS
BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of boards of medical examiners and boards of examiners in the basic sciences were published in THE JOURNAL, June 21, page 2811.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Parts I and II. Various centers, Sept. 10-12. Part III. Various centers, June or July. Exec. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: Written. Part I. Various centers, Nov. 1. Final date for filing application is Aug. 4. Sec., Dr. Paul M. Wood, 745 Fifth Ave., New York City.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: Written. Nov. 3. Final date for filing application is Sept. 23. Oral, Dec. 12-13. Final date for filing application is Nov. 8. Sec., Dr. C. Guy Lane, 416 Marlboro St., Boston.

AMERICAN BOARD OF INTERNAL MEDICINE: Written. Oct. 20. Final date for filing application is Sept. 1. Sec., Dr. William S. Middleton, 1301 University Ave., Madison, Wis.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: Written. Part I. Group B. Jan 3. Oral. Part II. Groups A and B. Atlantic City, May or June. Final date for filing application is 90 days in advance of the examination. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: Oral. Portland, July 15; Chicago, Oct. 18. Written. March 7, 1942. Sec., Dr. John Green, 6830 Waterman Ave., St. Louis.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Washington, January. Final date for filing application is Nov. 1. Sec., Dr. Guy A. Caldwell, 1640 State St., New Orleans, La.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 16-18. Final date for filing application is July 1. Sec., Dr. W. P. Wherry, 1500 Medical Arts Bldg., Omaha.

AMERICAN BOARD OF PEDIATRICS: Oral. Boston, Oct. 7-8, immediately following the annual meeting of the American Academy of Pediatrics. Written. Locally, Aug. 22. Sec., Dr. C. A. Aldrich, 707 Fullerton Ave., Chicago.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY: Oral. New York, Dec. 19-20. Final date for filing application is Oct. 5. Sec., Dr. Walter Freeman, 1028 Connecticut Ave., N.W., Washington, D. C.

AMERICAN BOARD OF RADIOLOGY: Oral. All groups. Cincinnati, Sept. 19-21. Final date for filing application is Aug. 1. Sec., Dr. Byrl R. Kirkliri, 102-110 Second Ave., S. W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: Written. Part I. Various centers, Oct. 6. Sec., Dr. J. Stewart Rodman, 225 S. Fifteenth St., Philadelphia.

AMERICAN BOARD OF UROLOGY: Chicago, February. Final date for filing application is three months before date of examination. Sec., Dr. Gilbert J. Thomas, 1009 Nicollet Ave., Minneapolis.

Rhode Island January Report

The Rhode Island Board of Examiners in Medicine reports the written examination for medical licensure held at Providence, Jan. 2-3, 1941. The examination covered 8 subjects and included 50 questions. An average of 80 per cent was required to pass. Five candidates were examined, all of whom passed. Three physicians were licensed to practice medicine by endorsement of credentials of the National Board of Medical Examiners. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Georgetown University School of Medicine..	(1938) 84,	(1939)	88
Tufts College Medical School.....	(1936)		87
St. Louis University School of Medicine.....	(1939)		86
University of Vermont College of Medicine.....	(1939)		85
School	LICENSED BY ENDORSEMENT	Year Grad.	
Harvard Medical School.....	(1938)		
Tufts College Medical School.....	(1938)		
New York Medical College and Flower Hospital.....	(1937)

MEDICOLEGAL ABSTRACTS

Insurance, Accident: Staphylococcic Infection Induced by Blowing Nose Not Due to Accidental Means.—The defendant insurance company issued a policy providing certain benefits if Smith's death resulted "directly and independently of all other causes from bodily injuries effected solely through external, violent and accidental means." Smith had a severe head cold toward the end of February 1939 and for about a week frequently blew and wiped his nose with his handkerchief. He complained of soreness in his nose March 6 and two days later his wife observed "a little raw, very red, wet spot" just on the inside of the outer wall of the right nostril that "looked sort of like a little nick in the skin." The nose was not swollen then but a swelling was noticeable the following day, and Dr. Stinson was called. According to Dr. Stinson, Smith then had a temperature of 101.6 F. and complained of general bodily aches and pains, especially in the chest. Dr. Colbert was called into consultation and observed on his first visit a definite swelling in the nose, which was characterized as a boil that was well localized. The only treatment then instituted was to strap the patient's chest. Four days later the boil had extended and inflammation and infection had spread to the face and eye. The patient was then taken to a hospital, where a lumbar puncture was made and fluid drawn from the spine which indicated the presence of staphylococci. Death ensued as the result of meningitis produced by the staphylococci. Claiming that death was due to accidental means, Smith's widow sued the insurance company to recover the benefits referred to. From a judgment in favor of the insurer, the widow appealed to the court of appeals of Tennessee.

The evidence adduced at the trial, said the court of appeals, indicated that the staphylococcus is a microscopic organism which is always present in the skin and is harbored in the mouth, about the teeth and in the nasal passages. Boils or furuncles are always formed on external surfaces of the body where there is hair, usually in the hair follicles or that part of the skin from which the hair emerges. There must, however, be some lesion or abrasion, or break in the skin to afford a port of entry for the staphylococci. The medical testimony was undisputed that the constant blowing and wiping of the nose caused it to become so raw and irritated as to afford a port of entry for the staphylococci, that this caused the boil to form and that the infection spread until the germs got into the blood stream, causing the meningitis which resulted in Smith's death. But, continued the court, these facts are not sufficient to establish that Smith's death was effected by accidental means, on which the liability of the insurer is predicated by the policy here in question. The court then adverted to the rule of law, adopted by the courts of Tennessee and by "the majority of the courts," which provides, in effect, that means are not accidental, within the meaning of policies of this sort, if death or injury is the result of the voluntary or intentional act of the insured, even though the result is unforeseen or unexpected, in the absence of some mishap or mischance or slip in the doing of the act itself.

In arriving at a decision in this case, the court of appeals relied on *Ramsey v. Fidelity & Casualty Co.*, 143 Tenn. 42, 223 S. W. 841, which cited with approval *Maryland Casualty Co. v. Spitz*, 3 Cir., 246 F. 817, 159 C. C. A. 119. In the Spitz case the insured in rubbing a boil on his neck with hands soiled with blood and other substances broke a scab, permitting germs of erysipelas to enter the circulatory system. The court in the Spitz case held that the death from erysipelas did not result from accidental means, as the breaking of the scab was a probable result of, and one reasonably to be expected from, the insured's intentional act. The facts in the Spitz case, continued the court of appeals, are not materially different from those in this case. The constant blowing and wiping of his nose by the insured was his voluntary act, and it was the ordinary and

natural result of such an operation that his nose should become raw and irritated and afford a means of admitting the germs in question into the circulatory system. There is no evidence of any slip or mishap in blowing or wiping his nose which caused it to become raw and afford a portal of entry to the staphylococci. It cannot, therefore, be said that the infection was the result of accidental means.

Smith's widow contended that it would be a reasonable deduction from the evidence to find (1) that a grain of sand or a flake of tobacco in Smith's pocket might have become attached to his handkerchief and caused the nick or splint in the tender skin of his nose; or (2) that his handkerchief had been stiffly laundered and that the edge of it cut the tender skin of the nostril, or (3) that Smith's hand slipped, causing his finger nail to inflict the injury; and that either of these findings would warrant the conclusion that the nick was caused by accidental means. The difficulty with this contention, answered the court, is that it stems from a deduction, which in turn proceeds from a pure conjecture, as there is no evidence in the record on which it could be based.

The court could find no evidence in the record which would warrant a conclusion that the infection was the result of accidental means, and accordingly the judgment of the trial court in favor of the insurer was affirmed. Subsequently certiorari was denied by the Supreme Court of Tennessee.—*Smith v. Aetna Life Ins. Co.*, 147 S. W. (2d) 1058 (Tenn., 1941).

Malpractice—Necessity for Expert Testimony.—The defendant physician operated on the plaintiff for a right direct inguinal hernia. Contending that, because of the operation his right spermatic cord had become strangulated, resulting in the atrophy of his right testicle and in a loss of sexual desire, the plaintiff sued the defendant physician. From a judgment for the defendant on a demurrer to the plaintiff's evidence, the plaintiff appealed to the Supreme Court of Kansas.

The only expert testimony produced by the plaintiff was that given by the defendant whom the plaintiff called as his own witness. The defendant described in detail the operative procedure he used and denied that he had injured in any way the spermatic cord or that the atrophy of the testicle resulted from the operation. It was the defendant's opinion, moreover, that even if the cord had been severed or strangulated during the operation the testicle would not have become atrophied for a considerable time and that such atrophy should have no effect on the plaintiff's ability to work or on his sexual desire. The defendant stated that he was familiar with the standard of care and skill used by physicians in his community, that he had performed between seven and eight hundred herniotomies and that he followed the usually accepted procedure used by physicians in that locality.

The Supreme Court pointed out that what constitutes proper treatment in any particular case is a medical question to be testified to by physicians as expert witnesses, since neither lay witnesses nor juries are sufficiently conversant with the science and practice of medicine to enable them to determine such a question without some expert explanation. The only explanation offered by the plaintiff in the present case was the defendant's testimony. That testimony, said the Supreme Court, not only failed to establish negligence but actually refuted it. The only thing the plaintiff proved was that, if the defendant had been negligent in performing the operation, the injury claimed could have, or might have, resulted therefrom. That, in the opinion of the court, was not proof of negligence. The judgment in favor of the defendant was accordingly affirmed.—*Pierce v. Edgerton*, 98 P. (2d) 129 (Kan., 1940).

Society Proceedings

COMING MEETINGS

American Physiotherapy Association, Asilomar, Calif., July 13-18. Miss Evelyn Anderson, Stanford University, Calif., Secretary.
National Medical Association, Chicago, Aug. 18-22. Dr. John T. Givens, 1108 Church St., Norfolk, Va., General Secretary.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1931 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Pentothal Sodium Anesthesia in Ophthalmology. L. W. Statt, Pittsburgh.—p. 487.
Lysozyme and Antibacterial Properties of Tears. R. Thompson, New York.—p. 491.

The Eye and Sleep.—Lebensohn points out that the credit of discovering the now recognized sleep regulation center belongs to Ludwig Mauthner. The excitability of the hypothalamus and consequent wakefulness are maintained by peripheral stimulation. A great reduction of impulses is followed progressively by lowering of sympathetic tone, depression of cortical activity and sleep. The ocular apparatus in drowsiness evidences impaired sympathetic function by drooping lids, dry eyes and congested conjunctiva. A similar syndrome in certain

cases of intractable conjunctival asthenopia, sometimes called chronic catarrhal conjunctivitis, suggests that the underlying cause is likewise an impairment of sympathetic function. In such cases the basal metabolic rate is generally somewhat below normal. The condition is relieved by small daily doses of desiccated thyroid. The results of such therapy, according to the author, have been most encouraging in several hundred cases observed in the last few years.

Vitamin C for Arsenical Sensitivity.—Vail reviews the literature and presents a preliminary report on the study of the influence of vitamin C on arsenical sensitivity. Approximately 50 per cent of patients, mostly women, treated with arsenicals complain of objectionable reactions. The type of antisiphilitic treatment does not seem to influence the blood vitamin C level. Arsenical sensitivity is usually associated with hypovitaminosis C. The few reactions that occur in the presence of normal blood vitamin C values warrant investigation to rule out psychic and other factors. Oral administration of the vitamin is effective but slow and is subject to individual variations. The best results will be obtained by intravenous methods. Severe cases may respond only to oral and intravenous therapy. Spectacular relief of sensitivity symptoms may be obtained by relatively small and heretofore believed ineffective doses of vitamin C given in conjunction with the arsenical medication. Inclusion of vitamin C in arsenical therapy does not lessen the specific response. Vitamin C is a valuable adjunct to present anti-siphilitic therapy.

Reduction of Mortality from Pulmonary Abscess.—To determine whether or not some patients recover from abscess of the lung without hospitalization, Overholt and Rumel investigated 100 patients with lung abscesses of all stages, proved by clinical history and roentgen study and made possible by the cooperation of diagnostic clinics, sanatoriums and private physicians. Even among this highly representative group of patients the results were not much different from those of other reports; 31 patients died of the disease, persistent symptoms were present in 20 and 49 were asymptomatic. The authors present their conception of the proper management of lung abscess, based on the results in 95 cases treated during the last eight years. Of the patients treated by various generally accepted therapeutic measures, excluding external drainage and excision, the mortality was 53 per cent and the cure rate 26 per cent; of those treated by lung resection the mortality rate was 23 per cent and the cure rate 62 per cent, and of those treated by external drainage at an advanced stage of the disease the mortality rate was 32 per cent and the cure rate 26 per cent. Among the patients treated by external drainage at an early stage of the disease the mortality rate was 6 per cent and the cure rate 94 per cent. It is proposed that lung abscesses be separated into simple (a single or a multilocular cavity without secondary

bronchiectasis) and complicated (multiple isolated daughter abscesses located in the surrounding zone of pneumonitis, which do not connect with the primary cavity and do not point on the surface of the lobe) stages. The outstanding factor in a simple abscess developing into a complicated one is time. The duration of most simple abscesses is less than six weeks. Therefore, delay of external drainage parallels directly the bad results obtained. Treatment based on internal drainage of the cavity fails because of the small bronchi that lead from it, which provide neither adequate drainage nor adequate aeration. These two factors must be satisfied before healing will occur. Pulmonary abscess should be considered a surgical disease from its onset, and early drainage should be instituted without delay. The provision for external drainage during the simple stage of the disease is the only type of treatment that has yielded a uniform high cure rate and a low mortality rate. A close analogy can be drawn between the history of treating pulmonary abscess to date and the early history of treating appendicitis. At present pulmonary abscess is generally considered to be a medical disease. The mortality and morbidity rates are high. Early external drainage is looked on with apprehension. The foundation of this fear has several components: the unfavorable results obtained by this procedure without exact preoperative localization of the abscess and surgical aid given only after irreparable damage has occurred. Because of this the general tendency is to cling even more tenaciously to the temporizing medical measures. The authors' opinion is that the only way to obtain low mortality and high cure rates is to employ early external drainage after accurate localization.

Experimental Human Scurvy.—Not only does the production of human scurvy by Crandon, Lund and Dill (in Crandon himself) illustrate the possibilities for isolating the part played by a single vitamin, but the fact that the subject was a healthy human being and not a laboratory animal gives the observations much significance. Fox compares their results with those gained from a study of native mine laborers and finds that the two are complementary. He observed approximately 1,000 healthy men who were on a low but not entirely deficient daily intake of ascorbic acid for seven months. The American investigators made an intensive study of 1 healthy man on a diet devoid of vitamin C for six months. A comparison and combination of the results of the two studies show the following points: 1. Total deficiency failed to produce symptoms of impaired health over a period of three months, during which time the subject was draining his stores of the vitamin. In the author's study a low daily intake gave equally negative results for seven months in individuals having very low initial reserves. 2. In neither case could any increase in capillary fragility be detected, even when frank scurvy developed. 3. With the total or the partial deprivation there was no clinical indication of ill health. 4. There was no indication that vitamin C deficiency leads to anemia. 5. In both investigations the gums remained healthy. 6. Resistance to infection had apparently not been diminished by the reduction or lack of vitamin C intake. 7. Wound healing was not impaired. 8. No less than six months of total deprivation brought about such impairment. 9. Evidently deprivation of ascorbic acid, unless extremely severe and prolonged, does not of itself lead to scurvy when precipitating factors (growth, multiple avitaminosis and infection) are absent. 10. A feeling of languor and incapacity for strenuous work was apparent only after three months of total deprivation; and even part of this may have been accounted for by the associated loss of weight. Similar indications were not observed by the author in his subjects who lived for seven months on low daily intakes. Scurvy did not develop either more quickly or more often among those doing strenuous work. 11. Neither study establishes with any certainty the daily requirements of ascorbic acid neces-

sary to maintain good health. The author's experience indicates that remarkably good health was maintained on 15 mg. or a little more of ascorbic acid. This level is in agreement with that estimated by Kellie and Zilva. The two investigations lend no support to the common assumption that large amounts of the vitamin would improve the general standard of health, though the precarious nature of meager supplies is clearly demonstrated.

*Sulfathiazole in Treatment of Staphylococcal Infections. G. Melton.—p. 274.

Elimination of Streptococci from Wounds.—Colebrook and Francis investigated the effect of local applications of sulfanilamide (and sulfathiazole) on 62 superficial wounds. The 35 patients in this study with these 62 wounds were observed for several weeks. All of them were infected with hemolytic streptococci. Of the patients 32 received sulfanilamide locally only and 3 also by mouth. The local application of sulfanilamide to 21 patients with 33 wounds infected with *Streptococcus pyogenes* resulted in permanent disappearance. The streptococci also disappeared from 10 wounds of 3 patients given sulfanilamide also by mouth. In the 6 recurrences of infection a further course of treatment resulted in the disappearance of the infection. One group C infection was freed of streptococci and healed uneventfully. Group G streptococci of 1 wound disappeared with local treatment only, in another with local and simultaneous oral therapy and in a third, unsuitable for local therapy (compound fracture of the mandible), with oral sulfanilamide only. Four instances of group D infections were found resistant to local treatment with sulfanilamide. Sulfanilamide failed to rid 2 wounds of *Strep. pyogenes*. In the few instances in which sulfathiazole was used it was not as effective as sulfanilamide. Hemolytic streptococci usually disappeared from the wounds within three or four days. Neither sulfanilamide nor sulfathiazole had consistent effects on the staphylococci, *Bacillus proteus* or *Pseudomonas pyocyanea* also present in many of the wounds.

Sulfathiazole for Staphylococcal Infections.—Melton discusses results of sulfathiazole treatment in 50 cases of staphylococcal infection, including 11 cases reported previously. Most of the infections were of a severe type (acute osteomyelitis with septicemia, acute osteomyelitis with sterile blood culture, chronic osteomyelitis, carbuncles and staphylococcal pyemia, abscess and pyopneumothorax). In staphylococcal septicemia the drug was of value when given early and in adequate doses. Rapid improvement was attributed to the drug in 5 of the 13 cases in which recovery occurred. In acute osteomyelitis it did not lessen the need for surgical drainage or check the progress of suppuration, but it reduced toxemia. Many of the carbuncles ceased to extend when the drug was begun and the pyrexial period was shortened, but 2 of 5 patients with carbuncle on the upper lip or nose died; both had cavernous sinus thrombosis before treatment was begun. The drug was also found of value after surgical drainage had been instituted in clearing up the toxemia and accelerating the subsidence of the local lesion. Early diagnosis is clearly essential to successful therapy with sulfathiazole, as failure and death occurred only in advanced cases. The action of the sulfonamides on suppurative inflammatory foci is inhibited by the presence of peptones in the pus. Thus abscesses, whether local or metastatic, will prevent successful therapy unless they are accessible to surgical drainage.

Hydronephrosis from Vascular Abnormalities. R. J. Taltavull and J. C. Tettamanti.—p. 60.

Neurologic Symptoms of Cerebral Metastases in Cancer of Lung.—Romano and Eyherabide emphasize the importance of clinical observations on patients with neurologic symptoms and of roentgen examination of the thorax in the diagnosis of cerebral metastases from bronchopulmonary cancer. In the 10 cases reported by the authors the neurologic symptoms overshadowed the bronchopulmonary symptoms. A diagnosis of bronchopulmonary cancer was made by the clinical and roentgen examinations in all cases but 2 in which bronchopulmonary cancer was found at necropsy. A necropsy was performed in 4 cases. Cerebral metastases may occur in any cerebral zone.

Did the World War Demonstrate the Necessity of Vascular Suture? H. Wenzl.—p. 948.

Vitamin E Therapy.—Herbrand and Jaeger review the present status of vitamin E, paying particular attention to its therapeutic use. They recommend the administration of vitamin E for the duration of pregnancy and lactation. In cases of habitual abortion, medication with vitamin E should begin early. They recommend two intramuscular injections a week, beginning soon after the cessation of the menses and continuing into the seventh month of pregnancy. In the intervals between the intramuscular injection the vitamin is to be given by mouth. The simultaneous administration of progesterone is advisable in cases of habitual abortion. In many cases of hypogalactia the milk secretion can be increased by the administration of vitamin E two or three times a week by intramuscular injection, and daily by mouth. Impaired potency and azoospermia are likewise favorably influenced by vitamin E, even in cases refractory to hormone therapy. The authors recommend simultaneous administration of vitamin E and androgen. In cryptorchism the combined administration of gonadotropic substance and of vitamin E is recommended in order to effect the descent of the testes. Gonadotropic substance is injected daily or every second day and vitamin E is given daily by mouth. This treatment is continued for from two to four weeks. Neuromuscular disturbances, particularly muscular dystrophy, can be noticeably improved by intensive treatment with vitamin E. Injections of the vitamin should be given daily or every other day and in addition the vitamin should be given by mouth.

Subcutaneous Injury of the Intestine. G. B. Logvinskiy.—p. 49.

Subpectoral Phlegmon.—Noshchinskiy calls attention to the fact that deep subpectoral phlegmon frequently evades recognition. Thus, of the 72 cases admitted to his clinic, 12 were directed with the diagnosis of grip, 2 with that of pneumonia, 1 as rheumatoid arthritis, and 1 as acute inflammation of the shoulder joint. The portal of entry was definitely established in 38. These are to be looked for in superficial inflammatory processes of the upper extremity, most frequently in the fingers. The condition is essentially a grave type of an acute inflammatory process of the lymph nodes and the cellular tissue of the axilla. The local symptoms are slight and are obscured by the general septic condition. Certain tender points are present, in the author's experience, early in the course of the infection and are important aids to diagnosis. These are

a point of tenderness just below the clavicle 1 cm. inside the anterior axillary line and another in the second intercostal space lateral to the midclavicular line. There are tenderness and spasm of the pectoralis major muscle and limitation of movements of the shoulder joint. Treatment consists of early and radical incision along the lower border of the pectoralis major, followed by incision of the pectoral and the coracoaxillary fascias in order to expose the deep subpectoral space.

Practical Ruler for Frequency Estimation in Electrocardiogram. M. Kobra.—p. 57.
Behavior of Takata Reaction in Myeloma. T. Hafström.—p. 61.

Electrocardiographic Studies in Scarlet Fever.—Roelsen made electrocardiographic studies of 216 scarlet fever patients in order to determine whether the cases accompanied by arthralgia were more frequently complicated by myocardial changes than those without arthralgia. There were 9 patients among the group whose electrocardiographic changes were explainable on other preexisting grounds. Changes in the electrocardiograms were found in 65 of the 207 remaining patients. This substantiates the previous observation that such changes were frequent in scarlet fever. The changes occurred somewhat more frequently in the arthralgic group (in 39 of 108 patients) than in the group (in 26 of 99) without arthralgia. The changes were delayed auriculoventricular conduction in 20 cases, Wenckebach arrhythmia in 1, modal rhythm and changes of the ST interval and of the T deflections in 49. A few instances of an abnormal archlike course of ST₂, extrasystole, deep Q₃, left sided preponderance, deep S₁ and inverted P₂ were encountered. The changes appeared virtually at all times during the course of the disease. The changes, as a rule, were transitory, but in isolated cases they persisted for several months. The gravity of the patient's condition on admission scarcely afforded a clue with regard to the eventual appearance of changes in the electrocardiogram, while the rise of temperature may in some degree be premonitory of it. The ordinary complications were of fairly equal incidence in patients with and without electrocardiographic changes. In general the changes are not attended by subjective heart symptoms or objective signs of congestive heart failure. Auscultation frequently revealed atypical systolic murmurs and, in isolated cases, a slight dilatation. The electrocardiographic changes and the auscultatory signs did not parallel each other. The severe, somewhat more persistent changes are probably due to pathologic changes in the myocardium. The slight or transitory changes are possibly due to a purely toxic influence on the cardiac muscle or to an allergic reaction. For the present it will probably be correct to qualify the changes as a mere myocardial involvement (verified by electrocardiography). On comparing the electrocardiographic changes observed in scarlet fever with those found in rheumatic fever, points of resemblance between the two are seen. However, the electrocardiographic changes in rheumatic fever are usually far more serious and persistent than those in scarlet fever. Yet the difference in the two diseases is probably only quantitative. The greatest difference between the cardiac complications attending the two diseases is the frequent occurrence of endocarditis in rheumatic fever and its rarity in scarlet fever, when it is merely an expression of "overlapping" between the diseases. The electrocardiographic changes are evidently not specific for either disease. During recent years similar electrocardiographic changes have been reported in a number of different infectious diseases: influenza, pneumonia, typhus and tonsillitis. Diphtheria often entails pronounced myocarditis, in many cases with severe, persistent and pronounced electrocardiographic changes. If changes are not detected in convalescents after infectious diseases, they will often appear after physical exercise tests. Electrocardiography has added to empiricism an objective criterion.

Book Notices

Economy in the Use of Drugs in War-Time. With an Appendix Giving a List of Drugs of Which Production Within the British Empire Should be Encouraged. Medical Research Council: Therapeutic Requirements Committee: War Memorandum No. 3. Paper. Price, 10 cents; 3d. Pp. 18. New York: British Library of Information; London: His Majesty's Stationery Office, 1941.

The problem of economy in the use of drugs in war time is of major importance when a restriction of importations arises or appears imminent. The Therapeutic Requirements Committee was appointed in September 1939 by the Medical Research Council in consultation with the Ministry of Health to "consider the question of essential drugs to be used under war conditions and to give guidance to those responsible for insuring the supply of these." The list of drugs included in the booklet is based on the British Pharmacopeia 1932, including Addenda 1936 and 1940, and on the British Pharmaceutical Codex 1934 and are classified as follows:

- A. Drugs which are at present either
 1. Regarded as essential or
 2. Readily available
- B. Drugs which are essential for certain purposes but not for others and in the use of which strict economy should be observed.
- C. Drugs which are not essential and do not justify importation or manufacture for home use in war time.

Approximately five hundred drugs are classified with a substitute or equivalent given wherever possible, and they are subjected to pertinent remarks as to control, countries of origin and the possibility of production in the United Kingdom and in the British Empire. The omission of proprietary names wherever possible indicates that the use of nonproprietary medicaments is favored.

An appendix lists the drugs which the committee recommends for production within the British Empire and may interest those in this country who are directing their attention toward the domestic sources of botanicals. The United States is unique in its possession of varied soils and climate, and the possibilities of home production of botanicals have not yet been fully explored. As during the World War period, the increase in prices may do much to offset the cost of production and marketing, thus favoring further explorations in this interesting problem of home production and substitution.

Williams' Obstetrics: A Textbook for the Use of Students and Practitioners. By Henry J. Stander, M.D., F.A.C.S., Professor of Obstetrics and Gynecology, Cornell University Medical College, New York. Eighth edition. Cloth. Price, \$10. Pp. 1,401, with 704 illustrations. New York & London: D. Appleton-Century Company, Incorporated, 1941.

The most striking thing about the new edition of Williams' classic book is its size. The present edition contains one thousand, four hundred and one pages (the seventh edition contained one thousand, two hundred and sixty-nine pages). Some of this space could have been curtailed. About one hundred and sixty pages are devoted to lists of literature and sixty-two pages are taken up by the index. Eight closely printed pages in small type are given over to the theories of the origin of eclampsia. Likewise ninety-six pages are allotted to the section on contracted pelvis. This is too long, especially in view of the fact that many of the abnormalities discussed and illustrated are extremely rare. The section on the toxemias of pregnancy occupies eighty-one pages, including twelve pages of references. Perhaps the sections on contracted pelvis and toxemias are large because Williams was particularly interested in the bony pelvis and Stander has for many years devoted considerable effort to the study of the toxemias of pregnancy.

The book shows evidence of extensive rewriting. Chapters have been rearranged and three new ones added on diseases and abnormalities of the newborn child, classification of abnormal and contracted pelvis and sudden death and maternal mortality. In the section on the mechanism of labor the author has made changes to conform with the recent roentgenologic observations of Caldwell, Moloy and d'Esopo and Thoms. Likewise a new classification of contracted and abnormal pelvis is proposed and a good deal of space is devoted to roentgenologic pelvimetry, which is discussed in detail. In the section on the toxemias of pregnancy, the new classifica-

tion of the American Committee on Maternal Health is included. The chapter dealing with the urinary tract was rewritten, and special consideration was given to the use of the sulfonamide group of drugs for the treatment of pyelitis. Likewise the chapter on endocrinology was rewritten to include the newer developments in this field. In the discussion of the treatment of puerperal infection the newer concepts of chemotherapy are taken into consideration. The chapter on amnesia, analgesia and anesthesia in labor deals with practically all the drugs and gases which are used during labor, and the author even mentions hypnosis. Stander is now employing direct infiltration more often than he has in the past. In the resuscitation of newborn babies he prefers special apparatus for the administration of carbon dioxide and oxygen rather than the simpler tracheal catheter. Throughout the book the recommendations made concerning treatment are just as conservative as they have been in the past.

As in previous editions the illustrations are beautiful and highly instructive. A large proportion of the illustrations are entirely new and were made by Elizabeth Brödel.

This book, which was originally and is still based principally on Williams' extensive experience in obstetrics, is now brought down to date by the addition of Stander's laboratory and clinical experience in this field. The book is a tribute to the faithfulness and ability of Stander and because of this it remains one of the leading textbooks in obstetrics in the world.

The Extra-Ocular Muscles: A Clinical Study of Normal and Abnormal Ocular Motility. By Luther C. Peter, A.M., M.D., Sc.D., Consulting Ophthalmologist in the Rush Hospital for Consumption and Allied Diseases, Philadelphia. Third edition. Cloth. Price, \$4.50. Pp. 368, with 152 illustrations. Philadelphia: Lea & Febiger, 1941.

The first edition of this book was reviewed in these pages on April 14, 1928 and the second edition on Oct. 24, 1936. The demand for a third edition thus indicated speaks more for the caliber of the work than can the few hundred words allowed to a review. There hasn't been much change in our knowledge of the anatomy and physiology of the muscles during the fractional part of a generation covered by the span of these three editions. The author's knowledge of various phases of heterophoria has not changed materially, but the general ophthalmologist is beginning to know more about the subject, and consequently the logical sequence in which this chapter is written will undoubtedly have wider application. In the review of the last edition it was pointed out that the author of the book states unequivocally that the amblyopia of a squinting eye is due to disuse. This view is not universally held. The major changes in this edition are an enlargement by twelve pages, the addition of eleven illustrations, and a slight rearrangement of textual matter. The book still deserves the closing phrase of the reviews of the two previous editions: The text is excellent and practical, the illustrations are good and really illustrative, and the book making and binding are satisfactory. This is a book every ophthalmic student and practicing ophthalmologist can read with profit and pleasure.

Electrocardiography in Practice. By Ashton Graybiel, M.D., Instructor in Medicine, Courses for Graduates, Harvard Medical School, Boston, and Paul D. White, M.D., Lecturer in Medicine, Harvard Medical School. Cloth. Price, \$6. Pp. 319, with 272 illustrations. Philadelphia & London: W. B. Saunders Company, 1941.

The important role that electrocardiography is coming to play in clinical medicine is exemplified by the rapid succession of books on electrocardiography, of which this one by Graybiel and White is the most recent. It follows the plan already established in several preceding books of presenting the electrocardiograms on one page with their description and the clinical story of the patient on whom they were taken on the opposite page. Of the books of this style this is probably the best. The format is excellent and the illustrations are beautifully reproduced. The book is divided into two parts. In the first the authors present a running account of the normal and abnormal electrocardiograms in various circumstances illustrated with one hundred and forty-two electrocardiograms. In the second part they present a series of one hundred and thirty unknown electrocardiograms together with their interpretations. This is not a textbook, as the authors point out, but rather a guide in the practice of electrocardiography. The theory of the electrocardiogram is presented superficially and not entirely

accurately. The importance of the newly established chest leads is not sufficiently stressed, and the description of the chest leads is incomplete. Undue emphasis placed on the electrocardiographic appearances in various diseases in which the changes are not specific makes it more difficult for the reader unaccustomed to electrocardiography to become properly oriented as to its importance in disease. This book exemplifies the tendency prevalent among some electrocardiographers to read the record as a supplement of the clinical picture rather than to read the electrocardiogram first objectively and then to make the correlation. It would have been better to begin with the electrocardiographic description and objective interpretation before giving the clinical story and the correlation between the electrocardiogram and the latter. There are a number of other errors of a minor sort which need not be detailed. On the whole this is an excellent book, and the reader will find that its perusal will help him to appreciate the manner in which the Boston school interprets electrocardiograms and should therefore be of considerable assistance to him in dealing with his own records.

A Manual of Embryology: The Development of the Human Body. By J. Ernest Frazer, D.Sc., F.R.C.S., Professor of Anatomy in the University of London, London. Second edition. Cloth. Price, \$9. Pp. 523, with 282 illustrations. Baltimore: William Wood & Company, 1940.

As the reaction of students to a textbook is frequently different from that of their teachers, the reviewer has given this book to several of his advanced students for examination. They agree that complex developmental processes are described clearly in it; one student praised the number of three dimensional drawings but felt that they would be better with more labels.

The reviewer has found this to be a readable, accurate but relatively elementary presentation of mammalian and especially human embryology. The gross and topographic aspects of embryonic development are stressed. The book lacks the emphasis on the microscopic appearances during development which are found in most of the American textbooks. The book would be improved with more references to the literature. There are two opinions on this question; the reviewer happens to feel that, as long as the content of a scientific book is subject to revision through continued observation and experiment, at least leading references should be included for several reasons: 1. The presence of the reference may stimulate the student to read the source material. 2. It shows the instructor the basis for some of the opinions expressed implicitly or explicitly in the text. 3. Most importantly, the failure to give references—and contradictory references at that—too often is likely to induce in the student a feeling of dogmatism about the material being studied. This is highly undesirable in all the biologic disciplines, including embryology. One of the main purposes of a textbook should be the inculcation of how little is known in the mind of the student. There is probably no better way of doing this than by the presence of numerous references to opposing points of view. Some teachers will object to this, as they believe that the student has a sufficiently heavy task in learning the "what" and should not be bothered by the "who thought so" and who did not.

A suggestion for future revisions of this and other textbooks of embryology: The presentation of embryology from a descriptive point of view is insufficient. A modern presentation must include many of the important and dramatic accomplishments of experimental embryology.

Undersøgelser over den tilsyneladende primære exsudative Pleuritis Klinisk med særligt Henblik paa Prognosen. Af Erik Strandgaard. [Studies on Clinical Aspects of Seemingly Primary Exudative Pleurisy, with Special Consideration of Prognosis.] Denne Afhandling er af det lægerfakultet antaget til offentlig at forsvares for den medicinske Doktorgrad København, 1940. Paper. Price, 15 Danish kroner. Pp. 153, with 10 illustrations. Copenhagen: Ejnar Munksgaards Forlag, 1940.

This is an academic doctor's thesis in Danish with summaries in German and English. The earlier literature on problems of pleurisy is reviewed and a detailed account is given of some 986 hospital cases of apparently primary exudative pleuritis and of the results of the follow-up and reexamination of the surviving patients some six years after the primary attack. A good general picture of the disease is given as it occurs in the population of Copenhagen, with special emphasis on the prog-

nosis. In 309 cases the pleuritis was unquestionably tuberculous and most of the remaining save 14 also seemed to be tuberculous. The thesis embodies the outcome of thorough, well planned work for several years and is a valuable contribution to the clinical study of primary exudative pleuritis.

Practical Orthoptics in the Treatment of Squint (Including Heterophoria, Paralytic Squint and Ocular Torticollis). By Keith Lyle, M.A., M.D., M.Chir., Assistant Ophthalmic Surgeon, King's College Hospital, London, and Sylvia Jackson, Senior Orthoptist, Royal Westminster Ophthalmic Hospital, London. Foreword by Charles Leonard Gimblett, M.A., M.D., M.R.C.P., Surgeon, Royal Westminster Ophthalmic Hospital, London. Second edition. Cloth. Price, \$4; 15s. Pp. 341, with 101 illustrations. Philadelphia: Blakiston Company; London: H. K. Lewis & Co., Ltd., 1940.

The first edition of this excellent practical manual for orthoptic students appeared in 1937. With the appearance of the second edition, which was ready for publication at the outbreak of the war in September 1939, the subject has been thoroughly brought up to date. Much additional matter has been included which has increased the size of the book. A chapter is added on the etiology of strabismus taken largely from Chavasse's revision of Worth's Squint. A new chapter on adult cases of squint has been added, and much additional information has been included in the chapters on paralytic squint and on ocular torticollis. In 1937 the authors recommended that an orthoptic board should be devised to examine and certify nonmedical orthoptic technicians. In 1939 such a board was formed in this country and is now functioning efficiently with yearly examinations for technicians. The orthoptists of the principal schools have outlined a standard of cure in order to facilitate the comparison of their results. It has been incorporated in this edition and has been carefully adopted in the ruling of the author's results. An appendix is added giving an outline in tabular form of all cases treated and investigated in the orthoptic department of the Royal Westminster Ophthalmic Hospital in the course of the year 1938. This study gives some idea of the incidence of the different types of squint and heterophoria, the length of treatment received and the results to be expected. The book making and illustrations adhere to the high standard set by the first edition. Not only is this book an excellent manual for orthoptists, but it can be highly recommended for all practicing ophthalmologists.

Your Career in Nursing. By Cecilia L. Schulz, R.N. Cloth. Price, \$2. Pp. 205, with 8 illustrations. New York & London: Whittlessey House, McGraw-Hill Book Company, Inc., 1941.

This book contains chapters on nurses and nursing—a panoramic view, what it takes, nursing schools—and nursing schools, and six other equally important well selected subjects. It is written especially for those who are contemplating nursing as a career. It gives a good idea of what nursing is like. A vein of well directed humor helps the reader to get the point clearly. The information given throughout the book is reliable. A person who is considering nursing for a career will be assisted in making up her mind by reading this book.

Testing Respiratory Protective Equipment for Approval. By H. H. Schrenk, Chief Chemist, Health Division, Bureau of Mines, Pittsburgh. United States Department of the Interior, Bureau of Mines. Information Circular 7130. Paper. Pp. 9. Washington, D. C., 1940.

When the U. S. Bureau of Mines was established in 1910 it was provided that among its duties were to be investigations "in relation to the safety of miners and the appliances best adapted to prevent accidents . . . and from time to time to make reports of investigations." The information circular is one of seven thousand, one hundred and thirty such reports. It first distinguishes and defines the various forms of atmospheric contamination occurring in mines, such as gases, toxic and inert (oxygen deficiency); dusts, fumes, mists formed by disintegration, and fogs formed by condensation. It then describes the various forms of protective devices, such as gas masks specially arranged against each atmospheric contaminant; self-contained oxygen breathing apparatus; hose masks, and helmets for protection against abrasives and blasting. The requirements established by the bureau for each type of equipment are described and the tests which each must meet before gaining the approval of the bureau. Such reports are a public service of a high order; they have led to steady improvement in the quality of protective devices and thereby to the saving of life.

ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

ARMY SERVICE AFTER ACUTE GLOMERULAR NEPHRITIS

To the Editor:—A man aged 30, who has recently recovered from an attack of an acute diffuse glomerular nephritis following pharyngotonsillitis, desires to volunteer for service in the army. During the six weeks of hospitalization the patient showed the usual urinary conditions, slight azotemia and mild hypertension. At present (four weeks since his discharge from the hospital) the patient feels quite well apart from occasional headaches; his urine shows no abnormalities; however, he does have persistent, mild hypertension, the blood pressure varying between 130 systolic and 90 diastolic and 150 systolic and 100 diastolic. Would service in the army, with its necessary exposure to cold and damp, be detrimental to my patient's future health? Would such a patient be deferred from the Selective Service Act or classified as "disabled?"

M.D., New York.

ANSWER.—Following an attack of acute glomerular nephritis there is a prolonged period of undetermined length but certainly lasting many months or years—the so-called latent period—in which all active signs and symptoms of the disease may have disappeared but during which the patient still remains susceptible to the remote effects of his former disease. It is during this period that the eventual course of the disease is determined; that is, whether the latent stage progresses successfully to a healed condition or whether it tends to become active and the patient suffers either hypertensive cardiovascular disease or a recurrence of nephritis with the possibility of malignant hypertension.

For these reasons the patient should be given every consideration of a period of eighteen to twenty-four months following the termination of all active signs of nephritis. This means refraining from fatigue or undue exposure to chilling, the avoidance of rapid changes of temperature and the use of a diet adequate in caloric value as well as in the supplemental vitamin content.

It is possible that such a diet might be obtained in the army, but probably the other factors would be lacking, especially since the patient mentioned has a moderate elevation of blood pressure. Service in the army would be detrimental, and he should be classified as deferred until the final course of his disease is known. Naturally decisions vary according to draft boards, and with these facts in mind no person in this stage should be allowed to volunteer, nor should he be subject to the draft.

BLOOD TYPE DOES NOT CHANGE

To the Editor:—About nine months ago I was typed for a blood transfusion, which was given with no ill effect to the patient. At that time my blood was in group O. Since that time it has continuously failed to match with that of several patients also in group O. Recently I had my blood retyped and now it is type A. I have heard that changes in the blood grouping of a person have occurred. I should appreciate information on the subject and references. I have been unable to obtain any satisfactory explanation.

M.D., Canal Zone.

ANSWER.—The blood groups do not change, remaining constant regardless of age, disease or environment (Wiener, A. S.: *Blood Groups and Blood Transfusion*, ed. 2, p. 139). In every reported instance of a supposed change in blood grouping the possibility of a mistake in grouping could not be excluded. In the hands of persons who are experienced in blood grouping, "changes" in blood groups do not occur. The fact that the inquirer's blood continuously failed to match with that of other patients of group O shows that the original grouping was wrong. There are several possible explanations for the successful transfusion, despite the original error in blood grouping. First, if a double error is made and patient and donor both belong to group A but have been incorrectly grouped as O, no harm would result. Secondly, transfusions of incompatible blood are occasionally symptomless (Wiener: *Blood Groups and Blood Transfusion*, p. 91). Group A offers a special pitfall in grouping which seems not to be generally known, namely the existence of two sorts of A agglutinin, A_1 and A_2 . Weak grouping serums may be strong enough to agglutinate A_1 cells but may fail to clump blood of subgroup A_2 , and in that way blood of the latter subgroup can be mistaken for group O.

IMPREGNATION AFTER VAS LIGATION

To the Editor:—A patient had bilateral vas ligations in 1935. He and his wife now want another child. An unsuccessful attempt has been made to reunite the vas on one side. Kindly send instructions or literature on testicular aspiration and insemination. They do not care to use a donor other than the husband.

M.D., Kentucky.

ANSWER.—The operation to restore the lumen of the vas after vasectomy is rarely successful. The more thorough the original operation was, the more difficult it is to restore the lumen and the more uncertain is the result.

The procedure of producing impregnation of the wife by injecting into her uterus fluid obtained by aspiration of the husband's testes is almost universally a failure. The procedure works in animals on which one can use a large trocar but fails in the human being, on whom one must employ a rather fine aspirating needle with which relatively few spermatozoa (certainly less than one hundred) can be obtained.

Huhner (*The Diagnosis and Treatment of Sexual Disorders in the Male and Female Including Sterility and Impotence*, ed. 2, Philadelphia, F. A. Davis Company, 1939, p. 25) has followed this procedure in a number of cases but without any successful results. Rohleder, sexologist, of Leipzig at one time reported a successful result but later on discovered that the wife had used this occasion to indulge in extramarital coitus, the husband believing that the child was the result of the artificial impregnation. Other investigators likewise have failed to obtain any results. However, Walker (*Male Disorders of Sex*, London, Jonathan Cape, 30 Bedford Square, 1930, p. 177) mentioned a successful artificial insemination done by C. H. Mills, a London surgeon, but gives little detail. Possibly the Hagner operation of epididymovasostomy may be tried in this case, as it is at times successful in pathologic closure of the tubes as a result of previous gonorrheal epididymitis.

GASTROINTESTINAL HEMORRHAGE AND CARBON MONOXIDE POISONING

To the Editor:—Recently a woman reported for examination because of gastrointestinal hemorrhage following exposure to carbon monoxide. She had some distress about thirty or forty minutes after meals. She was unable to say whether alkalis or food relieved the pain. The roentgenologist could find no evidence of any lesion in the gastrointestinal tract. Could the exposure to carbon monoxide be responsible for tarry stools from a lesion too small to demonstrate with the roentgen ray and if so what is the prognosis?

A. A. Skemp, M.D., La Crosse, Wis.

ANSWER.—This query fails to provide essential information as to the extent of carbon monoxide asphyxiation. If it may be assumed that actual and somewhat prolonged unconsciousness from carbon monoxide occurred, small gastrointestinal hemorrhages shortly thereafter might arise. This is more likely in elderly persons. Such hemorrhage results from direct injury to the capillaries and other small blood vessels of the gastrointestinal tract. If asphyxiation persisted for one hour or more, such minor hemorrhage is not a rarity, but if the carbon monoxide injury was trivial, hemorrhage is not to be expected. In any event, damage is transient and the prognosis with regard to gastrointestinal hemorrhage is good. If tarry stools or other evidences of gastrointestinal tract hemorrhage persist, a cause other than carbon monoxide should be sought.

AGGLUTININS AFTER TYPHOID VACCINATION

To the Editor:—What is the significance of positive typhoid agglutinins when the patient has had typhoid vaccinations within the past four or six months? After five months is an agglutination of 1:640 unusual? Would a lapse of two weeks from the time the last injection was given be sufficient time to give an agglutination titer of 1:120 in the O antigen?

H. S. Hickman, M.D., Fort Lewis, Wash.

ANSWER.—Both H and O agglutinins are formed by man in response to immunization against typhoid. (It is now well known that earlier statements to the effect that O antibodies are not formed are incorrect.) The H titers are generally relatively high, almost always over 1:500 and frequently well over 1:1,000 or 1:1,500. These titers fall off rapidly, and by six months after immunization a titer of 1:1,000 is not common, but they may persist at moderate levels, i. e. 1:50 to 1:250, for a number of years. The maximum O titers are much lower, usually 1:80 to 1:320 and rarely as high as 1:640. They fall off even more rapidly than the H titers; as a rule they are only moderate by the end of six months, perhaps 1:20 to 1:100. At the end of a year many persons show no agglutination at 1:20, although in others low titers may persist for several years. The immunologic response, as measured in terms of H and O agglutinins, is then highly variable both as to titers attained and as to their persistence.

In the case of inoculated persons the diagnostic value of agglutination is by no means clear. Felix has urged that O agglutination is the more valuable because of the more rapid disappearance of the somatic agglutinins, but this is not well established. Similarly, the extent to which the amnestic reaction occurs in febrile conditions is not definitely known; some data suggest that it is significant, while others do not. In spite of this there is some evidence that the "agglutination curve," obtained by repeated agglutination tests during the course of the disease, may have diagnostic value. In general, any attempt to set up arbitrary agglutinin levels as "diagnostically significant" confuses rather than clarifies the issue.

An H agglutinin titer of 1:640 five months after immunization is not unusual.

A lapse of two weeks after the last injection is ample to give an O titer of 1:120. For example, Mudd (*J. Immunol.* 23:81 [July] 1932) has observed that ten days after the third injection of typhoid vaccine the O titer varied from 1:80 to 1:320.

MIXED TUMOR OF MOUTH

To the Editor:—Can you describe the recognized treatment for an extensive mixed tumor springing from the mucous membranes covering the superior maxilla? This tumor has been subjected to examination by a competent pathologist and was diagnosed as a mixed tumor. The tumor has eroded the mucous membranes of the entire roof of the mouth and has invaded the right antrum. The tissue subjected to examination contained cartilage and connective tissue cells, fully differentiated, and considerable stroma. On gross inspection the mucous membranes covering the hard and the soft palates are completely eroded to within one-fourth inch (0.6 cm.) of the gums. There is a grayish pink ulcerated base with islands of necrosis. The tissue feels rubbery but did not bleed easily when specimens were taken for biopsy. Beyond the ulcerated area the mucous membrane is pushed forward by the tumefaction beneath, but there is no fluctuation—only the rubbery, indurated sensation on pressure. Kahn and Wassermann tests on two different occasions have given negative results. The duration of the lesion has been about two years, and it is gradually growing larger.

M.D., New York.

ANSWER.—The lesion described in the question is probably a mixed tumor of aberrant salivary glands. From the description the tumor is apparently extensive. It is not possible to make a definite statement on the operability of such a lesion without a careful study of the patient, the roentgenograms and the microscopic slides. Since the right antrum is already invaded, it would seem that the lesion is in all probability inoperable. Intensive irradiation should be considered. If the floor of the antrum is already destroyed, complete sterilization of the lesion even by adequate irradiation may not be possible; in that event a palliative result may be expected. Although these tumors have generally been regarded as radioresistant, complete sterilization has been obtained recently by the use of more intensive irradiation than has hitherto been employed.

PHOTOGRAPHIC CHEMICALS AND BLEEDING GUMS

To the Editor:—Please advise if contact with any of the following chemicals used in the photographic industry is known to cause inflamed, spongy, bleeding gums: paraphenylenediamine, metol, hydroquinone, diethylene glycol, sodium carbonate, potassium bromide, sodium sulfite, glacial acetic acid and ammonia. I would appreciate references.

J. S. Abrams, M.D., Chicago.

ANSWER.—All or nearly all of the substances listed are cutaneous irritants, and a few are outstanding in this respect. Further, some of the chemicals mentioned are known to be irritants of the conjunctiva and the membranes of the respiratory tract. None are known to attack the gums in a specific or solitary manner, although damage to the gums in the presence of irritation to the conjunctivas or to nasal and pharyngeal membranes would not be remarkable. Of course if any of the chemicals specified are utilized in retouching work involving the objectionable practice of pointing a brush in the mouth the situation would be different. Apart from the chemicals listed, it may be noted that at least two unlisted ones are capable of producing inflamed, bleeding gums. These are mercury compounds and benzene, both applied in some aspects of photographic work. Mercury vapors in the atmosphere may be determined by means of the selenium sulfide apparatus as described by Nordlander (*Indust. & Engin. Chem.* 19:518, 1927). Any quantity of mercury in excess of 1 mg. in 10 cubic meters of air may prove the source of injury and the cause of the gingivitis. Benzene vapors are determined with greater difficulty, but any repeated use in photographic work should prompt suspicion of poisoning with benzene. On examination of the blood, leukopenia and anemia are suggestive. The carrying out of urine sulfate tests as described by Yant and others (*J. Indust. Hyg. & Toxicol.* 18:349, 1936) may be of value.

The health of workers in photographic darkrooms is frequently impaired by the lack of proper ventilation, the absence of sunlight and exposure to mixed vapors and gases usually present. It is possible in the present instance that general disease of a systemic nature may be related to the disorder described instead of its causation being sharply connected with any one chemical employed at work.

TRUSS FOR HERNIA

To the Editor:—A man aged 55, whose general condition is such that operation presents risks, has a pantaloon type hernia on the right side with one sac presenting through the femoral ring and the other protruding as a direct inguinal hernia. Both are rather large, and when the inguinal region is compressed the femoral region bulges and vice versa. This condition is unique in my experience, and I am having great trouble in finding and fitting any type of apparatus that will properly support the two hernias at the same time and will allow sitting and rising and operating an automobile. Can you advise me as to a satisfactory support for this condition?

M.D., Virginia.

ANSWER.—It is difficult, if not impossible in some instances, to differentiate an inguinal from a femoral hernia. In order to fit a patient properly with a truss one must decide whether the condition is a double inguinal hernia (direct and indirect) or an inguinal and a femoral hernia together. A femoral hernia turns up over Poupart's ligament and lies in the region of the external ring and hence is easily confused with an inguinal hernia. However, if the hernia can be reduced it will at once be apparent what the condition is, and if the hernia cannot be reduced a truss should not be applied.

To retain a bifid hernia of this nature, the best method is a well made support with correct thigh control for the femoral hernia. Into this support two laparotomy pads must be correctly placed so as to give uniform pressure in all the actions of the patient. It is necessary to give measurements as for an abdominal support, and measurements of thigh at crotch, also how large a protrusion exists when both hernias are out.

PLASTER CASTS IN TREATMENT OF BURNS

To the Editor:—Please give me any information possible on the use of plaster casts in the treatment of burns. C. B. Thomas, M.D., Norwalk, Ohio.

ANSWER.—The use of plaster casts has been advocated in the treatment of burns, and successful results have been reported. A plaster cast is applied after using cod liver oil ointment; this treatment is reported in the German literature (Wichmann, F. W.: Unguentolan [cod liver oil ointment] and Plaster Casts in the Treatment of Burns, *Zentralbl. f. Chir.* 66:655 [March] 1939). One of the several advantages of the plaster dressing is covering the wound, putting the part at rest and minimizing the dressings, which may result in secondary infection.

A mixture of cod liver oil and petrolatum is applied to the burned area and a glazed cotton dressing placed over the mixture and then a light plaster cast applied, immobilizing the joint above and below. When there is the possibility of contracture, the extremity may be overextended and kept overextended for a period of three weeks. The light plaster casts applied are removed at the end of one week, at which time there may be present a foul odor. The mixture of cod liver oil and petrolatum is then reapplied in addition to the application of a light plaster dressing. This type of treatment has also been reported by Alfonso (Zino Method of Immobilization in Plaster Casts, *Arg. brasil. de cir. e ortop.* 6:302 [Sept.-Dec.] 1938).

TRANSMISSION OF HEART SOUNDS TO CHEST WALL

To the Editor:—What condition would cause the heart sounds and systolic murmur at the aortic valve area to be distinctly transmitted over the whole right side of the chest? Vocal fremitus is also increased on the right side. The percussion note is not much different from that on the left side.

H. M. Metcalf, M.D., Hendrysburg, Ohio.

ANSWER.—The question does not state whether cardiovascular disease has been ruled out. An aortic aneurysm might produce the condition described. It is not likely that aortic valve disease or simple aortitis would be associated with increased vocal fremitus. If cardiovascular disease can be ruled out one must consider any cause that would produce consolidation or compression of the lung with impingement on the base of the aorta. The heart sounds and the vibrations of the aorta might be widely transmitted along a solid medium. Such a cause might be mediastinal glands or a tumor. Extensive fibrosis of the lung would serve. Tumors of the lung properly placed must be considered, as must tumor of the pleura. Pleural adhesions are possibilities. A congenital malformation, such as coarctation of the aorta, is possible but unlikely. Roentgenograms of the chest taken at various angles should prove helpful.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE

DEPARTMENT, JANUARY-JULY, 1941

Titles have been listed or Abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past six months. Any of the journals, except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1931. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation; "E," Editorial; "C," Correspondence; "OS," Organization Section; "SS," Student Section; "ab," abstracts; the star (*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." State board examinations are entered under the general heading State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 2955.
